gradual and is followed by nausea, loss of appetite, headache, pains in the back and extremities, nosebleed, and perhaps a distinct chill. For a few days the patient may go about his work, but at the end of that time is compelled to go to bed. This may be reckoned the definite onset of the disease. The fever is characteristic. During the first week the temperature rises steadily by a degree or a degree and a half a day until 103° to 105° F. is reached; during the second week the fever remains high; during the third week, in cases of moderate severity, it gradually declines, and in the fourth week convalescence begins. About the seventh to the tenth day the patient presents the typical appearance of enteric fever. He is dull, listless, and apathetic, the eyes are bright, the pupils dilated, the face pale, with flushed cheeks and dark lips. The tongue is dry and red, with a band of white fur on each side. At the end of the first week a rose-pink rash appears on the abdomen. It consists of from 10 to 30 raised circular spots, which fade on pressure. These spots last only two or three days, but successive crops appear. The abdomen is distended and tender, and several offensive yellow stools may be passed daily. Death may occur at the end of the second week, from hemorrhage or perforation of the bowel. The third week is marked by great weakness, muscular tremors, delirium, and failing heart, although the fever is slowly dropping, and death may take place from exhaustion. Convalescence in the average case sets in during the fourth week. In a certain number of cases relapses occur; these are, as a rule, shorter and milder than the original attack, but are similar in character. One attack of enteric fever confers immunity from others. The mortality ranges from 10 to 30 per cent.

To prevent the spread of typhoid the following precautions are observed. The stools and urine of patients are thoroughly disinfected by immersion in strong solutions of corrosive sublimate, carbolic acid, or chlorinated lime and protected from flies. In districts having a defective drainage system the dejecta may finally be disposed of by mixing with sawdust and burning or burying in trenches after saturation with chloride of lime. Bedpans, rectal thermometers, syringes, tubes, and all other utensils coming in contact with the patient's discharges are disinfected by boiling and immersion in antiseptic solutions. Bedclothes and linen are similarly disinfected. During epidemics drinking water and milk should be boiled and raw vegetables such as lettuce and celery avoided.

Careful nursing and regulated diet are of first importance in the treatment. The patient is strictly confined to bed from the beginning of the disease until the temperature has been normal for at least a week. A liquid or semisolid diet has been found best throughout the course of the attack. The modern tendency is to feed the patient more liberally than in the past. Broths, consommé, albumin water, and beef juice are given to vary the diet. Milk should be peptonized or mixed with lime water or vichy. The patient is urged to take plenty of cool water, and the juice of an orange or lemon may be given at intervals. Food is taken about every three hours during the day, and once or twice at night if there is great exhaustion.

Control of the fever is the most important element in the direct treatment of typhoid, and

this is best accomplished by means of cold water, by sponging, the wet pack, and bathing. Sponging is sufficient in ordinary cases and for children and delicate persons. The cold pack consists in wrapping the patient in a sheet wrung out of water at 60° or 65° F. The full bath, or cold tubbing, was introduced by Brand of Germany, and this treatment was formerly almost universally followed in hospitals. Of late years, however, it has lost favor on account of its severity.

The drug treatment of typhoid is symptomatic. Cold sponging renders febrifuges unnecessary. Antipyrine and phenacetin are sometimes given, but they tend to depress the heart. Intestinal antiseptics, such as turpentine, salol, and carbolic acid, render the stools less offensive and prevent the production of gas. Return to solid food must be gradual on account of the danger of perforation through intestinal ulcers.

Widal's Test for Typhoid Fever. This is a reliable method of diagnosis, and depends upon the fact that the blood of typhoid-fever patients acquires the property of causing a reaction when brought into contact with active typhoid bacilli. In the test a small amount of blood or serum diluted is mixed with a fresh pure culture of the typhoid bacillus. The reaction, as observed under the microscope, consists in a destruction of the motility of the bacilli and their agglutination, that is, their collection into larger or smaller clumps. The reaction may not occur in the first stages of the disease. A positive result with quite dilute serum makes the diagnosis of typhoid almost certain, although the reaction does rarely occur in other diseases.

Paratyphoid fever is an infectious disease, clinically resembling typhoid, but milder and more irregular in its course. It is due to a specific bacillus or bacilli which occupy a position intermediate between the *Bacillus typhosus* and the *Bacillus coli*. It is sometimes called the paracolonic bacillus. Diagnosis is based on the agglutination test, the Widal reaction being negative.

Immunization against typhoid fever is conferred by the injection of a specific vaccine. Protection is fairly certain and immunity lasts, according to the latest available data, for two and a half years or more. Vaccination is practiced in all the armies of the civilized world, and the typhoid rate has been reduced at least 75 per cent by these measures. The value of typhoid vaccination is illustrated by the statistics of the first year of the European War. From the beginning of hostilities only 1365 cases of typhoid occurred among the British troops in France and Belgium, whereas in the Boer War over 20,000 cases occurred in a very much smaller number of troops. See *HYGIENE, Military Hygiene*.

lications of this bureau. See INFLUENZA IN ANIMALS.

TYPHOID FLY. See HOUSE FLY.

TYPHOON (Lat., from Gk. *Τυφών*), or **TYPHOEUS**. In Greek legend, the offspring of Gæa, or Earth, and Tartarus. He was a fire-breathing monster with 100 serpent heads, who after the overthrow of the Titans (q.v.) strove to wrest the power from Zeus. He was finally smitten by the thunderbolt and cast into Tartarus. By Echidna he was the father of many monsters who were destroyed by Hercules. Typhon seems to be the personification of the volcanic elements, and the scene of the conflict is at first in the volcanic regions of Lydia and Phrygia, and later about Ætna and Stromboli, while the description in Hesiod of the battle with Zeus is a vivid picture of a violent eruption. For the Egyptian Set-Typhon, who later influenced the Greek story, see SER.

TYPHOON (Portug. *tufão*, from Ar. Pers. *tūfān*, tempest, hurricane, from *tūfānidan*, to roar, cry out; cf. Gk. *Τυφών*, *Typhōn*, Typhon (q.v.); also Chin. *t'ai fung*, great wind, Formosan Chin. *tai fung*, typhoon). The name applied to the hurricanes that visit the waters east of Asia. From a meteorological point of view the typhoon is a special case of the cyclonic storm. Typhoons usually originate at about or east of the longitude of Guam and nearer the equator than Manila; they move towards the west or west-northwest, but gradually curve so that they often pass northward or northeastward along the coasts of China and Japan. Typhoons appear to be quite as severe on the average as the West Indian hurricanes; the barometer often falls lower at the centre, and the rainfall is probably heavier. Knowledge of the laws of typhoons is now sufficient to justify cautious predictions of their paths and the issuance of storm warnings to navigators. All the baguios and typhoons of the North Pacific Ocean have been classified as follows by Doberck, Algué, and Bergholz:

Group 1 occur between December and March; the storms originate between 5° N. and 12° N. and 145° E. and 143° E.; move at first towards the north-northwest; reach the vertices of their parabolic orbits in latitude 15° N.-19° N. and then turn towards the north-northeast.

Group 2 occur in April and May or October and November; originate between 129° E. and 147° E. and 5° N. and 12° N.; move towards the northwest; have their vertices in latitude 16° N.-21° N., and then move towards the northeast.

Group 3 occur between June and September; originate between 139° E. and 126° E. and 20° N. and 8° N.; move at first towards the northwest by north; have their vertices at 21° N.-25° N. and then turn to the northeast by east.

When typhoons reach the China Sea in the months of December to March they generally continue towards the east-northeast, and are lost in the interior of the country. Those that occur in the summer and spring months recurve much more frequently, attain higher latitudes, and are frequently destructive in Japan and adjacent waters; occasionally they continue moving northeastward until they reach Bering Sea or the Aleutian Islands.

Full details of typhoons are published regularly by the meteorological offices of Hongkong, Tokyo, and Manila, and their general tracks, together with occasional special studies, are

published on the Pilot Charts of the Pacific Ocean, published monthly by the United States Hydrographic Office. Consult José Algué, *The Cyclones of the Far East* (2d ed., Manila, 1904), and W. Doberck, *Law of Storms in the Eastern Seas* (4th ed., Hongkong, 1898).

TYPHUS FEVER (Neo-Lat., from Gk. *τύφος*, stupor, mist, vapor, smoke), **JAIL FEVER**, **SHIP FEVER**, or **SPOTTED FEVER**, **TYPHUS EXANTHEMATOUS**. An acute, specific, and highly contagious fever, endemic, and also prevailing in epidemics, especially in times of destitution and in the presence of overcrowding and bad ventilation. It is due to the presence of a bacillus discovered by Dr. Harry Plotz (q.v.) in 1915, the *Bacillus typhi exanthematici*, and is attended with no characteristic lesions of the tissues as in the case of typhoid fever, but with serious blood changes. The disease is carried by the body louse (*Pediculus vestimenti*) principally, but the head louse (*Pediculus capitis*) is also capable of transmitting it. It is ushered in by an abrupt onset, with marked nervous symptoms, rheumatic pains, rigors, and headache. A maculated eruption appears, most commonly on the fifth day of the disease, of slightly elevated spots, disappearing on pressure at first, afterward persistent and darker, and there is early prostration of the nervous and muscular systems. Delirium usually comes on during the second week. The fever terminates by a crisis, which occurs on or about the fourteenth day, after which recovery is very rapid.

In former centuries typhus fever was a common scourge, in times of war and famine, under the names of jail fever, camp fever, ship fever, and the like. The earliest accounts of the disease described epidemics in the sixteenth century in France, Italy, and Hungary; and the earliest description is credited to Fra Castorius of Verona (1580), in his work *De Contagione et Contagiosis Morbis*. The name typhus was specifically used by de Sauvage in 1760. Severe epidemics occurred in Europe during the seventeenth and eighteenth centuries. Willis (1686) in England gave it the name "Synochus putrida." The mortality was appalling and special hospitals were built for typhus patients. It is a disease of the temperate and cold zones and is due directly to overcrowding of people in uncleanly surroundings thus favoring communication through lice. At the present time the disease is limited to half-civilized countries and to the slums of seaport cities. Local outbreaks sometimes occur on ships, and in jails and poorhouses. The mortality in different epidemics varies from 12 to 20 per cent. It was for a long time confounded with typhoid fever (q.v.), but it differs from this in many ways.

During the epidemic of typhus which spread over Serbia in 1914-15, it is stated that every hospital, prison camp, barracks, and almost every home was invaded; and a conservative estimate puts the mortality at 135,000, including 30,000 Austrian prisoners. The first cases of the disease reached the port of New York between January 7 and May 2, by means of passenger steamers sailing mainly from Mediterranean ports. This was the first typhus visitation in 20 years and the cases in quarantine furnished material for Plotz's studies and established the identity of true typhus with the milder endemic form, which had been known as Brill's disease. Plotz made a vaccine which was used in Serbia and was thought to have some

value, at least in prophylaxis. In 1913 Nicolle induced the disease in a chimpanzee by injecting the blood of typhus patients; and succeeded in transmitting the disease from monkey to monkeys, by means of the body louse. The latter observation has been confirmed by Anderson, Goldberger, Ricketts, and others. Ricketts lost his life by contracting the fever in Mexico, where it is very prevalent and is known as tabardillo.

The treatment of typhus is symptomatic. As the disease is exceedingly contagious, patients are promptly isolated, placed in clean surroundings, and their clothes disinfected or sterilized by heat to destroy lice and their eggs. The high temperature is reduced by means of cold sponging, the cold pack, or bathing, and by the administration of quinine, antifebrine, or phenacetin. All patients are benefited by small doses of the mineral acids, and mild saline laxatives. For the headache and delirium cold applications to the head are indicated. Alcohol is used as a stimulant throughout the attack, to combat the great prostration. During convalescence such tonics as strychnine and quinine are most useful. The patient may be nourished by liquid foods. Consult V. C. Vaughan, "History and Epidemiology of Typhus Fever," in *Journal of the American Medical Association* (Chicago, May 29, 1915).

TYPICAL PHRASE (Lat. *typicalis*, from *typicus*, from Gk. *τυπικός*, *typikos*, relating to a type). In dramatic music, the recurrence of a theme or phrase to mark the similarity of the dramatic situation between the part where such a phrase occurs and the part where it was first heard. The typical phrase is essentially different from the leitmotiv. Whereas the leitmotiv constitutes the basic material and is employed in the same manner as a theme in a symphony, the typical phrase is only a quotation, and can do nothing more than recall a similar situation. See LEITMOTIV.

TYPOGRAPHICAL UNION OF NORTH AMERICA, THE INTERNATIONAL. The labor organization of the printers and those engaged in kindred trades, the oldest national trade union in the United States. It was organized in 1850 as the National Convention of Journeymen Printers, but assumed the name National Typographical Union in 1852, and the present name in 1869.

In organization the International Typographical Union is a typical industrial union. Provision is made for the separation of the different trades into trade district unions, which retain a large measure of autonomy, although they combine for purposes of defense, in each jurisdiction where there are unions of more than one trade, in allied printing trades councils. The International itself, however, strictly regulates the maximum hours of labor of all members, the number of days' work per week, the method of securing work and the discharge of employees (through foremen, who must belong to the union), the employment of substitutes, type standards in the fixation of piece scales, the use of sublists (lists of authorized substitute workers), and the interchange between newspapers, not owned by the same company, of matter previously used either in the form of type, matrices, or photo-engraved plates. Of the receipts from regular dues, five cents is apportioned to the general fund, five cents to the special defense fund, seven and one-half cents to the defense fund, seven and one-half

cents to the burial fund, fifteen cents to the endowment fund of the Union Printers' Home, at Colorado Springs, Colo. In addition to the per capita tax, every member pays five cents per month as a subscription to the official paper, *The Typographical Journal*, published monthly at Indianapolis.

TYPOGRAPHY. See PRINTING.

TYR, *tir* (Icel. *Týr*, AS. *Tiu*, OHG. *Zio*; connected with Lat. *Jupiter*, Gk. *Zeús*, *Zeus*, the chief god, Skt. *dyāus*, sky). The old Norse name of a Teutonic deity. It is possible that in the early common Germanic system Tyr was the foremost god, whose place was later taken by Odin. In the Eddas he is represented as the son of Odin, the god of war and fame. When the Æsir (q.v.) persuaded the wolf Fenrir (q.v.) to allow himself to be bound with the cord Gleipnir, Tyr put his right hand in the wolf's mouth, as a pledge that he would be loosened, and when the gods refused to release Fenrir the wolf bit the hand off at the wrist. At the twilight of the gods he will meet his death at the same time with his enemy the monster dog Garm. See RAGNARÖK; SCANDINAVIAN AND TEUTONIC MYTHOLOGY.

TYRANNOSAURUS. An extinct tyrant lizard which, when erect, stood 18 feet high. It was one of the most formidable of all the huge dinosaurs whose remains are found in the Cretaceous rocks of the western United States. Consult F. A. Lucas, *Animals of the Past* (New York, 1913).

TYRANT (Lat. *tyrannus*, from Gk. *τύραννος*, master, sovereign). A name given in modern times to an arbitrary and oppressive ruler, but by the ancient Greeks applied not necessarily to one that exercised power badly, but merely to one that obtained it illegally, or to one who held sovereignty originally established by usurpation. While tyrants appear sporadically at all periods in Greek history, they were especially numerous during the seventh and sixth centuries B.C., when it was not difficult for an ambitious and unscrupulous man, often a noble, to appear as a leader of the populace and by its aid secure power. Often a violent seizure of the power was welcomed as affording relief from present evils. In other cases the tyrant of the nobles was a lawgiver to the demos. These early tyrants seem usually to have ruled generously towards the poorer classes, but towards other nobles they were naturally suspicious and frequently stern and cruel. While there are cases in which ancient testimony declares the tyrant a true tyrant in the modern sense, the greater number of these men seem to have aimed at a just rule, and the glory and prosperity of their states; they were frequently the patrons of literature and the fine arts. This is especially noticeable in the Sicilian tyrants of the fifth century B.C. After the Persian wars, the development of democracy and the rise of Athens led to the passing away of this form of government, to revive with the general weakening of the Greek states. This later period of tyranny, which begins in the fourth century B.C., is not marked by so wide an extension of the evil, but, on the other hand, a few of the possessors of the power are men of extraordinary ability, who, having proved capable of restoring or rescuing an enfeebled state, have seized or been given the supreme control. Such were Dionysius I of Syracuse and Jason of Pheræ.

In general this second series of tyrants were more cruel and arbitrary than the earlier generation. The Thirty Tyrants (q.v.) of Athens were only an oligarchical board established in the interest of Sparta in 404 B.C., and owed the name "Tyrants" to later writers, their contemporaries referring to them as "The Thirty." Consult: Plass, *Die Tyrannis bei den Griechen* (Bremen, 1852); Zeller, *Ueber den Begriff der Tyrannis bei den Griechen* (Berlin, 1887); Schömann-Lipsius, *Griechische Alterthümer* (4th ed., ib., 1897).

TYRANT FLYCATCHER. See FLY-CATCHER.

TYRANTS, THE THIRTY. See THIRTY TYRANTS, THE.

TYRCONNEL, tēr-kōn'el, RICHARD TALBOT, EARL and titular DUKE OF (1630-91). An Irish Jacobite. He was the youngest son of Sir William Talbot, of County Kildare, Ireland, a prominent Roman Catholic politician during the reign of James I. He fought against Cromwell at Drogheda and after the death of Charles I lived in Spain and Flanders. In his youth he was notorious as a sharper and bully and under the Protectorate he was recommended as a man fit to assassinate Cromwell. Soon after the Restoration he endeavored to obtain the favor of the royal family by blackening the reputation of Anne Hyde, so as to furnish the Duke of York with a pretext for breaking his promise of marriage to her. Though unable to injure her reputation, he succeeded in gaining the favor of the Duke, and contrived to make himself welcome at the palace both as a votary of its pleasures and as a counselor in affairs of state. Immediately on the accession of James II he was made Earl of Tyrconnel, and put in command of the troops in Ireland. He now aimed, by means of the Irish army, to make the King independent of Parliament. To this end he discharged Protestant soldiers, and favored Roman Catholics in every possible way, admitting them not only to the army, but to offices and corporations. This service he performed so well that in 1687 the King made him Lord Deputy of Ireland. His arrival in that country spread terror and dismay through the English Protestant population, who had already suffered under his military rule. Finding themselves without protection and their property a prey to marauders, many of them left the country, commerce declined, and economic conditions became wretched. But this state of affairs did not last long. On the arrival of James II in Ireland in 1689, after his flight from England, he created the Earl Duke of Tyrconnel. After the fatal battle of the Boyne (1690), in which the Duke held high command, he retired to France. In 1691 he returned to Ireland, to further the cause of James. Notwithstanding the defeat of Aughrim (July 12, 1691), and the capitulation of Galway, Tyrconnel made preparations for the defense of Limerick, binding himself and his countrymen by oath not to surrender until they received permission from James, then at St. Germain. At the same time, however, he dispatched a letter in which he stated his conviction that all was lost. On August 11, before an answer could arrive, he was stricken with apoplexy, and died on the 14th.

TYRE, tīr (Lat. *Tyrus*, from Gk. *Τυρός*, Aramic *Tur*, from Phœnician *Šūr*, rock). The most important city of ancient Phœnicia, on the

Mediterranean coast about 50 miles south of Beirut (Map: Turkey in Asia, C 4). Its name comes from the double rock just off the coast, the site of the earliest settlement. This portion of the city is connected with the mainland by a causeway which dates from the days of Alexander the Great; before the Greek period, however, the older Tyre was an island divided by a natural canal. It has now been definitely ascertained that the old sanctuary to Melkart, the Baal or chief deity of Tyre, stood on the southwestern part of the little island, and, this being determined, priority of the island settlement over the adjoining coast is also determined. The city grew until it included as a suburb the adjoining coast land, and after the union of island and coast the entire place was known as the city of Tyre. From a strategic point, the situation of Tyre was favorable, while its admirable ports predestined it for its future commercial rôle. Those ports were chiefly two, the Sidonian port and the Egyptian harbor. Whether Tyre or Sidon is the oldest settlement of Phœnicia is not easily decided. The evidence is in favor of the latter, though the view formerly held, which made Tyre an offshoot of Sidon, must be abandoned in the light of recent researches. Herodotus records a tradition which traced the settlement of Tyre back to the twenty-eighth century B.C. The date may be too early, though when Egypt began her campaigns for the possession of western Asia under Thothmes I (c.1510 B.C.) Tyre was already flourishing and important. A new period of prosperity began for Tyre with the decline of Egyptian control (c.1400 B.C.), and though we know little of the history of the place for the next three centuries, the important position it occupied when Tiglath-pileser I or Assyria (c.1140-1105 B.C.) opened his successful series of campaigns to the West justifies the conclusion that in the interval Tyre more than maintained her supremacy over Sidon. It was a period of commercial extension, followed by a decline due to internal disturbances. It was not until c.870 B.C. that, so far as present knowledge goes, an Assyrian king, Asurnazirpal III, included Tyre and Sidon in his campaigns and obtained tribute from both, as well as from Byblos and Arvad. Among the kings of this period known to us from a list of Menander preserved by Josephus is Hiram from whom Solomon obtained material and workmen for his building operations. (See HIRAM; SOLOMON.) After the days of Asurnazirpal III, the compact between Tyre and Assyria remained uninterrupted, except for short intervals. To save her commerce and her position of supremacy, Tyre preferred to pay tribute rather than risk an encounter at arms with Assyria. In the days of Sennacherib (705-681 B.C.), however, Tyre paid for a manifestation of independence by an encounter with the Assyrian monarch, which ended in a momentary defeat for the Assyrians; but Tyre was cut off from communication with the coast, and after enduring a siege of five years, according to Menander, was obliged to submit (c.700 B.C.). Tyre recovered and entered in a combination with Egypt to resist the advance of Esarhaddon, the successor of Sennacherib, who had to content himself with receiving the homage of King Baal of Tyre without actually capturing the city; but Asurbanipal, his successor, may have succeeded towards the

end of his reign (668-625 B.C.) in forcing the city to surrender. Tyre became an Assyrian vassal, but her commercial position was unaffected, and the fall of Assyria (c.606 B.C.) enabled her once more to assert her independence. Nebuchadnezzar II besieged the city for 13 years; at the end of that time (572 B.C.) he was forced to leave and seek compensation for his vain labors in Egypt. But Tyre was no doubt exhausted by the long siege, and her old rival Sidon profited by the loss of trade which followed, to take up the superior position in the commercial world. The last native ruler of Tyre was Ittobaal. Tyre fell into the hands of the Persians in the reign of Cambyses (c.527 B.C.). It still flourished in the Achæmenian period, sent large fleets as their contingents to the Greek wars, and formed with Sidon and Arvad a federal state having its capital at Tripolis.

It was taken by Alexander in 332 B.C. after a seven months' siege, and by Antigonos 17 years later, after a siege of 14 months. During the Roman period it was an important city with a famous university and a dominant Hellenistic type of civilization. During the early centuries of modern occupation it was again a centre of commerce and industry. It was captured by the Crusaders under Baldwin II in 1124 and remained in the hands of the Christians till 1291, when it was taken and destroyed by Malik al Ashraf, ruler of Egypt and Syria. It has never recovered its old importance. The present town (Ar. *Ṣūr*) has about 6500 inhabitants. Consult: Prutz, *Aus Phönizien* (Leipzig, 1876); Krall, "Studien zur Geschichte des alten Aegyptens, iii, Tyros und Sidon," in *Sitzungsberichte der kaiserlichen Akademie der Wissenschaften zu Wien*, vol. cxvi (Vienna, 1888); Jeremias, *Tyros bis zur Zeit Nebukadnezars* (Leipzig, 1891); Lucas, *Geschichte der Stadt Tyros zur Zeit der Kreuzzüge* (Berlin, 1896); Hugo Winckler, *Altorientalische Forschungen* (Leipzig, 1893-1906); Victor Bérard, *Les Phéniciens et l'Odyssée* (Paris, 1902-03); Landau, *Die Phönizier* (2d ed., Leipzig, 1903).

TYRE, APOLLONIUS OF. See APOLLONIUS OF TYRE.

TYRE, WILLIAM OF. See WILLIAM OF TYRE.

TYREE. See TIRÉE.

TYRIAN (tîr'-an) **PURPLE**. See MUREX; PURPLE SHELL.

TYRNAU, or **TIRNAU**, tēr'nou (Hung., *Nagy-Sombat*; Slav., *Trnava*). A town of Hungary, on the river Trnava, 25 miles north-east of Pressburg (Map: Austria-Hungary, E 2). It has a cathedral, dating from 1389, and a large episcopal palace. Tyrnau has manufactures of cloth, linen, vinegar, sugar, and malt products, and has a general trade, especially in wine. Pop., 1900, 13,281; 1910, 14,759, mostly Slovaks and Magyars.

TYROL, tē-rōl'. A crownland of Austria. See TIROL.

TYROLIENNE, tēr'ōlyēn' (Fr., Tyrolease). A Tyrolease dance, or dance song. It is best heard in the Zillerthal, in the Tyrolease Alps. A characteristic feature is the Jodler. See JODEL.

TYRONE, tî-rōn' (Ir., *Tir-owen*, Owen's country). An inland county of Ulster, Ireland (Map: Ireland, D 2). Area, 1260 square miles. The principal rivers are the Blackwater, the Foyle, and the Mourne. The northwestern mountains rise in Slieve Sawel to a height of

2236 feet. Between Dungannon and Stewartstown there is a small but productive coal field. The soil of the plain is fertile; the hilly districts are sandy or gravelly, and devoted to pasturage. There are manufactures of linens and coarse woollens and earthenware. Pop., 1851, 255,700; 1901, 150,567; 1911, 142,665. The capital is Omagh.

TYRONE. A borough in Blair Co., Pa., 15 miles northeast of Altoona, on the Little Juniata River, and on the Pennsylvania Railroad (Map: Pennsylvania, E 6). It has considerable commercial importance, being an outlet for the Clearfield coal fields, and is noted especially for the manufacture of various paper products. There are also planing mills, and chemical and candy factories. Tyrone is an important railroad junction and has large repair shops. The Birmingham Female Seminary is 3 miles distant. Pop., 1900, 5847; 1910, 7176.

TYRONE, HUGH O'NEILL, second EARL OF (1540-1616). An Irish soldier and revolutionist. He was the grandson of the first Earl, his father, who was illegitimate, being Baron of Dungannon. His elder brother was murdered in 1562, and Hugh became Baron of Dungannon, for precaution being sent to England. In 1568 he returned to Ireland, and for some years had difficulty in maintaining his position against his kinsmen. In 1580 he commanded a troop of horse in Munster against the rebel Earl of Desmond, and in 1583 was commander of the northern marches. In 1585 he was allowed to style himself Earl of Tyrone, and, strengthening his power in 1587, visited England to petition for a restitution of all lands granted to his putative grandfather by Henry VIII. He was unsuccessful, and, resenting the visit of commissioners sent to arbitrate his differences with his rival, Turlough Luineach, he attacked the latter, but was defeated. He was placed under restraint and afterwards pardoned, but he entered on intrigues to separate Ireland from England, offered the crown of Ireland to Philip II of Spain, and after a comparatively successful campaign, in which he defeated Sir John Norris, he killed his brother-in-law, Sir H. Bagnal, and effected a truce with the Earl of Essex. In 1601 he was worsted by Lord Mountjoy, surrendering to him early in 1603. He was soon after pardoned. In 1607, again suspected, he fled to Brussels, afterwards proceeding to Rome, where he lived on a small pension allowed him by the Pope and the Spanish King. Consult John Mitchel, *The Life and Times of Aodh O'Neill* (New York, 1868).

TYROSINASE. See ENZYME; OXIDASE.

TYROSINE, tîr'ō-sin or -sēn. See LIVER.

TYROTOXICON (Neo-Lat., from Gk. *τύρος*, *tyros*, cheese + *τοξικόν*, *toxikon*, poison). An alkaloid isolated from poisonous cheese, by Victor C. Vaughan, of Michigan, in 1885, and named by him in ignorance of the fact that Kuhn, of Leipzig, had given this name in 1824 to "a poisonous principle formed in cheese by putrefaction." The principle has been found in ice cream and cream puffs, as well as in milk.

The symptoms of tyrototoxic poisoning are vomiting, diarrhea, pain over the stomach, coated tongue, feeble and irregular pulse, pale and cyanosed face. In some cases the body is covered with spots. In others there is marked dryness and constriction of the throat. In all there is marked nerve exhaustion. The treat-

ment of tyrotoxic poisoning consists in emptying and flushing the digestive tract and supporting the heart.

TYRRELL, GEORGE (1861-1909). A British Catholic theologian. He was born in Dublin and studied there at Trinity College in 1878, but in the following year became a member of the Roman Catholic church. Entering the Jesuit order in 1880, he took the required training and was ordained priest in 1891, and afterward was appointed an instructor in philosophy at St. Mary's Hall, Stonyhurst, England. In 1899, three years after his removal to London, his sympathy with some tendencies of modern religious thought became evident and prevented a complete acceptance of the principles of the order. Moreover, his later writings disclosed divergences from conservative Catholic theology, while his mysticism emphasized the religious life as transcending any doctrinal embodiment of it. The Jesuit authorities disapproved of him, and finally one of his privately printed letters on religious subjects, which had been translated and published in a Milan periodical, occasioned his expulsion from the order in February, 1906. About a year and a half later, his criticism in the London *Times* of the Pope's encyclical against modernism was the cause of his minor excommunication, with reserved case at Rome. Nevertheless, although deprived of his standing as a priest and a Jesuit, Tyrrell continued to maintain his liberal attitude and his distinction between the experiences of personal religion and their theological interpretation. In 1908 Cardinal Mercier of Belgium attacked him in his Lenten pastoral as the protagonist of modernism, and Tyrrell replied the same year in a volume entitled *Medievalism*. Since he never retracted and his reserved case was not decided, he died virtually outside the pale of the Roman Catholic church. His other publications include: *Nova et Vetera: Informal Meditations* (1897; 3d ed., 1900); *Hard Sayings* (1898); *External Religion: Its Use and Abuse* (1899); *Oil and Wine* (1902; new ed., 1907); *Lex Orandi* (1903); *Lex Credendi* (1906); *Through Scylla and Charybdis* (1907), being the narrative of his religious development; and *Christianity at the Cross-Roads* (1909). Consult Hakluyt Egerton, *Father Tyrrell's Modernism* (London, 1909), and M. D. Petre, *Autobiography and Life of George Tyrrell* (2 vols., ib., 1912).

TYRRELL, JAMES WILLIAMS (1863-). A Canadian civil engineer, born at Weston, Ont. He graduated in civil engineering at Toronto University in 1889, but before this date had had varied experience. In 1893 he went with his brother, Joseph Burr Tyrrell (q.v.), as topographer and interpreter on an expedition from Lake Athabasca through the Barren Lands to Chesterfield Inlet; and in 1900, at the request of the Department of the Interior, Ottawa, he took charge of an exploratory survey of the region between Great Slave Lake and Hudson Bay, traveling nearly 5000 miles by canoe and dog sled. He was elected president of the Ontario Land Surveyors' Association in 1905. He published: *Across the Subarctic of Canada* (1897; 3d ed., 1908); *Report on the Great Slave Lake-Hudson Bay Expedition of 1900*.

TYRRELL, JOSEPH BURR (1858-). A Canadian geologist and mining engineer. He was born at Weston, Ont., and graduated at Toronto University in 1880. Appointed (1881)

an explorer on the Canadian geological survey staff, he took part, between 1883 and 1892, in expeditions in Manitoba and the Northwest, and in 1893-94 made notable journeys, largely through the unexplored north and northwest country, traveling over 6000 miles. (See **TYRRELL, JAMES WILLIAMS**.) In 1898-1906 he was a mining engineer in Dawson City, next removing to Toronto. In 1896 the Royal Geographical Society awarded him the Back grant, and he was twice elected president of the Canadian Institute (1910, 1911). He wrote *David Thompson, Explorer* (1910), and edited Samuel Hearne's *A Journey from Prince of Wales's Fort in Hudson Bay to the Northern Ocean, in the Years 1769-72* (1911).

TYRRELL, ROBERT YELVERTON (1844-1914). An Irish classical scholar, born at Ballingarry, County Tipperary, and educated at Trinity College, Dublin. He was appointed fellow of Trinity College in 1868, was made professor of Latin in 1871, and served as regius professor of Greek (1880-98), as professor of ancient history (1900-04), and then as registrar. He was a frequent contributor to English reviews, and edited and translated many classical works. Tyrrell received honorary degrees from several of the great universities. The most important of his works are: an edition, with Purser, of the *Correspondence of Cicero* (7 vols., 1879-1900); *Bacchæ* of Euripides (2d ed., 1897); *Troades* (2d ed., 1884); *Miles Gloriosus* of Plautus (2d ed., 1886); *Latin Poetry* (1893); *Sophocles* (1897); *Anthology of Latin Poetry* (1901); *Echoes of Kottabos* (1906), with Sir E. Sullivan; *Essays on Greek Literature* (1909).

TYRRHENIAN SEA (Lat. *Tyrrhenum mare*). That part of the Mediterranean Sea which is inclosed between the islands of Corsica and Sardinia on the west, Sicily on the south, and the Italian peninsula on the east (Map: Italy, C. D. 4).

TYRTÆUS (Lat., from Gk. *Τυρταῖος*, *Túrtaios*, *Tyrtaios*) (fl. c.630 B.C.). A Greek lyric poet, famous for his political elegies and marching songs. According to Attic tradition, he was a lame schoolmaster of Aphidnae, in Attica, of low birth, whom the Athenians, ignorant of his lyric power and jealous of the Lacedæmonians, sent to Sparta when the Lacedæmonians, at the advice of the Delphic Apollo, asked them for assistance against the Messenians. The tradition, however, is only the invention of a late time. Tyrtaeus was no doubt a Spartan, or an Ionian who had moved to Sparta. By his poems he aroused the Spartans and led them to victory over their foes. The fragments of his work are published by Bergk, *Poetæ Lyrici Græci*, vol. ii (5th ed., Leipzig, 1914). See **EMBATERION**.

TYRWHITT, tîr'it, RICHARD ST. JOHN (1827-95). An English writer on art. He graduated at Christ Church, Oxford, in 1849, and was a tutor from 1852 to 1856. Ordained in the English church, he was vicar of St. Mary Magdalen at Oxford from 1858 to 1872. Tyrwhitt had an uncommon artistic insight and exhibited several water colors that showed rare promise. But a lack of technical training led him to forego original painting for the interpretation of the work of others. Among his works are: *Concerning Clerical Powers and Duties* (1861); *Christian Art and Symbolism, with Hints on the Study of Landscape* (1872); *The Art Teaching of the Primitive Church* (1874); *Greek*

and Gothic: Progress and Decay in the Three Arts of Architecture, Sculpture, and Painting (1881); *An Amateur Art Book: Lectures* (1886). He also published a novel and a volume of verse called *Free Field Lyrics* (1888).

TYRWHITT, THOMAS (1730-86). An English scholar, born in London. He was educated at Eton and at Queen's College, Oxford, where he graduated in 1750. Five years later he was elected fellow of Merton, and called to the bar at the Middle Temple; but he never practiced law. From 1756 to 1762 he was Deputy Secretary of War, and from 1762 to 1768 clerk of the House of Commons. Both of these positions he resigned, for they interfered with his studies. Tyrwhitt is now best known for his edition of Chaucer's *Canterbury Tales* (4 vols., 1775; 5th vol., 1778). He also punctured (1778 and 1782) the bubble of the Rowley forgeries. His classical scholarship is represented by sundry dissertations on, and editions of, ancient authors.

TYSON, GEORGE E. (1829-1906). An American whaler and Arctic explorer, born in New Jersey. When already a whaler of extended experience, Tyson sailed as ice master of the *Polaris* American polar expedition under Hall in 1871. When the *Polaris* was shipwrecked in Smith Sound, Tyson and 18 of the crew were left adrift on the ice pack. Assuming command of the party, by his resourcefulness and seamanship he kept the men together and maintained their morale under desperate circumstances. They were rescued by the sealer *Tigress*, April 30, 1873, off the coast of Labrador after a drift of about 1800 miles during 196 days. An account of the drift is found in Blake, *Arctic Experiences Containing Capt. George E. Tyson's Wonderful Drift on the Ice-Floe* (New York, 1874).

TYSON, JAMES (1841-). An American physician and pathologist, born in Philadelphia. At the University of Pennsylvania, where he graduated M.D. in 1863, he was professor of pathology and morbid anatomy from 1876 to 1889, dean of the medical faculty from 1888 to 1892, and professor of the practice of medicine from 1899 till his retirement in 1910, becoming well known especially through his earlier work in the cell theory and Bright's disease. He held the presidency of the Association of American Physicians (1907-08) and of the College of Physicians, Philadelphia (1907-10). Among his writings are: *The Cell Doctrine* (1870; 2d ed., 1878); *Introduction to Normal Histology* (1873); *Guide to the Practical Examination of Urine* (1875; 10th ed., 1902); *Treatise on Bright's Disease and Diabetes* (1881; 2d ed., 1904); *Manual of Physical Diagnosis* (1891; 4th ed., 1901); *The Practice of Medicine, a Textbook* (1896; 6th ed., rev. and rewritten, 1913); *Selected Addresses on Subjects Relating to Biography, Travel, etc.* (1914).

TYTLER, tit'lér, ALEXANDER FRASER (1747-1813). A Scotch historical writer, and a judge of the Court of Session in Scotland under the title of Lord Woodhouselee. He was born in Edinburgh, where he was educated. In 1770 he was called to the Scottish bar. In 1780 he became professor of history in the University of Edinburgh; in 1790, judge advocate of Scotland; and in 1802 he was raised to the bench of the Court of Session. His writings include a biography of Henry Home, Lord Kames (1807); *The Decisions of the Court of Session*

(1778); and the work by which he was best remembered, *Elements of General History* (1801).

TYTLER, PATRICK FRASER (1791-1849). A Scotch historical writer, born in Edinburgh, the fourth son of Alexander Fraser Tytler, Lord Woodhouselee. He was educated in Edinburgh and in England, and was called to the Scottish bar in 1813. Three years later he was appointed King's counsel, but devoted himself chiefly to the production of various literary and historical works, the most valuable of which is his *History of Scotland* (1828-43), beginning at the accession of Alexander III and terminating at the union of the crowns—a book of more original research than any preceding work on the same subject. His writings also include *Life of James Orlinton of Cluny, commonly called the Admirable Orlinton* (1819); *Life and Writings of Sir Thomas Craig of Riccarton* (1823); *Life of John Wicliff* (1826); *Lives of Scottish Worthies* (1831-33); *Historical View of the Progress of Discovery on the More Northern Coasts of America* (1832); *Life of Sir Walter Raleigh* (1833); *Life of King Henry VIII* (1837); and *England under the Reigns of Edward VI and Mary* (1839), with the contemporary history of Europe. In consideration of his merits as an historian, Sir Robert Peel's government conferred on him a pension of £200 a year. Consult J. W. Burgon, *Life of Patrick Fraser Tytler* (London, 1859).

TYUMEN, tyōō-mān'y'. A town in Siberia. See TIUMEN.

TZANA, tsā'nā, **TANA**, or **DEMBEA**. A lake in Abyssinia, situated between 11° 35' and 12° 16' north latitude, at a height of 5800 feet, and occupying an area of 1160 square miles (Map: Egypt, D 5). It is surrounded by volcanic mountains, receives over 30 affluents, and discharges its waters southward through the Blue Nile. It contains a number of inhabited islets.

TZAR. See CZAR.

TZE-AN (1837-81). Senior wife of Hien-fung (q.v.), Emperor of China, and known as the Empress of the Eastern Palace, to distinguish her from Tze-hsi (q.v.), the Empress of the Western Palace, familiar in history as the Great Empress Dowager. Although Tze-an was the one legal wife of Hien-fung and in rank above the Western Empress, yet she was easily dominated by the more masterful Tze-hsi, to whose plans and ambitions, while both were Empresses Dowager, she offered no obstacles. She is remembered mainly because of her association with Tze-hsi.

TZE-HSI, TZU-HI, or TZI-HI, tzā-hē (1835-1908). The most famous woman in Chinese history, known as the Great Empress Dowager, and virtually the ruler of China for almost half a century. She was born in Peking of a Manchu family named Hweicheng, and belonged to the historic Nara, or Nala clan, hence her name of Yehonala, which she bore when a child. In her sixteenth year she was selected for the Imperial harem of the Emperor Hien-fung (q.v.). She started as a *kwei-jen*, or concubine of the fifth rank. Because of her beauty and talents she was promoted to the fourth rank in 1854; in 1856 she was advanced to the third rank, and by 1858 she was second only to the first concubine Tze-an (q.v.), who became Imperial consort on the death of Hien-fung's legal wife. Practically uneducated when she entered the

palace, she applied herself diligently to a thorough course in Chinese history, calligraphy, and classics, and became known as a fine scholar of the old school. On April 27, 1856, she gave birth to a son, afterward the Emperor Tung-chih (q.v.); this greatly increased her influence. She was now known as the Empress of the Western Palace. It was her almost unerring judgment of people and events which enabled her eventually to reach absolute power. On the death of Hien-fung she frustrated a conspiracy to put her out of the way, and together with Tze-an (q.v.), the Empress of the Eastern Palace, and Prince Kung she secured the overthrow of her enemies. She was then 26 years of age.

From that time she was the real ruler of China, remaining so during the reigns of Tung-chih (1861-75) and Kwang-sü (q.v.), to whom she married her favorite niece, also called Yehonala. She had the political wisdom to select Li Hung Chang (q.v.) as her chief adviser, and later Li's protégé, Yuan Shih-kai (q.v.). These two men, together with Prince Kung and Prince Ching, helped her to direct her foreign policies. She was able to keep her country in fairly good standing among the nations of the world until the Chino-Japanese War (1894-95) revealed the weakness of China and the inability of the Chinese government to prevent territorial aggression. The result is found in the most critical period of Chinese history, from 1895 to 1902. First came the seizures, leases, and concessions of the Powers, which Tze-hsi was powerless to withstand. Then came the short-lived era of reform of the Emperor Kwang-sü in 1908, which Tze-hsi believed to be premature and therefore crushed, through her agents Jung-lu and Yuan Shih-kai. But she was not able to prevent the Boxer Rebellion, and although she at first disapproved of it, she later gave the Boxers encouragement and Imperial support. The tragic results of the Rebellion having taught Tze-hsi that the old order in China must be eradicated, from 1901 to 1908 she distinctly encouraged the modernizing of China, and also was in favor of constitutional government, which she promised should be granted in 1916. It was largely because of her determined stand that China threw off the opium curse, although Tze-hsi herself indulged occasionally. In 1908, just before her death, she designated Pu-yi (Hsuan-tung, q.v.), son of her nephew, Prince Chun (Tsai-feng, q.v.), as the next Emperor. She died Nov. 15, 1908, one day after the death of Kwang-sü.

Tze-hsi was ambitious and arbitrary, but, like Queen Elizabeth of England, was able to surround herself with good advisers and the ablest of her subjects. Remarkably patriotic, she never spared herself the grinding toil necessary to rule the Chinese world. Her character has been much maligned, especially by her enemies in south China, and as much overpraised by her admirers. She is one of the few women

who have profoundly influenced the world's history.

TZENTAI, tsén'täl. An ancient cultured nation of Mayan stock, occupying a large part of the states of Tabasco and northern Chiapas, in Mexico. Their traditional culture hero was Votan, who was said to have built the great ruins at Palenque (q.v.), in Chiapas, and their general civilization resembled that of the Maya and other cognate tribes. They still constitute an important part of the population of their ancient territory.

TZETZES, tsët'séz, JOHANNES (Lat., from Gk. Ἰωάννης Τζέτζης) (twelfth century A.D.). A Byzantine author and grammarian, who devoted himself to classical Greek literature. He was author of many works, both prose and verse, which have value as sources of classical information not available elsewhere. His principal writings are his poems *Iliaca*, which included the *Ante-Homerica*, *Homericæ*, and *Post-Homerica*, and dealt with the entire Trojan tradition, and are best edited by Bekker (Berlin, 1816). His *Chiliades* is a didactic poem in 12,674 verses, divided into sixty chapters, treating of mythological, literary, and historical miscellanies. This huge work was provided by its author with explanatory scholia; it was edited by Kiessling (Leipzig, 1826). Other works are: a collection of 107 letters, his scholia to Hesiod, Aristophanes, Lycophron's *Alcandra*, Oppian's *Halieutica*, and some minor works. His elder brother, Isaac Tzetzes, was probably associated with him in preparing certain commentaries, and devoted himself particularly to the study of metric. Consult: K. Krumbacher, *Geschichte der byzantinischen Literatur* (2d ed., Munich, 1897); H. Spelthahn, *Studien zu den Chiliades des Johannes Tzetzes* (ib., 1904).

TZINTZUNZÁN, chí'ch'wón-chán. A town of the State of Michoacán, Mexico, 28 miles west of Morelia, on Lake Patzcuaro. It is celebrated for its church containing a painting supposed to be an Entombment, by Titian, which is worshiped by the people.

TZONECA, tsó-nā'k'a. See TSONEKAN.

TZSCHIRNER, chér'nér, HEINRICH GOTTLIEB (1778-1828). A German Protestant theologian. He was born at Mittweida, Saxony; studied theology at Leipzig; became professor of theology at Wittenberg in 1805; at Leipzig in 1809; and prebendary of Meissen in 1818. He published *Protestantismus und Katholicismus aus dem Standpunkt der Politik betrachtet* (1822; 4th ed., 1824); *Das Reaktionssystem* (1824); and *Der Fall des Heidentums* (ed. by Niedner, 1829). Consult his *Life* by J. Goldhorn (Leipzig, 1828) and K. H. Pöhlitz (ib., 1828).

U

U The twenty-first letter of the English alphabet. The Phœnician alphabet ended with *t* (q.v.) and *u* was the first of the letters developed in Greek to supply the deficiency of the Phœnician. (For the early history of this letter, see ALPHABET.) Originally U was the uncial and cursive form, and V the capital form. The two were differentiated about the fifteenth century A.D., when V was limited to representing the consonant sound. Before the fifteenth century small *v* and *u* were used interchangeably. In English *u* represents a variety of sounds besides its original value, which is that of a rounded back vowel, the *u* in *rude*. It stands also for the sound *yoo*, as *educate*, *mule*, *value*. It is pronounced like *oo* in *full*, *pull*, *push*; *û* in *Turk*, *turnip*, *urge*; *ũ* (unrounded) in *tub*, *up*, *muff*. A *u* is always written after *q* (q.v.). In this case it has the consonantal value of *w*, which it has also often after other consonants, especially *g* and *s*, as in *quick*, *quartz*, *quote*; *language*, *anguish*; *suave*, *dissuade*. It is silent in *guard*, *tongue*, *build*, etc.

The sources of *u* are as follows: AS. *û*, as *nut*, from *hnutu*; AS. *û*, as *us* from *ûs*, but from *bûtan*, *up* from *ûp*; AS. *ô*, as *must* from *môste*.

In chemistry U stands for *uranium*. See PHONETICS. Consult: Philippe Berger, *Histoire de l'écriture dans l'antiquité* (2d ed., Paris, 1892); W. Rippmann, *Elements of Phonetics* (London, 1910); Maurice Prou, *Manuel de paléographie latine et française* (3d ed., Paris, 1910); Henry Sweet, *The Sounds of English* (Oxford, 1908); Sir E. M. Thompson, *Introduction to Greek and Latin Paleography* (ib., 1912).

UAKARI, wâ-kâ'rê. See OUAHARI.

UARAYCU, wâ-rî'kôô. A peculiar tribe on the lower Jurua and Jutay rivers, and the adjacent portion of the Amazon, western Brazil. They whip their youths, and suspend maidens over a smoking fire, as tests of fortitude. Girls are betrothed in childhood, and the young man must hunt game for his bride long before he is permitted to marry her. They burn their dead and bury the ashes in their huts.

UARDA, ôô-âr'dâ. The second of the Egyptian historical novels by Georg Ebers (1877). The action takes place in Egypt during the reign of Rameses II.

UAUPÉ, wâ'ôô-pâ'. An extensive group of tribes, probably remotely of Arawakan stock (q.v.), residing on the Uaupés River, a head stream of the Río Negro, in southeastern Colombia. They cultivate corn, tobacco, manioc,

cane, and bananas, are experts with the bow, lance, and blowgun, and are great fishermen. They live in large communal houses, sometimes nearly 100 feet square, with a roof nearly 40 feet high supported by columns hewn from tree trunks. They make pottery and baskets and use canoes hollowed out from logs. The men wear the G-string, feather headdresses, and amulets. The women go naked. Those of the same clan are not allowed to intermarry. Each communal household has its hereditary chief. In physique they are tall, stout, and well made. They are reputed to be very industrious.

UAUPÉS, wâ'ôô-pâs'. A large tributary of the Río Negro, considered by some geographers as the true head stream of that river (Map: Brazil, C 3). It rises in the Eastern Cordillera of the Colombian Andes, descends in falls and rapids, and flows southeastward to its confluence with the main stream in northwest Brazil. It is over 700 miles long, and navigable in its lower course.

UBALDINI, ôô'bâl-dé'nê, PETRUCCIO (?1524-?1600). An Italian illuminator and scholar of Tuscan birth. He went to England in 1545, and in the reign of Edward VI fought in the Scottish wars. At this period of his life he wrote *Relatione delle cose del regno d'Inghilterra* (1551), wherein he records his experiences of English manners and institutions. In 1580 he visited Ireland and compiled an account of the unsuccessful Spanish-Italian invasion of Kerry. His *Vita di Karlo Magno Imperatore* (1581) was the first Italian book printed in England.

UBANGI, û-bân'gi. A river of Central Africa, the largest northern tributary of the Congo (Map: Congo, C 2). It is known also as the Mobangi (near its mouth), the Dua (19° to 20° E.), the Koyu (21° to 22° E.), and the Makua and Welle (in its upper course). The river rises in the extreme northeastern corner of Belgian Congo, not far from the Nile, and flows westward, then southward just above the Zongo rapids, and finally joins the Congo near the equator after a course of about 1500 miles. From its mouth to its confluence with the Mbomu at Yakoma, the Ubangi forms the boundary between French Equatorial Africa and the Belgian Congo. That part of the river known as the Welle was first discovered by Schweinfurth in 1870; some 10 years later Junker explored the Makua; in 1884 Hanssens discovered the mouth of the Mobangi; in 1885-86 Grenfell went up as far as the Zongo rapids, and within half a dozen years the several parts of the river already discovered were identified

as the Ubangi. In great part the river flows through a populous country. Ubangi is also the name of a district in the northwestern part of Belgian Congo.

UBASTET, ū-bās'tēt. An Egyptian goddess, called also Pasht or Pakht and, from the Greek form of the name of the city where she was especially worshiped, Bubastis or Bast. She was the wife of Ptah (see MEMPHIS), and was identified by the Greeks with Artemis (see DIANA). Her son was Tum, the solar deity of the western horizon. Beside her main seat of worship at Bubastis (q.v.) she was honored at Thebes (q.v.) and together with Ptah, at Memphis. Ubastet is usually represented as a woman with a cat's head; in earlier monuments she has the head of a lion. Her annual festival, held at Bubastis, was characterized by revelry with phallic accompaniments implying a fertility concept in the nature of the goddess. Her cult does not appear to have been ancient, but from the reign of Rameses III (q.v.), in the thirteenth century B.C., it became one of the most important in Egypt. See BUBASTIS, and illustration of *Pakht* in Plate of EGYPTIAN DEITIES in the article EGYPT.

ÚBEDA, ū-bā-dā. A Spanish town of the Province of Jaén, in Andalusia, in the midst of the fertile Loma de Ubeda. It is 74 miles east of Cordova (Map: Spain, D 3). The country abounds in vineyards, olive plantations, and pasturages devoted especially to the rearing of horses. The town contains a castle with more than 20 towers, the sixteenth-century Church of San Salvador, and the Gothic San Pablo and Corinthian San Nicolás of lesser note, together with the Palacio de las Cadenas (in which are the municipal offices), and the edifice of the Colegio de Escolapios. The streets are broad and well paved and with the plazas well kept. The chief manufactures are pottery, leather, soap, and woolens. An important fair is held annually. Pop., 1900, 19,395; 1910, 22,341.

UBERTI, ū-bēr'tē, FAZIO DEGLI (born not later than 1310, died not earlier than 1368). An Italian poet, born in Pisa. A Ghibelline in politics, he lived most of his life as an exile at the courts of the Visconti (Milan) and the Scaligeri (Verona). His most ambitious work, the *Dittamondo* (i.e., dicta mundi, or things worthy of note in the world), a didactic poem in terza rima (q.v.), is noteworthy chiefly because in its methods it imitates the *Divina Commedia*. Like Dante, converted to righteousness in the middle of the path of life, Fazio feigns himself guided on a fantastic journey by the ancient geographer Solinus, from whose work and that of Pliny he borrows largely. He traverses nearly all the known world save Asia, narrating fables, traditions, legends, and various curiosities of Mediaeval erudition. Save for a description of Rome the work is artistically barren. Some of his political satires, however, are spirited, and his love lyrics, with their reminiscences of the stil nuovo and even the Sicilian school, and with their yielding to Petrarchian influence, possess besides liveliness of fancy and some elegance of style. Consult: *Dittamondo* (Milan, 1826); R. Renier, *Le liriche edite e inedite di F. d. U.* (Florence, 1883); Pellizzari, *Il Dittamondo e la D. Commedia* (Pisa, 1905); Whitmore, "Fazio degli Uberti as a Lyric Poet," in *Romanic Review* (New York, 1914).

U'BIQUIST (from Lat. *ubique*, everywhere).

A plant which grows in practically all habitats. The common dandelion, which grows naturally in light or shaded, moist or dry conditions, may be regarded as a typical example. The term cosmopolite refers to existence in all climates rather than all habitats.

UBIQUITY (from Lat. *ubique*, everywhere, from *ubi*, where). A term applied in theology to the doctrine that the Lord's body, in consequence of its personal union with the divine, by a "communication of properties," is everywhere present. This use of the word has its origin in the teachings of Luther, who, to defend the real presence of the entire Christ in the elements of the Lord's Supper, taught that Christ's body could be everywhere, although he called this presence "illocal." Consult literature under LUTHER.

UCAYALI, ū'ki-ā'lē. A large river of Peru (Map: Peru, C 5), one of the main headstreams of the Amazon. From length and volume it should be considered as the true upper course of that river. It is formed by the junction of the Apurimac (q.v.), or Tambo, and the Quilabamba at the eastern base of the Andes between the departments of Junín and Cuzco, and flows northward in a winding course till it joins the Marañón in the northeastern part of Peru to form the Amazon. The length of the Ucayali proper is about 1000 miles, and with the Apurimac the length is nearly 1500 miles. Some of their sources are near Lake Titicaca, while that of the Mantaro, a tributary of the Apurimac, is in Lake Chinchaycocha or Junín (q.v.) within 100 miles of Lima, near the Pacific coast, and over 13,000 feet above the sea. So rapid is their flow that at their confluence the Ucayali proper is less than 1000 feet above sea level. Its later course through the densely forested montaña is sluggish, falling only 500 feet in nearly 1000 miles. Its banks are here very low, and it divides repeatedly into side channels, while large adjacent areas are periodically submerged. The Ucayali is navigable for large vessels, maintaining a depth of 40 to 70 feet for over 600 miles. Steamers can also ascend the Pachitea, the principal tributary below the confluence of the headstreams, over 200 miles to a point about 300 miles from Lima and 3600 miles from the mouth of the Amazon. The Ucayali thus affords an easy means of communication between the Atlantic Ocean and the heart of Peru.

UCCELLO, ūt-chē'lō, PAOLO, properly PAOLO DI DONO (1397-1475). A Florentine painter of the early Renaissance. The name Uccello was derived from his fondness for birds, which formed a part of his menagerie. It is not known with whom he studied painting, but he was perhaps influenced by Masaccio and certainly by Donatello. A pioneer of the so-called Florentine Realists, he was especially known for experiments in linear perspective and foreshortening. Wherever possible, his paintings are paradigms of perspective, and are often scientific rather than artistic productions. As they lack atmosphere, the figures seem immobile and clumsy. He excelled especially in portraiture: as in the fine equestrian portrait of the condottiere, Sir John Hawkwood, a fresco in grays in Florence Cathedral, and those of Giotto, Brunelleschi, Donatello, Manetti, and himself in the Louvre. In the cloisters of Santa Maria Novella he painted an interesting series of five frescoes of scenes from Genesis. His

well known "Battle of San Romano," an early production, survives in the Uffizi, with others of like title in the Louvre and the National Gallery, London; and a quaint "St. George and the Dragon" is in private possession in Paris and Vienna. Other interesting works are a late "Hunting Scene at Night" (Oxford), the "Story of the Jew and the Host" at Urbino; and, according to Berenson, "A Man and Woman of the Portinari Family" in the Metropolitan Museum, New York. He exercised a determinative influence on the entire realist group, and on Piero della Francesca. Uccello's marked feeling for decorative design strongly influenced the decorative arts of his day. The four windows in the drum of Florence Cathedral are after his designs. Consult Giorgio Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects*, vol. i, Eng. trans. by Blashfield and Hopkins (New York, 1896), and Bernhard Berenson, *Florentine Painters of the Renaissance* (3d ed., ib., 1909).

UCHARD, ū'shär', MARIO (1824-93). A French playwright and novelist, born in Paris. After following for some time the business of a stockbroker, he married in 1853 Madeline Brohan (q.v.) of the Théâtre Français, where he produced the drama *La Piammina* (1857), which was very successful. His other plays attracted much less attention, but his novels won much favor. They include: *Raymond* (1861); *Le mariage de Gertrude* (1862); *La comtesse Diane* (1864); *Une dernière passion* (1866); *Mon oncle Barbasson* (1876); *Inès Parker* (1880); *Antoinette ma cousine* (1891); and others.

UCHATIUS, ū-kä'tsi-us, FRANZ, BARON (1811-81). An Austrian general and inventor, born at Theresienfeld. Entering the Second Regiment of artillery in 1829, he became commandant of the ordnance works in the arsenal at Vienna in 1871, was made a major general in 1874, and lieutenant field marshal in 1879. He introduced an improved process of manufacturing steel in 1856, constructed several ballistic apparatus, especially one for measuring the pressure of gas in gun barrels, invented the so-called steel bronze (Uchatius metal), which was used for the equipment of the Austro-Hungarian field artillery, and in 1875 constructed the ring grenades, adopted since then by nearly all artilleries. Consult Lenz, *Lebensbild des Generals Uchatius* (Vienna, 1904).

UCHEE, ū'chē, or **YUCHI**, yōō'chē. An interesting tribe, constituting a distinct linguistic stock, formerly centring on the middle Savannah River, in Georgia and South Carolina, but afterwards incorporated with the Creek confederacy. Very little is known of them, but evidence tends to substantiate their own claim that they were the autochthones of eastern Georgia and the adjacent region, antedating the Muskogean tribes (see MUSKOGEAN STOCK) by many years. They call themselves children of the sun, which, according to their myth, was their mother, and was worshiped with elaborate ceremonies. In 1739 Governor Oglethorpe concluded a treaty with the Uchee at their principal town, then on the Savannah River about 30 miles above Savannah. Before the end of the century they had removed to the Creek country, where in 1799 they had four towns with about 250 warriors, or, perhaps, 800 souls. Their main town was on the western (Alabama) side of the Chattahoochee, a few miles below the present Columbus. They

participated in the treaties and wars of their Creek allies, and removed with them in 1835 to the Indian Territory. They now number but 38. Consult F. G. Speck, in *University of Pennsylvania, Anthropological Publications*, vol. i (Philadelphia, 1909).

UDAIPUR, ū'di-poor', or **ODEYPORE**, called also **MEWAR**, or **MEYWAR**. A native state of India, under British protection, in Rajputana (Map: India, B 4). Area, 12,756 square miles. Pop., 1901, 1,021,664; 1911, 1,293,776. The capital, Udaipur, situated 120 miles southeast of Jodhpore at an altitude of 2064 feet, had 47,587 inhabitants in 1911. Here is an imposing royal palace of marble and granite. Just south of the city is the fortified hill Eklingarh. The roads leading to the city are guarded by a series of fortresses, but these have fallen into a state of decay.

UDAL. See **ODAL**.

UDALL, ū'dal or **UVEDALE**, NICHOLAS (1505-56). An English schoolmaster and playwright. He was born in Hampshire. In 1524 he was graduated from Corpus Christi College, Oxford, and elected a fellow. He took an early and active part in the Reformation, but he trimmed his sails in the reign of Mary. From 1534 to 1541 he was head master of Eton, and from 1554 to 1556 head master of Westminster School. The fame of his various translations, pamphlets, and Latin and English verse has been eclipsed by his *Ralph Roister Doister*, an English comedy on the Roman model. It seems to have been composed for the boys at Eton before 1551, though, so far as is known, it was not published until 1566. It is the earliest English comedy now extant. Consult the reprint by E. A. Arber (London, 1869), and A. W. Ward, *English Dramatic Literature*, vol. i (rev. ed., ib., 1899). See **GAMMER GUTTON'S NEEDLE**.

UDDER, INFLAMMATION OF THE. See **MAMMITIS**.

UDDEVALLA, ūd'de-väl'lā. A port of Sweden, situated at the head of the Byfjord, 48 miles north of Göteborg (Map: Sweden, E 7). It has a school of navigation, and manufactures cotton goods and furniture. There are also sugar refineries, wood-pulp mills, and granite quarries. Pop., 1901, 9442; 1910, 12,583.

UDINE, ūd'dē-nā. The capital of the Province of Udine, Italy, in a fertile, highly cultivated plain on the Roja Canal, 84 miles by rail northeast of Venice (Map: Italy, D 1). It consists of an inner and an outer town separated by fortifications. The streets are crooked and narrow, but it is an agreeable city. In the centre of the town rises a hill crowned by a castle, now used as a barracks, dating from 1517. The chief square lies at the southern base of the hill. The imposing municipal palace, in the style of the Doges' Palace of Venice, contains a large marble statue of Ajax, and some excellent mural paintings. The Romanesque cathedral possesses a finely sculptured portal. Udine has a handsome theatre, a splendid archiepiscopal palace with historic memories, a school of industrial arts, and a technical institute. There is a small public garden, and the artistic house of the painter Giovanni da Udine is shown. In the Palazzo Bartolini there are a municipal museum of antiquities, paintings by Giovanni da Udine, and a library of over 88,000 volumes and 3120 manuscripts. Udine is in one of the most unique and beautiful districts in the world. The city manufactures silks, velvets, leather, metal ware, paper,

and sugar. The chief trade is in flax and hemp. Pop. (commune), 1901, 37,942; 1911, 47,617.

Udine, the ancient Utina, was an important city in the Middle Ages. In the thirteenth century it became the capital of Friuli. In 1420 it passed to Venice. Near Udine is the small but interesting town of Cividale del Friuli (q.v.), the ancient Forum Julii. Udine was the base of the Italian campaign against Austria in the great war which broke out in 1914. See WAR IN EUROPE.

UDO, ō'dō (*Aralia cordata*). A Japanese vegetable suitable for wide cultivation for its blanched, edible shoots. The plants are bushy and yield edible shoots for about nine years. They should be planted about 3 to 4 feet apart and cultivated like asparagus. The shoots are blanched by mounding with earth, or covering with closed drain tile early in the spring. The shoots may be prepared for the table in the same manner as asparagus. See ARALIA.

UEBERWEG, ū'bēr-väg, FRIEDRICH (1826-71). A German philosopher, born at Leichlingen, Prussia. He was educated at Göttingen and Berlin, and in 1862 was made professor of philosophy at Königsberg, where he remained till his death. His most important works are his *System der Logik und Geschichte der logischen Lehren* (1857; 5th ed., 1882; Eng. trans. of the 3d ed. by Lindsay, London, 1871), and his *Grundriss der Geschichte der Philosophie* (1863-66; 10th ed., rev. by M. Heinze, 1910 et seq.; Eng. trans. of the 4th ed. by Morris, New York, 1871), which is one of the most valuable histories of philosophy in moderate compass ever published, and is unrivaled in the fullness of its bibliography; *Schiller als Historiker und Philosoph* (Leipzig, 1884). Consult F. A. Lange, *Friedrich Ueberweg* (Berlin, 1871); M. Brasch, *Die Welt- und Lebensanschauung Friedrich Ueberwegs nebst einer biographisch-historischen Einleitung* (Leipzig, 1889).

UECHTRITZ, ūk'trits, FRIEDRICH VON (1800-75). A German dramatic poet and novelist, born at Görlitz, Silesia. He studied jurisprudence at Leipzig and held various judicial positions at Treves and Düsseldorf. Of several tragedies, for the most part technically weak, *Alexander and Darius* (1827), with a preface by Tieck, was produced in Dresden, Berlin, and Vienna. *Das Ehrenschrift* also met with a favorable reception. The dramatic poem *Die Babylonier in Jerusalem* (1836), while little adapted to the stage, is distinguished by brilliant diction. His best-known novels are *Der Bruder der Braut* (1860), a religious-patriotic tale, and *Eleazar* (1867), a romance of the great Judean war. He also published *Blicke in das Düsseldorf'sche Kunst- und Künstlerleben* (1839-42). Consult *Erinnerungen an Friedrich von Uechtritz und seine Zeit in Briefen von ihm und an ihn* (Leipzig, 1884), with a preface by Sybel, and W. Steitz, *F. von Uechtritz, als dramatischer Dichter* (Görlitz, 1909).

UECHTRITZ, KUNO VON (1856-1908). A German sculptor, born at Breslau. He studied at the Vienna Academy under Tilgner, to whose influence is to be attributed his fondness for the baroque and rococo styles, manifest in his early portrait busts. Subsequently he turned to polychrome work, carrying it from softer tints to thoroughly naturalistic treatment, of which an "Italian Pifferaro with his Monkey" is an example. After his removal to Berlin in 1886 he took up decorative and monumental sculpture,

earning reputation with several fountain designs, enlivened by mythological, ideal, and genre figures, and animals, and displaying a subtle sense of humor. For the Siegesallee he executed the group with the statue of Elector George William (1899), and for Breslau the Moltke Monument.

UFA, ū'fā. A government of east Russia. Area, 47,130 square miles (Map: Russia, J 4). The east portion has a mountainous surface, being traversed by offshoots of the Ural Mountains, running in densely wooded ridges parallel to the main mass. The western part has a steppelike appearance with an incline towards the Kama. This river forms the west boundary line of the government, and its navigable tributary, the Byelaya, intersects it from southeast to northwest. The climate is severe, but healthful. Ufa is a highly mineralized region containing deposits of iron, copper, coal, petroleum, sulphur, etc. Mining industries are little developed. Agriculture employs only a part of the population, as the inhabitants are stock breeders and nomadic. About one-third of the area is cultivated, producing rye, oats, and wheat. The holdings are generally large, and the use of improved machinery is increasing. An important dairy product is kumiss. The manufacturing industries are connected to a large extent with mining, and the chief iron and steel works are situated at Zlatoust (q.v.). Other manufactures are spirits, leather, soap, and candles. Pop., 1912, was 2,988,500, of whom the Russians constituted about 45 per cent of the total, the remainder consisting of Bashkirs, Tatars, and Meshtcheryaks.

UFA. The capital of the Government of Ufa, in east Russia, situated on the Byelaya, near its junction with the Ufa, 326 miles by rail east-northeast of Samara (Map: Russia, J 4). Pop., 1910, 103,485.

UFFIZI (ŭ-fet'sē), PALAZZO DEGLI. A celebrated Florentine palace, containing one of the finest collections of sculpture and painting in the world. It was erected in 1560-76, after the designs of Giorgio Vasari, for the government offices of the Grand Duchy of Tuscany. The ground story is one of the most beautiful open halls of Italy; it is roofed with barrel vaulting supported by heavy Doric pillars which extend the height of the entire façade. The top story, now containing the gallery, was originally an open loggia. In the vestibule and court are many statues of celebrated Tuscans.

The nucleus of the gallery was a part of the celebrated collections made by the Medici in the fifteenth century. Additions were acquired or inherited by many of the Medicean dukes, and the collection was bequeathed to the state by the last representative of the line in 1737. It is especially rich in antique statuary, possessing the celebrated Niobid group, the "Boy Drawing Out a Thorn," the "Apollino," the "Medicean Venus," "Satyr," "Wrestlers," "The Grinder," and "Dying Alexander." The collection of paintings is the most important in Italy, and for Italian painting the greatest in the world. It includes numerous works by artists of the early Florentine Renaissance, such as Fra Angelico, Filippino and Filippino Lippi, Domenico Ghirlandajo, and especially Sandro Botticelli, to whom a room is dedicated. The High Renaissance is well represented by Michelangelo, Fra Bartolommeo, Andrea del Sarto, Raphael, Giorgione, Titian, and Correggio, the gallery being especially rich in masterpieces of Titian and Raph-

ael. There is also a fine collection of Flemish and Dutch masters. The celebrated "Tribuna" of the Uffizi is an octagonal room containing many of the masterpieces of the collection. There is also an excellent collection of drawings, published in three series of 11 volumes and eight series of four volumes (Florence, n. d.). An interesting feature of the gallery is a unique collection of portraits of great masters by themselves. A passageway connects the Uffizi with the Pitti collection. (See PITTI PALACE.) The second story of the Uffizi contains the Biblioteca Nazionale, containing 300,000 volumes and 14,000 manuscripts. Its nucleus was the Magliabechiana collection, to which, in 1862, was added the Royal Library of the Pitti Palace. The Uffizi also houses the Florentine state archives, one of the richest collections of documents in the world. Consult C. C. Heyl, *The Art of the Uffizi Palace* (Boston, 1912), and P. G. Konody, *The Uffizi Gallery* (ib., 1912).

UGANDA (oo-gün'da) **PROTECTORATE.** A British protectorate in British East Africa, consisting of the native kingdom of Uganda and several adjacent states (Map: Congo, F 2). The protectorate covers 121,437 square miles, of which 16,377 are water.

Uganda is a remarkably diversified country, with snow peaks, elevated plains, vast forests, low swamps, and arid depressions. The variety of climate it offers is likewise exceptionally great. The Lake Rudolf region in the northeast has an average altitude of 2000 feet, is tropically hot, and is a barren and unpromising section. The Mount Elgon region and that north of the Victoria Nyanza in the southeast are much more favorable to development, owing to the ample rainfall and well-watered conditions. But the climate here is generally damp, hot, and productive of malarial fevers. This region, westward of the extinct volcano Mount Elgon—a gigantic mass 14,200 feet high, with a crater about 10 miles wide—has an average elevation of some 4000 feet, and possesses dense forests, marshes, and many good agricultural districts. The course of the Nile from the Ripon Falls (its exit from the Victoria Nyanza) through Lake Kioga to the confluence of the waters from Lake Albert is within or contiguous to this region. The western part of the protectorate, separated from the Belgian Congo by the Albert and Albert Edward lakes, the magnificent snowy Ruwenzori (q.v.), whose highest summit, Alexandra, is 16,794 feet high, and the deep-forested valley of the Semliki, forms a region rich in possibilities. Splendid plateaus and charming small lakes abound here. Cooling breezes make much of this region not only habitable, but inviting. In the Nile valley to the north, below Lake Albert, the heat is extreme, the rainfall abundant on the windward slopes of the ranges. The northern part of the protectorate is generally forbidding. The waters of the many lakes which characterize the protectorate are partly fresh and partly salt.

Except in the Rudolf district, the flora, which is in general kindred to that of West Africa, is rich and abundant, but there is no oil palm. Papyrus covers the swampy Nile valley. The lofty mountains explain the presence of the alpine vegetation in the higher parts, and of the witch-hazel and trees of kindred classes on the plateaus. Uganda has a peculiar long grass, from 10 to 15 feet high, which is used for building purposes by the natives. The fauna is allied

to that of equatorial Central Africa and the Congo basin, in conformity with the moist and forested character of the region. A list of the birds and quadrupeds would include most of those of Africa which are not strictly desert or seacoast forms. Lions and leopards are numerous, living upon antelopes and wild and tame cattle; and the rivers and lakes abound in crocodiles, feeding upon the fish, many of which are wholesome for food. There are no anthropoid apes, but many monkeys, of which the guerza is most notable. Large collections of insects and land shells have been made, but a great deal remains to be learned of the smaller life of the region.

In the eastern sections of the protectorate granite and gneiss of Archaean age are prominent; in the central regions, quartz, sandstone, and basalt are added; around Lake Rudolf lava and tuff are superimposed on the foregoing formations. Iron ore is abundant and widely distributed. Gold occurs northwest of Lake Rudolf, and graphite in Buganda and Bunyoro. The soil is very fertile, except in the Rudolf region. Among the Baganda, a remarkably efficient people, now largely Christian, not a little has been done towards improving the country by building substantial houses, making good roads, etc. The most important product commercially is cotton, the output of which has increased rapidly in recent years; the estimated area under cotton in 1913-14 was upward of 110,000 acres, and the export was 6467 tons, valued at £317,687. Other products are coffee, peanuts, cacao, ivory, and hides. Trade is chiefly in the hands of the natives and British Indians. Imports of merchandise (including goods in transit) increased from £168,911 in 1904-05 to £897,262 in 1913-14, and exports (exclusive of goods in transit) from £60,378 to £524,260. The so-called Uganda Railway is wholly within the East Africa protectorate. From Port Florence, the terminus of this railway on Victoria Nyanza, a steamer service is maintained with Entebbe, Jinja, and Port Bell in Uganda. A railway extends 8 miles from Port Bell to Kampala. The Busoga Railway extends 54 miles from Jinja around the Nile rapids to Kakindu, and thence 8 miles to Namagali, both these towns being on the Nile. Thence steamers ply to Lake Kioga, again on the Nile, and on Albert Nyanza.

The protectorate of Uganda is divided into five provinces: Rudolf, Eastern, Northern, Western, and Buganda. These provinces are subdivided into districts. Almost the entire protectorate outside of the Rudolf province is now under direct British administration; but the native chiefs are permitted, and in fact encouraged, to administer the government of their own subjects. The province of Buganda is recognized as a native kingdom. The King, whose title, "Kakaba," is hereditary, is assisted by three native ministers and by a native assembly "Lukiko." This government is well organized and efficient, and the dynasty can be traced back to about the year 1400. Similar rights and privileges are conceded to the chiefs of Bunyoro, Toro, and Ankole. For Europeans and non-natives justice is administered by British courts. The British administration is in the hands of a governor, whose headquarters are at Entebbe. The capital of the kingdom of Buganda is Mengo, about 20 miles north by east of Entebbe. The revenue and expenditure of the protectorate

were £256,559 and £290,180 in 1913-14. Deficits are covered by British grants in aid.

The population of the protectorate was estimated, March 31, 1914, at 2,909,122, including 2,904,454 natives, 3651 Asiatics, and 1017 Europeans (of whom 256 females). The Baganda, numbering about 650,000, have many churches and schools.

The natives of the protectorate may be classified as Negritos or Pygmies, Bantus (q.v.), Nilotic negroes, Hamites, and Masai (q.v.), though most of them are probably mixtures in varying degree of these different types. The Pygmies are not numerous, a few being found in that part of the Congo forest which is included within the limits of the protectorate. The Bantus, who in general are an agricultural people, make up nearly half the population. The Hamites are represented by a few tribes in the islands and on the north shore of Lake Rudolf, and by the pastoral Wahuma or Bahima, probably of Galla ancestry (see GALLAS), who more than 100 years ago conquered the Bantu agriculturists, and at present, more or less mixed with Bantu blood, form the aristocracy and ruling classes. They are purest in the western part of the protectorate, where there are also a few separate Bahima tribes. The Masai are met with in the Rudolf region, the Suk and Turkana tribes being good representatives. The Nilotic negroes occupy the Nile Province and a large part of the Central Province, reaching the Victoria Nyanza in Kavirondo. Negro tribes also extend southward along the Albert Nyanza, especially on the west side, the Semliki River, and the Albert Edward Nyanza to the extreme southwest corner of the protectorate.

The Uganda protectorate was formed initially of the once powerful native kingdom of Uganda, which has been in the British sphere of influence since 1890. The protectorate dates from 1894. The region was first visited by a European (Captain Speke) in 1862. Stanley passed through Uganda in 1875.

H. Johnston, *The Uganda Protectorate* (ib., 1902); *Handbook for East Africa, Uganda, and Zanzibar* (Mombasa, 1903); A. B. Lloyd, *Uganda to Khartoum* (New York, 1906); H. M. Stanley, *In Darkest Africa* (2 vols., ib., new ed., 1913).

UGOGO, ū-gō'gō. A district of German East Africa, about 170 miles west of that part of the coast opposite Zanzibar (Map: Congo, G 4). It is a bare, arid plateau, about 3500 feet in altitude, inhabited by the Gogo, or Wagogo, a warlike Bantu tribe.

UGOLINO DA SIENA, ū'gō-lē'nō dā syā'nā. A name appearing in the early annals of Sienese painting and once thought from its different designations to apply to four persons. It is prob-

able, however, that the Ugolino da Siena who was influenced by Duccio and Cimabue, and who died at an advanced age in 1339, was identical with Ugolino di Neri and Ugolino di Pietro, mentioned in Sienese records of 1317 and 1324. The only work attributed to him with any degree of probability is part of an altarpiece which was painted for Santa Croce at Florence, two panels of which are now in London.

UGRIANS, ū'gri-anz. A term often used to designate a subdivision (closely related to the Finns) of the Ural-Altaic stock, which included the Ostiaks, Voguls, and Magyars. See URAL ALTAIC.

UHDE, ū'de, Fritz von (1848-1911). A German historical and genre painter, born at Wolkenburg, Saxony. He began his artistic studies at the Dresden Academy in 1866, but, finding himself at variance with the spirit prevailing there, followed a military career until 1877, when again he took up painting at Munich, giving his attention especially to the old Dutch masters. In 1879 he removed to Paris, where he worked for a short time in Munkácsy's studio, but principally studied from nature and Dutch models. A result of these combined influences was the "Family Concert" (1881, Cologne Museum). The new coloristic principles which he in the meanwhile adopted are apparent in the "Arrival of the Organ Grinder" (1883), and, turning now to religious subjects, he created those remarkable and pathetic masterpieces "Suffer the Little Children to Come unto Me!" (1884, Leipzig Museum) and "Come, Lord Jesus, and Be Our Guest" (1885, National Gallery, Berlin), both scenes in a workingman's cottage. He next produced "Christ with the Disciples at Emmaus" (1885, Städel Institute, Frankfurt), "The Sermon on the Mount" (1887), the triptych of the "Nativity" (1889, Dresden Gallery), and "The Walk to Bethlehem" (1890, New Pinakothek, Munich), a bold modern conception of the subject. Uhde brought about a complete change in German art, counting among his followers most of the younger generation. His later productions include: "Noli me tangere" (1894, New Pinakothek, Munich), "The Wise Men from the East" (1896, Madgeburg Museum), "The Last Supper" (1897, Stuttgart Museum), "Richard III," "Ascension" (1898, New Pinakothek, Munich), and "Woman, Why Weepst Thou?" (1900, Vienna Museum), the altarpiece of the Lutherkirche, Ziorchan (1905), and "Going Home" (1908). Uhde is known for his attempt to bring back German art to the ancient religious ideals. Like the primitive painters he depicts with deep religious feeling, yet with powerful naturalism and highly poetic treatment of light and atmosphere, the personages of the New Testament in the lowly garb of the German working classes. He also portrays the woes of laboring people. Consult the monographs by Lücke (Leipzig, 1887), Graul (Vienna, 1893), Bierbaum (Munich, 1893), Meissner (Berlin, 1900), and for reproductions of all his works, Rosenhagen, in *Klassiker der Kunst* (Stuttgart, 1908).

UHLAND, ū'lānt, Ludwig (1787-1862). A distinguished German poet, philologist, and literary historian. Born at Tübingen, April 26, 1787, he studied jurisprudence there in 1802-08, at the same time cultivating mediæval literature, especially old German and French poetry, the study of which he pursued for eight months in Paris. On his return he began the practice

of law at Stuttgart, worked in the Ministry of Justice, and when in 1815 Württemberg was to be granted a new constitution, his lyrics in praise of liberty were enthusiastically received. As a member of the Legislature from 1819 to 1839 he sided with the opposition. In 1848 he was elected to the German National Assembly, but in 1850 retired from political life and settled at Tübingen, devoting himself exclusively to literary pursuits. From 1829 to 1833 he had held the professorship of German literature at the University of Tübingen. As a lyric poet Uhland is remarkable for truth and simplicity of sentiment and his picturesque view of nature. His ballads and romances rank among the most precious ideal treasures of the German nation. During his early life he labored to revive the ballad. None has caught the spirit of the old folk song more fully than he. Of his songs the most widely popular are "Der Wirtin Töchterlein" and "Der gute Kamerad"; of the ballads, "Das Schloss am Meer," "Das Glück von Edenhall," "Des Goldschmieds Töchterlein," "Roland Schildträger," "Der schwarze Ritter," and "Des Sängers Fluch" are in all anthologies. He was the first poet of the Swabian school who sought to combine purity of style with brevity and vigor, and to give romantic sentiment to all. Although poetically effective, his glorifications of German faith, the dramas *Ernst, Herzog von Schwaben* (1817) and *Ludwig der Bayer* (1819) lack dramatic action and had only moderate success. Uhland was a founder of Germanic and Romance philology. Besides the treatise *Ueber das altfranzösische Epos* (1812), and an essay *Zur Geschichte der Freischiessen* (1828), there are to be especially mentioned *Walther von der Vogelweide, ein altddeutscher Dichter* (1822); *Der Mythos von Thór* (1836), the result of painstaking original investigation; and the masterly collection *Alte hoch- und niederdeutsche Volkslieder* (1844-45; 3d ed., 1892). His poetical works were repeatedly published as *Gedichte und Dramen*, while his scientific work is embodied in *Schriften zur Geschichte der Dichtung und Sage*, edited by Holland, Keller, and Pfeiffer (1865-72). Consult: Mayer, *Ludwig Uhland, seine Freunde und Zeitgenossen* (ib., 1867); id., *Ludwig Uhlands Leben: Aus dessen Nachlass und aus eigener Erinnerung zusammengestellt von seiner Wittve* (ib., 1874); H. Dederich, *Ludwig Uhland als Dichter und Patriot* (Gotha, 1886); W. L. Holland, *Zu Ludwig Uhlands Gedächtnis* (Leipzig, 1886); H. Fischer, *Ludwig Uhland: eine Studie zu seiner Säkularfeier* (Stuttgart, 1887); Bernhardt, *Uhlands politische Betätigung* (1910); A. Hartmann, *Ludwig Uhland* (Stuttgart, 1913).

UHLAND, WILHELM HEINRICH (1840-1907). A German engineer and writer on technology, born in Nordheim, Württemberg. In 1865 he founded the Technikum Mittweida, the first private institution for the instruction of machinists, and in 1868 organized the Technikum Frankenberg, near Chemnitz. He invented numerous appliances for industrial use. He founded and became editor of the periodical *Der praktische Maschinen-Konstrukteur*, and wrote: *Handbuch für den praktischen Maschinen-Konstrukteur* (1883); *Skizzenbuch für den praktischen Maschinen-Konstrukteur* (16 vols., 1867-95; 2d ed., 1906); *Die Corliss- und Ventildampfmaschinen* (1879); *Die Telefonanlagen* (1881); *Dampfmaschinen mit Schiebersteuerung* (1881); *Die Woolfschen und Compounddampfmaschinen*

(1882); *Die Hebeapparate* (1882-83); *Das elektrische Licht und die elektrische Beleuchtung* (1884); *Die Brottäckerei, Biskuit- und Teigwarenfabrikation* (1885).

UHLICH, Ὀῤῖκ, LEBERECHT (1799-1872). One of the founders of the German "Free Congregations" (q.v.). He was born at Götten, Anhalt, studied at Halle, and served as pastor in various places till 1847, when he withdrew from the Evangelical church, and thenceforth was preacher of the Free Congregation at Magdeburg. In 1841 he became the leader of the "Protestant Friends," or "Friends of Light." His liberal views frequently involved him in difficulties with the authorities. He published *Bekenntnisse* (4th ed., 1846); *Christentum und Kirche* (2d ed., 1846); *Die Throne im Himmel und auf Erden* (1845); *Handbüchlein der freien Religion* (7th ed., 1889). His autobiography appeared at Gera in 1872.

UHO, Ὀῤῥῶ. See MOHO and OO.

UHRICHSVILLE, Ὀῤῖκς-βίλ. A village in Tuscarawas Co., Ohio, midway between Pittsburgh and Columbus, on Big Stillwater Creek, and on the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Baltimore and Ohio railroads (Map: Ohio, H 5). It derives considerable commercial importance from its situation in a farming and stock-raising region, and has several large sewer-pipe and fire-clay plants. Coal is mined extensively. Pop., 1900, 4582; 1910, 4751.

UIGURS, ὤῖγυρς. A people of East Turkestan, and of Turkic stock. They founded the powerful Kingdom of Hiong-Nu, which reached its zenith in the first century A.D., when it was divided into a northern and a southern empire. The latter was destroyed by the Tunguses in the third century, whereupon the southern Ugurs retreated to the west and founded the Empire of the Huns (q.v.). In the eighth century the northern Ugurs founded a kingdom which was destroyed by the Kirghizes. In the fifth century A.D. their culture, developed on the slopes of the Tian Shan, was in a flourishing condition, and about this time they underwent considerable Buddhist and Chinese influence, their religion having already been modified to some extent by Nestorian Christians, from whom they adopted the traces of Zoroastrianism present among them. But they finally adopted the faith of Islam, and have been modified in blood and other characteristics by more recent Mongol-Chinese, Arab, and Turkic elements. Time has deprived the Ugurs of their independent nationality and much of their peculiar culture. Probably from Ugur influence the Mongols and Manchus have adopted the Syrian system of writing, and other advances in the culture of the numerous tribes of Central Asia and Siberia are, perhaps, from the Ugurs. Consult: Klaproth, *Abhandlungen über die Sprache und Schrift der Uguren* (Paris, 1820); Vámbéry, *Uigurische Sprachmonumente und das Kudatku Bilik* (Leipzig, 1870); Schott, *Zur Uigurenfrage* (Berlin, 1875); Radloff, *Aus Sibirien* (Leipzig, 1893); id., *Ethnologische Uebersicht der Türkensämme Sibiriens und der Mongolei* (ib., 1883); id., *Die alttürkischen Inschriften der Mongolei* (St. Petersburg, 1899).

UIN'TATHERIUM (Neo-Lat., from Eng. *Uintah*, mountain range in Utah + Gk. *θηρίον*, *thērion*, dim. of *θηρ*, *thēr*, wild beast). An extinct and blunt-toed (amblypod) ungulate mammal, found fossil in the Eocene fresh-water de-

posits of the western United States. The animal was about the size of a rhinoceros, with a large narrow head. The skull of the male is armed with two pairs of bony hornlike protuberances, the larger hinder pair being supported by crests of bone that slope up towards them from points near the orbits. There are two small knobs on the end of the nose. Upper incisors are absent and the upper canines of the male are enlarged to form drooping recurved tusks. The eyes were small. The brain cavity is small, indicating a ratio between weight of brain and that of body of about 1 to 4000, which is exceptionally low for a mammal.

UIST, wist, NORTH and SOUTH. Two islands of the Outer Hebrides, situated south of Lewis-with-Harris and 15 to 30 miles west of Skye (Map: Scotland, A 2). They are separated by the smaller island of Banebecula. North Uist is 18 miles long and 3 to 10 miles wide; South Uist is 22 miles long and 7 miles wide. The western parts of both are fertile and productive and the inhabitants engage in agriculture and cattle raising, as well as fishing. Pop., 1911, of North Uist, 3753; of South Uist, 5109.

UITOTAN, wê-tô'tan. An Indian linguistic stock of Colombia, South America. The Uitoto dwell on the upper Yapura River. Consult Koch-Grünberg, in *Zeitschrift für Ethnologie*, vol. xxxviii (Berlin, 1906), and id., *Zwei Jahre unter den Indianern* (ib., 1909-10).

UJ-BECSE, ō'y'-bē'chē. See BECSE.

UJFALVY, ō'y'-fāl'-ve, KARL EUGEN (1842-1904). An Austrian philologist, anthropologist, and traveler, born in Vienna of an old Hungarian noble family. Educated in the military academy at Wiener-Neustadt, he served as lieutenant in the army until 1864, when he went to study at the University of Bonn. Going to France in 1867, he was appointed professor in the Oriental Academy in 1873, and by order of the French government undertook three scientific expeditions into Central Asia, in 1876-82, the results of which were published in *Expédition scientifique française en Russie, en Sibérie, et dans le Turkestan* (3 vols., 1878-80). Among several ethnological and linguistic essays, there are to be noted: *La langue magyare, son origine, etc.* (1871); *La migration des peuples, etc.* (1873); *Mélanges altaïques* (1874), and others. After 1884 he devoted himself to art-historical researches and published in that field *Les biscuits de porcelaine* (1893).

UJHELY, SATORALJA. See SATORALJA-UJHELY.

UJI, ō'jē. A well-known suburb of Kyoto, Japan, the ancient capital of the Empire. Uji lies on the Uji River where it breaks through the gorge as it issues from Lake Biwa. The pretty village is surrounded by ancient and famous tea plantations. Pop., less than 20,000.

UJI (Jap., maggot). The Japanese name for a parasite of the silkworm, a tachinid fly (*Leskia sericaria*). It is said by Sasaki that the eggs of the parasite are laid upon the mulberry leaves and are eaten by the worms, after which the larva hatches out and feeds in the interior of the worms in the same way as do the larvæ of tachina flies. The life history is thus very abnormal, since with other species the eggs are laid upon the body of the caterpillar or other host insect. This parasite sometimes does considerable damage in Japan, but fortunately has not reached other silk-raising countries.

UJJI, ō-jē'jē. A town situated on the east

shore of Lake Tanganyika, Africa (Map: Congo, F 3). It is the terminus of the railroad from Dar-es-Salaam at the coast, some 743 miles long, and was formerly an important slave market. Here Stanley found Livingstone in 1871. Pop., about 8000.

UJI-YAMADA, ō'jē-yā'mā-dā. A town in the Prefecture of Miye, central Hondo, Japan, 73 miles by rail south of Nagoya (Map: Japan, E 6). It is filled with inns and hotels for the accommodation of the pilgrims to the near-by Isé shrines. Pop., 1898, 27,990; 1908, 37,539.

UJJAIN, ō-jin' (Skt. *Ujjayinī*, City of Victory, Gk. *Ὀζώνη*, *Ozēnē*), or OORJIN. A town of Malwa, in the State of Gwalior, Central India, on the right bank of the Sipra (Map: India, C 4). It has an active trade in opium, cotton, and grain. It was formerly encircled by a wall six miles in circumference and was one of the seven sacred cities of India; it has a spacious bazar, a grand palace of the Maharaja Sindhia, and other important monuments. Ujjain is said to have been the viceregal seat of Asoka (q.v.) during his father's reign at Patna, but is better known as the capital of the Samvat (q.v.) Kingdom founded by Vikrama (q.v.). It was the capital of Sindhia from 1750 until the seat of government was removed to Gwalior in 1810. Pop., 1901, 39,892.

ÚJVIDÉK, ō'y'-vi-dāk. A town in Hungary. See NEUSATZ.

UKASE, ū-kās' (Russ. *ukazū*, edict, from *ukazati*, to order, indicate, from *y*, in, by, near, connected with Gk. *év*, *en*, Lat. *in*, in + *kazati*, to show), or UKAS. A term applied in Russia to all orders or edicts, legislative or administrative, emanating from the government. The ukases either proceed directly from the Emperor, or are published as decisions of the directing Senate. In either case they have the force of laws till annulled by subsequent decisions. A collection of ukases in 48 volumes was made by order of Czar Nicholas in 1827, and has been supplemented from time to time. These, eliminating such as are unimportant or of temporary authority, constitute the present legal code (*srod*) of the Russian Empire.

UKERWE, ō'kā-rū-wā. See VICTORIA-NYANZA.

UKHTOMSKY, ūk-tōm'skā, ESPER ESPEROVITCH, PRINCE (1861-). A Russian author and poet, born near Oranienbaum, of an old princely family. In 1884 he was appointed to a position in the Ministry of the Interior. His *Travels in the East of Nicholas II* (London, 1896-1902), a splendidly illustrated work, published in Russian, English, French, and German, describes three journeys on which he accompanied the Czar. Besides many lyric poems, he contributed book reviews and critical and historical essays to periodicals, and in 1896 assumed the editorship of the *Sanktpeterburgskiya Vedomosti*, in which he advocated an energetic Russian policy in eastern Asia.

UKIYO-YE, ō'kyō-yā' (Jap., pictures of the passing world). The name of the modern popular school of painting in Japan, founded by Hokusai (q.v.) and continued by his pupils and successors. The beginning of the movement may be traced as far back as the end of the sixteenth century, when droll sketches were made by Iwasa Matahei (1577-1650). Towards the close of the eighteenth century Okyo painted fowls, fishes, and monkeys, their naturalism giving an immense impulse to the popularization of art.

The most common form of Ukiyo-yé is the nishiki-yé, "brocade pictures," and it is the art of the common people. Consult: Anderson, *Descriptive and Historical Catalogue of Chinese and Japanese Art* (London, 1886); Frank Brinkley, *Japan: Its History, Arts, and Literature* (8 vols., Boston, 1910); E. F. Fenollosa, *Epochs of Chinese and Japanese Art* (2 vols., New York, 1911).

UKRAINE. A name formerly applied to a part of the old Kingdom of Poland, comprising portions of the present Russian governments of Podolia, Kiev, Tchernigov, Ekaterinoslav, and Kherson, the whole of Poltava, and part of Galicia. By the Treaty of Andrussovo in 1667 the portion to the left of the Dnieper and Kiev passed to Russia, and later became known as Little Russia. The remainder was acquired by Russia at the second partition of Poland in 1793.

UKRAINIANS, ù-krân'-anz, or **LITTLE RUSSIANS** (*Malorussians*). A Slavic people numbering about 35,000,000 inhabiting the south-east of Russia (especially the governments of Volhynia, Kiev, Podolia, Kherson, Ekaterinoslav, Kharkov, Poltava, and Chernygov) and parts of Austria-Hungary. (See **RUTHENIANS**.) Compared with the Great Russians, the Ukrainians are taller, darker, and more brachycephalic and show a marked difference in temperament, manners, and customs. The Ukrainians of Russia belong to the Greek church, while those of Austria are mostly Uniates.

The early history of Russia in so far as it centres about the State of Kiev is in fact Ukrainian history. (See **RUSSIA**, *History*.) The Ukrainian principality of Galicia (Halich) which was founded in the twelfth century was annexed to Poland in the fourteenth. About the same time Ukrainian Kiev and Volhynia were wrested by Lithuania and later incorporated in Poland. Polish discipline, however, availed little against the turbulent Ukrainian Cossacks. In 1654 Khmel'nitski, or Chmielnicki (q.v.), hetman of the Zaporogian Cossacks allied himself to Czar Alexei Mikhailovich and for 100 years the Zaporogian military republic (Sich) enjoyed autonomy under the protectorate of Russia. Catharine II, however, destroyed it in 1775. The partition of Poland brought under the Russian crown all the Ukrainian lands except Galicia. See **WAR IN EUROPE**.

The dialects spoken by the Ukrainians differ from Great Russian (see **RUSSIAN LANGUAGE**) by such phonetic changes as *i* for Russian *é* (*ie*); *h* for *g*; another *i* sound for primary *o* and *e* in closed syllables; etc. The early literature of Kievite Russia (see **RUSSIAN LITERATURE**) was largely Ukrainian literature. The modern Ukrainian literature, as distinct from the Russian, was inaugurated in 1798 by Kotliarevsky (q.v.) and illustrated by such writers as the poet Shevchenko (q.v.) and the novelists and story-writers Storozhenko (1817-74), Levitski-Nechui (1838-), Panas Mirny, and Evdokia Panaev-Stanitski (1820-93). With the seventies the centre of Ukrainian literary activity was shifted to Galicia, where the Ukrainians could write without fear of government interference. The most distinguished modern writers are Boris Grinchenko (1863-1910), Ivan Franko (1856-), the novelist Kotsinbinski (died 1913), the poets Konisski (1836-1900) and Lesia Ukrainka (died 1903), and the dramatist Tobilevich (1845-1907).

Bibliography. In Russian: the histories of Efimenko (St. Petersburg, 1906); Kovalevski (ib., 1912); Grushevski's *Survey* (3d ed., Kiev, 1911) and his *Illustrated History of the Ukraine* (St. Petersburg, 1913); Pogodin, *The Slavic World* (Moscow, 1915); in Ukrainian: Grushevski's *History of the Ukrainian People* (Kiev, 1904- ; vol. i in Ger. trans., Leipzig, 1906). Periodicals: *Ruthenische Revue* (Vienna, 1903-05), continued as *Ukrainische Rundschau*; *Revue Ukrainienne* (Lausanne, 1915 et seq.); *Annales des Nationalités* (Paris, issue of March, 1913) and *Svoboda* of Feb. 29, 1916 (Jersey City). The propagandist literature in English on the so-called Ukrainian Question is fairly large. Mention may be made of Fedorchuk, *Memorandum on The Ukrainian Question* (London, 1914); Bedwin Sands (A. Raffalovich), *The Ukraine* (ib., 1914), containing a good bibliography; Steffen, *Russia, Poland and The Ukraine* (New York, 1915); and *Ukraine's Call to Freedom* (ib., 1915). There are literary histories and monographs by Franko (Lemberg, 1910), Efremov (Kiev, 1911), Ogonovski (Lemberg, 1884-86), N. Petrov, and Zhitetski; in German, Pypin and Spasovich, *Geschichte der slavischen Literaturen*, vol. i (Leipzig, 1880). Further, Pypin, *History of Russian Ethnography*, vol. iii (St. Petersburg, 1900); Grinchenko, *Literature of Ukrainian Folklore*; Levitski, *Galician Russian Bibliography of the Nineteenth Century* (Lemberg, 1888-89); *Literaturno-Naukovy Vistnik* (ib., 1898 et seq.).

ULBACH, ul'bash', Louis (1822-89). A French novelist, born at Troyes. He began his career as a journalist and took part in several violent controversies, the most notable of which concerned his accusation that Edmond About (q.v.) in his novel *Tolla* had been guilty of plagiarism. Ulbach was appointed librarian of the Arsenal Library in 1875. He wrote many popular novels, including: *M. et Mme. Fernel* (1860); *La ronde de nuit* (1874); *Le crime de Martial* (1880); *Le marteau d'acier* (1882); *Autour de l'amour* (1885); *La maîtresse du général* (1887), and *Le parrain de Cendrillon* (1888).

ULCER (from Lat. *ulcus*, Gk. ἔλκος, *helkos*, sore, ulcer, wound). An open sore; a superficial solution in the continuity of the soft parts. The tendency of an ulcer is towards continued dissolution of the tissues in which it exists, rather than towards healing, as in the case of an ordinary open granulating wound, the latter being less frequently (though properly) called an ulcer. They are usually classified according to character and mode of origin into simple and specific or infective ulcers. Infective ulcers may result from such infective diseases as syphilis, tubercle, leprosy, and glanders. Among the simple ulcers may be mentioned a number of varieties, such as the *traumatic* or *inflammatory*, the *varicose* or *chronic*, the *erethritic* or *irritable*, the *perforating* or *trophic*, the *callous* or *indolent ulcer*, the *hemorrhagic*, the *phagedenic*, and the *fungous ulcer*.

The structures to which ulceration is usually limited are the skin and mucous membranes. Upon the surface of an ulcer a layer of inflammatory exudate is found, mingled with fragments of broken-down tissue or tissue in a state of coagulation necrosis. Beneath this lies a layer of granulation tissue, composed of polynuclear leucocytes and epithelioid cells, with relatively little intercellular substance, but richly

supplied with a network of capillary blood vessels, and forming the base of the ulcer. Below this there is usually found some of the fibrous tissue of the deeper layers of the skin. The edges of the ulcer consist of the surrounding skin, more or less altered by inflammatory changes. The margins of an ulcer are occasionally undermined by the ulcerative process, or they may become firmly adhesive to the periosteum of bone or other subjacent structures. The varicose ulcer, the form most commonly seen by the surgeon, is situated usually on the front of the leg, above its lower third. Around it are generally seen the numerous dilated and congested veins whose condition is responsible for the ulcerative process. Passive hyperæmia and its resultant enfeebled nutrition are the fundamental causes of ulceration in this locality.

The treatment of ulceration in general may be regarded as constitutional and local. Constitutional treatment consists in fresh air, nourishing diet, proper hygienic surroundings, administration of iron where anæmia exists, and appropriate medication for any specific constitutional disease that may be present. Tuberculous ulcers are often healed rapidly by exposure to the sunlight. Local treatment consists in rest and elevation of the part, antiseptic measures, and the application of special local forms of treatment adapted to the conditions present at the site of ulceration. Bandaging, strapping, and the application of various stimulating substances are the measures generally employed. An ointment of "scarlet red," an anilin dye, is often applied to hasten epithelial growth. Consult: E. M. Foote, *A Textbook of Minor Surgery* (New York, 1914); E. Adams, *Treatment of Chronic Leg Ulcers* (ib., 1914); J. C. DaCosta, *Modern Surgery* (7th ed., Philadelphia, 1914).

ULEABORG, u'le-ô-bôr'y'. The northernmost government of Finland, Russia (Map: Russia, C 1). Area, 63,954 square miles, or 44 per cent of the area of Finland. The surface is densely wooded and interspersed with lakes and marshes. The climate is very severe. The chief industry is lumbering. There are also some metal works and tanneries. Pop., 1912, 326,000, almost exclusively Finns.

ULEABORG (Finnish, *Oulu*). The capital of the Government of Uleåborg, in Finland, Russia, on the Gulf of Bothnia, 498 miles by rail north of Helsingfors (Map: Russia, C 2). Its trade includes produce, coal, iron, salt, raw hides, and timber. Pop., 1913, 21,000.

ULEMA, u'lâ-mâ (Ar. *ulamâ*, pl. of *âlim*, learned, from *âlîma*, to know). The lawyers of Islam. This religion has no ecclesiastical ministry, as any one of the Faithful may lead a congregation in prayer as Imam. But, as theoretically every detail of life is to be guided by the letter of the Koran, along with all the approved traditions and orthodox interpretations, there is the necessity of a class of men learned in the canon law, to act as advisers of the Faithful in all these emergencies. The Ulemas, therefore, correspond most closely to the class of the Scribes or Rabbis in Judaism. Their province is now confined to a limited field in the Turkish Empire. By dictating details of domestic life, they wield vast authority over the people, and stand independent of, and often opposed to, the secular government. They are recruited mostly from the lower classes. The candidates go up to the schools or universities, where the scholar remains three or four years,

passing successively through the disciplines of grammar, dogma, and law. He may also pursue logic, rhetoric, etc. The great Mohammedan university is that of Cairo. The order is hierarchically graded. Above the lowest class stand the muftis and mollahs (qq.v.).

ULEX. See **FURZE**.

ULEXITE (named in honor of G. L. Ulex, a German chemist). A hydrated sodium and calcium borate that occurs in rounded masses, consisting of fine fibres. It has a silky lustre, and is white. It is an important source of borax.

ULFELDT, ūl'fêlt, KORFIZ, COUNT (1606-64). A Danish adventurer. Through marriage with Leonora Christina, the natural daughter of King Christian IV, he rose to high office, being made governor of Copenhagen and royal steward (1643). He retained his influence after the accession of Frederick III, the enmity of whose Queen, however, forced him in 1653 to flee to Sweden. In 1657 he fought against his native country, and by the Treaty of Roskilde (1658) was restored to his estates. After many vicissitudes he died a fugitive near Basel, Feb. 20, 1664. His wife was kept a prisoner at Copenhagen from 1663 to 1685, and wrote an account of her captivity in *Jammers Minde*, a notable specimen of Danish prose. She died in 1698. Consult Ziegler, *Denkwürdigkeiten der Gräfin Leonora Christina, vermählten Gräfin Ulfeldt* (Vienna, 1879).

ULFILAS, ūl'fi-las, Gothic **WULFILA**, wyl'fi-lâ (little wolf) (c.311-c.383). Bishop of the Goths, and translator of the Bible into Gothic. He was born in Dacia. Tradition relates that his ancestors were Cappadocian Christians who had been taken captive by the Goths and lived many years among them. Early in life he was a lector or reader of the Scriptures among his countrymen, and in 341 he was consecrated Bishop of the West Goths by Eusebius of Nicomedia (q.v.) at a synod at Antioch. He was then and for the remainder of his life an Arian. For seven years he worked with much success as a missionary north of the Danube. In 348 the persecution of a heathen chief compelled Ulfilas and his flock to emigrate, and, with the consent of the Emperor Constantine, they settled in Mesia, in Byzantine territory south of the Danube. For more than 30 years Ulfilas continued his activity as the apostle to the Goths; he died at Constantinople, whither he had been summoned by the Emperor. Ulfilas had a good knowledge of Greek, Latin, and Gothic, and preached and wrote in all three languages. He is remembered chiefly for his translation of the Bible, which marks not only the beginning of Christianity among his people, but of Germanic literature as well. His plan is said to have included the entire Bible with the exception of the Books of Kings, which he thought contained too much about wars for the good of his fierce countrymen. The portions of his work which have been preserved are most of the four Gospels, the Second Epistle to the Corinthians, and other fragments, comprising the greater portion of the New Testament; of the Old Testament, portions of the Books of Nehemiah and Genesis only. The chief manuscript is the so-called *Codex Argenteus*, written with silver letters on purple parchment and now in the library of the University of Upsala. Editions of all the fragments have been published by Von der Gabelenz and Löbe (3 vols., Leipzig,

1843-46); Uppström, *Codex Argenteus*, in facsimile (Upsala, 1854-57); *Fragmenta Gothica Selecta* (ib., 1861); *Codices Gothici Ambrosiani* (Stockholm, 1868); Bernhardt (Halle, 1875); Heyne (9th ed., Paderborn, 1896); Stamm (11th ed., ib., 1908). Consult also: W. Bessell, *Ueber das Leben des Ulfilas und die Belehrung der Goten zum Christentum* (Göttingen, 1860); C. A. A. Scott, *Ulfilas: Apostle of the Goths* (London, 1885); *Cambridge Medieval History*, vol. i (New York, 1911).

ULLATHORNE, ŭl'ā-thörn, WILLIAM BERNARD (1806-89). An English Roman Catholic prelate, born at Pocklington, Yorkshire. He went to sea in 1821, entered the Benedictine monastery at Downside, near Bath, in 1823, and took the vows in 1825. Ordained a priest in 1831, he was vicar general at Sydney, Australia, in 1833-36; returning to England, he agitated against the transportation system in 1836-38; and then spent two more years in Australia. In 1841 he was placed in charge of a mission at Coventry, in 1845 became Bishop of the west of England. From 1850 to 1888, when he retired, he served as Bishop of Birmingham. His writings on religious subjects include: *The Endowments of Man* (1882); *The Groundwork of the Christian Virtues* (1883); *Christian Patience* (1886). Consult his *Autobiography* (London, 1891).

ULLMANN, ŭl'män, KARL (1796-1865). A German Protestant theologian. He was born at Epenbach, Bavaria, and studied theology at Heidelberg and Tübingen. He was appointed professor at Heidelberg in 1821. In connection with Umbreit he established in 1828 the *Theologische Studien und Kritiken*. He was professor at Halle, 1829-36, after which he returned to Heidelberg. He was president of the supreme ecclesiastical council of Baden, 1856-61. His most important works were *Gregor von Nazianz* (1825; 2d ed., 1867); *Die Reformatoren vor der Reformation* (1841; 2d ed., 1866; Eng. trans., 1877); *Ueber die Sündlosigkeit Jesu* (7th ed., 1863); *Das Wesen des Christenthums* (5th ed., 1865), all of which were translated into English. His chief writings were published in five volumes (Gotha, 1863-67). Consult his *Life* by Benschlag (Gotha, 1867).

ULLOA, ŭl'yō'ā, ANTONIO DE (1716-95). A Spanish statesman and scientist, born at Seville. He entered the Spanish navy, and in 1735 accompanied to South America the French scientific expedition sent out to measure a degree of the meridian at the equator. He became rear admiral in 1760, went to Louisiana as Governor in 1764, and was made lieutenant general of the naval forces in 1770. He was sent on a secret expedition against Florida, but his zeal as naturalist made him forget his sealed orders and brought him before a court-martial (1780). He was acquitted, but lived in retirement. He wrote the important work *Noticias americanas, entretenimientos físico-históricos sobre la América Meridional y la Septentrional Oriental* . . . (Madrid, 1772).

ULLOA'S RING. See ANTHELIA.

ULLSWATER, ŭlz'wā'tēr. The largest of the English lakes, after Windermere, lying between Cumberland and Westmoreland, 10 miles east of Keswick (Map: England, D 2). Length, 8½ miles; breadth, ¼ to ¾ mile. Its scenery is rugged and grand, and one of its chief features is Helvellyn.

ULM, ŭlm. A city of the Kingdom of Würt-

temberg, Germany, and an important Imperial fortress, at the junction of the Iller and the Blau with the Danube, which here becomes navigable, 43 miles west of Augsburg (Map: Germany, D 4). Two bridges unite the city with New Ulm, a village on the Bavarian side of the Danube. The streets are narrow. The minster (a Protestant church) is the most important and beautiful example of late Gothic architecture in Germany, and next to Cologne Cathedral is the largest church in that country. It is 407 feet long, 159 feet broad, and the spire (finished 1890) is 530 feet high. The building was begun in 1377, and finished, except the spire, in 1494. The leading industries are flax, cotton, and woolen weaving; bleaching; the manufacture of paper, leather, and mixed fabrics; beer brewing, shipbuilding, printing, etc. Ulm is famed for ornamental pipe bowls, its pastry, called Ulmer bread, and its trimmed lumber. Pop., 1910, 56,109. Ulm was a free Imperial city as early as the twelfth century, and had become very prosperous by the close of the Middle Ages. In 1530 the city accepted the Reformation, and the majority of the people have since been Lutherans. In 1802 Ulm was attached to Bavaria, and became part of Württemberg in 1810. Here on Oct. 17, 1805, the Austrian general Mack surrendered to the French with about 23,000 men. Consult: Preschel, *Ulmisches Urkundenbuch* (Stuttgart, 1873); Loeffler, *Geschichte der Festung Ulm* (Ulm, 1883); Schultes, *Chronik von Ulm* (ib., 1886).

UL'MIN. See HUMUS.

UL'PIAN (DOMITIUS ULPIANUS). A distinguished Roman jurist, a citizen of Tyre, who lived in the latter part of the second and the first part of the third century. Under Septimius Severus (193-211 A.D.) he became assessor in the auditorium of Papinian, i.e., he was an associate justice when Papinian was prætorian prefect or Chief Justice of the Empire. Under Caracalla, who put Papinian to death, Ulpian retained his position; but Elagabalus stripped him of his dignities and exiled him from Rome. On the accession (222 A.D.) of the youthful Alexander Severus, to whose mother he was related, Ulpian was recalled, appointed guardian of the Emperor and prætorian prefect, and became the virtual Regent of the Empire. He was slain in 228 A.D. in a rising of the Prætorian Guard. Ulpian was one of the most prolific of the Roman legal writers. Besides voluminous commentaries on the civil law and on the prætorian edict, he published collections of cases (opinions, responses, etc.), books of rules and institutions, treatises on the powers and duties of different magistrates, and many monographs. On account of the lucidity of his style, Justinian's compilers drew more largely upon his writings than upon those of any other jurist. Excerpts from his works constitute one-third of the *Digest*. Outside of Justinian's *Digest*, only one of Ulpian's books has been even partially preserved, viz., his monograph on rules (*Liber Singularis Regularum*), which appears to have been a handbook for practitioners. It is frequently printed with the *Institutes* of Gaius, as in Muirhead's edition (Edinburgh, 1880), and in that of Abdy and Walker (3d ed., Cambridge, Eng., 1885). See CIVIL LAW; JURISCONSULT.

ULRICH, ŭl'rik (1487-1550). Duke of Württemberg. He was the son of Count Henry IV, and at the age of 11 succeeded to the dukedom, assuming personal power in 1503. He

added to the territory of Württemberg, but so impoverished the peasantry that in 1514 they rose in revolt. This he quelled only after many important concessions. By the murder of Hans von Hutten, brother of Ulrich von Hutten, he aroused the enmity of the dukes of Bavaria and the nobility. He was placed under the ban of the Empire, and was driven from the country by the Swabian League in 1519, and his possessions were sold by the league to Charles V, who transferred them afterward to his brother Ferdinand. Ulrich went over to the Protestants, and with the aid of Philip of Hesse won back his dukedom, at the head of an army of 20,000 men (1534), but only as a fief of Austria. He then carried on the work of the Reformation, joined the Schmalkaldic League, and fought against Charles V in 1546. He bought a precarious peace from the Emperor at great cost, and died in 1550 just as he was again threatened with deposition. Consult Kugler, *Ulrich, Herzog zu Württemberg* (Stuttgart, 1865).

ULRICH, ŭl'rik, CHARLES FREDERICK (1858-1908). An American painter. He was born in New York City and studied there at Cooper Institute and the National Academy, and afterward in Munich. In 1883 he was awarded the Thomas B. Clarke prize for his picture "In the Land of Promise," and was elected an associate of the National Academy. His pictures, which are detailed in treatment and minutely finished, include "The Carpenter," "A Dutch Typesetter," "The Wood Engraver," and "Glass Blowers of Murano" (Metropolitan Museum, New York).

ULRICH, EDWARD OSCAR (1857-). An American paleontologist, born at Cincinnati, Ohio. He studied at German Wallace College, Berea, Ohio, and at Ohio Medical College. He was curator of geology for the Cincinnati Society of Natural History in 1877-81, served as paleontologist to the geological surveys of Illinois, Minnesota, and Ohio between 1885 and 1896, and after 1897 was geologist of the United States Geological Survey. For ten years he was an associate editor of the *American Geologist*. His publications include: *American Palaeozoic Bryozoa* (1884); *American Palaeozoic Sponges and Palaeozoic Bryozoa* (1890); *Geology of the Lead, Zinc, and Fluor Spar District of Western Kentucky* (1904); *A Revision of Palaeozoic Systems* (1911).

ULRICH VON HUTTEN, ŭl'rik fōn hŭt'ten. See HUTTEN, ULRICH VON.

ULRICH VON LICHTENSTEIN, lĭk'ten-stĭn (c.1200-76). A German minnesinger, born in Styria, of an ancient noble race, and who was Landeshauptmann of Styria in 1245, headed the refractory Styrian nobility, and went through a terrible imprisonment in his own castle of Frauenburg. His chief work, *Frauendienst* (1255), is valuable for the history of civilization. It describes many tournaments and foolish adventures, which he, a married man and an otherwise sensible gentleman of good reputation, claims to have undertaken in the service of a high-born mistress. Unintentionally it reduced the decadent woman cult of the day to an absurdity. However, it contains some graceful lyrics. The *Frauendienst* was published by Bechstein in two volumes (Leipzig, 1888). Consult also Falke, *Geschichte der füssleichen Hauses Lichtenstein*, vol. i (Vienna, 1868); Knorr, *Ueber Ulrich von Lichtenstein* (Strassburg, 1875); Becker, *Wahrheit und Dichtung in U. von Lichtensteins Frauendienst* (Halle, 1888).

ULRICH VON TÜRHEIM, tŭr'hĭm. A Swabian noble and epic poet of the thirteenth century. Of the details of his life nothing is known. He continued, using other sources, Gottfried von Strassburg's *Tristan und Isolde*, and Wolfram von Eschenbach's *Willehalm*. The former is conjecturally dated 1240, the latter, entitled *Der starke Rennewart*, 1250. Consult: Bechstein, *Tristan und Isolde* (Leipzig, 1875); Lohmeyer, *Die Handschriften des Willehalm Ulrich von Tŭrheim* (Halle, 1882); and article by O. Kohl in *Zeitschrift für deutsche Philologie*, vol. xiii (ib., 1882).

ULRICI, ŭl-rĕ'tsĕ, HERMANN (1806-84). A German philosopher, born at Pforten, Brandenburg. He studied at Halle and Berlin, and after a brief career as a lawyer devoted himself exclusively to literature and philosophy. In 1834 he was appointed professor of philosophy at Halle, where he resided till his death. Among his works are to be mentioned: *Geschichte der hellenischen Dichtkunst* (1835); *Ueber Shakespeares dramatische Kunst* (1839; Eng. trans., 1864); *Ueber Princip und Methode der Hegelschen Philosophie* (1841); *Das Grundprincip der Philosophie* (1845-46); *System der Logik* (1852); *Gott und die Natur* (1862); *Gott und der Mensch* (1866-72). He was an opponent of the Hegelian philosophy, and endeavored to establish an empirical idealism.

UL/STER. The northernmost province of Ireland, comprising the nine counties of Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone (qq.v.). Total area, 8613 square miles. Pop., 1861, 2,389,263; 1901, 1,582,826; 1911, 1,581,696. The Presbyterians and Episcopalians constitute more than half of the inhabitants.

UL/STERITES. See PARTY NAMES.

UL/STER KING-AT-ARMS. The chief heraldic officer of Ireland. Cf. KING-AT-ARMS.

ULTIMA THULE, ŭl'tĭ-mă thŭ'lĕ. See THULE.

UL'TRAMARINE' (from Lat. *ultra*, beyond + *marinus*, marine, from *marc*, sea). A blue pigment originally obtained from the mineral lazulite, or lapis lazuli (q.v.). The finest specimens of lazulite come from various localities in Persia, Siberia, and Chile, and when ground form the pigment; but, as only a very small proportion of that mineral is available, the pigment is very expensive. In 1828 Guimet, of Toulouse, was successful in producing it on a commercial scale, and almost simultaneously a synthetical method for its preparation was announced by Gmelin, of Tübingen. For the manufacture of artificial ultramarine, sodium sulphate, china clay, and carbon are ground together and heated in crucibles, afterward being roasted with powdered sulphur. A so-called direct method, which is said to yield better results, consists in calcining in a muffle furnace a mixture of sulphur, china clay, soda ash, charcoal, and some infusorial earth. The pigment finds extensive use in the arts as a coloring material, owing to its brilliancy as a body color and high coloring power. *Cobalt ultramarine*, or Thénard's blue, is a pigment prepared by mixing freshly precipitated alumina with cobalt arsenate or phosphate, drying the mixture, and then slowly heating it to redness. Yellow ultramarine is a pigment consisting of barium chromate. Laundry blueing was formerly made from ultramarine.

ULTRA-MICROSCOPE. See MICROSCOPE.

UL'TRAMON'TANISTS (from Lat. *ultra*,

beyond + *montanus*, mountainous, relating to a mountain, from *mons*, mountain; from the geographical position of Italy relative to countries north of the Alps, and hence applied to the Italian party in the Roman Catholic church). The name applied to those who recognize the papal claim of supremacy over all national churches and sovereigns. Since 1870 it has been used also as a designation of all who accept the decrees of the Vatican Council, and in a broader sense it has been applied to the most conservative element in the Roman Catholic church. In a purely political sense it has come to be used to designate the extreme Catholic party in almost every nation of northern Europe. The Ultramontanists as a church party first appeared in the papacy of Gregory VII (q.v.), who maintained that the Pope had the power to depose and absolve temporal rulers. The enforcement of this theory would have had the effect of entirely superseding the freedom of action of the various churches, and its assertion aroused powerful opposition in the churches of Germany and France. After the Council of Constance (1414-18) (q.v.) the struggle between the Ultramontanists and the champions of the liberties of the various churches became the principal point of dispute within the ecclesiastical body. The opposition in the Gallican church was particularly active. After the reconstruction of Europe, following the Napoleonic wars, the actual influence of the Ultramontanists was decreased, although their principles were still often reasserted. In 1869-70, in connection with the meeting of the Vatican Council and the discussion of the doctrine of papal infallibility, the political aspects of Ultramontanism assumed new importance. In Germany, Austria, and France the Catholic parties in Parliament are designated by the name of Ultramontanes. Consult Hoenbroech, *Der Ultramontanismus* (2d ed., Berlin, 1898), and L. K. Götz, *Der Ultramontanismus als Weltanschauung* (Bonn, 1905).

ULTRA-VIOLET RAY (METHOD OF WATER PURIFICATION). See WATER PURIFICATION.

ULTRA VIRES, ŭl'tră vî'rēz (Lat., beyond one's powers). A legal term employed to indicate the acts of, or contracts entered into by, corporate bodies beyond the scope of the powers given to them expressly or by implication by their charters or the general law under which they were created.

Ultra-Vires Contracts. *Ultra-vires* contracts of corporations should be distinguished from those which are illegal either by statute or some rule of the common law. Strictly an *ultra-vires* contract of a corporation is without legal validity to bind the corporation because the act is without or beyond the legal powers of the corporation, that is, the powers specified in its charter or certificate of incorporation, and those necessarily to be implied therefrom, and therefore has no legal existence. Illegal contracts, on the other hand, are without such validity because of the positive prohibition of such contracts by the statute or common law on grounds of public policy. This distinction is important because of the difference in the consequences which flow respectively from *ultra-vires* contracts and illegal contracts of corporations. (For a fuller discussion of this subject, see QUASI CONTRACTS.) It is held by the English courts, by the Federal courts of the United States, and by the courts of some of the States that neither party to an *ultra-vires* contract can

acquire any true contract rights under it. In each of these courts, except the English courts, it is also held that in case either party has given his performance under such a contract, he may recover the property or thing so given in an appropriate action, or the value of the performance so given, on theory of quasi contract. The distinction between rights on the contract and in quasi contract in case of *ultra-vires* contracts is often of the greatest importance.

The second view with reference to *ultra-vires* contracts, and the one which is held in most of the States, is that so long as such contracts remain executory neither party to the contract acquires any rights under it, it being a complete answer to an action brought by either party either for damages or specific performance that the contract is invalid because *ultra vires*. If, however, either party has performed the contract on his part, the other is held to be estopped to deny its validity, and the plaintiff may recover as though the contract were originally valid. In a few States, notably New York, even although the contract is fully performed there can be no recovery unless the performance has benefited the corporation. The application of the doctrine of estoppel to such cases is anomalous and in many cases practically does away with the doctrine of *ultra vires*. In the case of negotiable paper issued *ultra vires* by a corporation, it is everywhere held that *ultra vires* is a personal and not a real defense (see NEGOTIABLE INSTRUMENTS), and cannot be set up against a bona fide purchaser for value, although it may be a valid defense against the original taker or holder of the paper. In determining what contracts are *ultra vires*, the courts have applied liberal rules of interpretation, holding not only that contracts expressly authorized were within the powers of the corporation, but that it has all the power to contract which can fairly be implied from the language of its charter and from the character of the business which it is authorized to conduct.

Torts and Crime. Strictly all torts committed by the agents of a corporation while acting for the corporation are *ultra vires*, since a corporation has no express or implied authority to commit tortious acts. Following this course of reasoning, the early tendency of the courts was to hold that corporations could not be held legally responsible for torts. Governed, however, by considerations of policy, courts now generally hold that corporations are liable for all torts of their agents and employees committed by them within the scope of their authority. When malice is an essential element in the tort, the malice of the agent is imputed to the corporate principal. Upon similar principles corporations have generally been held responsible for minor criminal offenses, and in many States there are now special statutes governing the criminal responsibility of corporations. It has even been said that a corporation may be guilty of a crime involving specific intent. See CRIMINAL LAW.

Courts of equity will take jurisdiction to restrain *ultra-vires* acts at the suit of a stockholder upon his showing that the directors or trustees of the corporation refuse to act. There is also statutory authority in some States for proceedings brought in behalf of the State by the Attorney-General to restrain *ultra-vires* acts when they are working a public injury, and at common law the State may proceed on the rela-

tion of a private individual to compel forfeiture of the charter of a corporation by *quo warranto* (q.v.) on the ground that the corporation is committing *ultra-vires* acts under such circumstances as to amount to a departure from the business or purposes for which it was organized. Consult the authorities referred to under CORPORATION; CRIMINAL LAW; EQUITY; QUASI CONTRACT.

ULUA, ōō'wā, **WOOLWA**, wōō'wā, or **SUMO**. A group of tribes including the Sumo proper, the Cookra, the Poya, and others, occupying the headwaters of the streams which empty along the east coast of Nicaragua. They call themselves Sumo, the other names having probably been bestowed by their enemies, the Mosquito (q.v.). They are below middle stature, of light brown complexion and handsome features, with chests and arms strongly developed. They live in huts consisting of palm-leaf roofs raised upon posts, accommodating four families. The women wear only a short skirt of bark fibre. Painting is common, and they also flatten the head. They plant corn, cacao, sugar cane, and chile, and the women are potters, while the men are expert boatmen and lumberers. Polygamy prevails, and girls are frequently betrothed almost in infancy. Boys are subjected to manhood ordeals. Their dead are buried under sheds, and they unwind a long thread from the former owner's house to the grave. Recent investigations by Dr. Lehmann have shown that the language of the Ulua or Sumo group of tribes is recently connected with that of the Mosquito tribes of the coast and the Matagalpa of the interior.

ULUGH-BEG, ōō'lūg-bēg' or -bā' (1394-1449). A Persian prince and astronomer, the grandson of Timur (q.v.). He succeeded, in 1447, to the Imperial throne of Samarkand on his father's death. He was a successful warrior, but was finally defeated, captured, and put to death by his eldest son, who had been driven to rebellion by his father's unjust suspicions of his loyalty.

Ulugh-Beg founded the observatory at Samarkand. He is noted as a patron of astronomers, and was himself a diligent observer. His principal contribution to astronomical science is his star catalogue, the first original one since that made by Ptolemy. The astronomical works of Ulugh-Beg were written in Arabic, afterward translated into Persian, and thence the chronological portion of them into Latin by Greaves (London, 1650), and the geographical part (1652). An independent version in Latin and Persian was published by Hyde (Oxford, 1665). The latest edition of the star catalogue was edited by Baily in 1843, and published in the *Memoirs of the Royal Astronomical Society*, vol. xiii (London, 1843).

ULVA. A marine genus of the green algae (Chlorophyceae) (q.v.), known as sea lettuce, the flat membranous body resembling a leaf in appearance but not in structure.

ULVERSTON. A seaport in Lancashire, England, 22 miles northwest of Lancaster (Map: England, C 2). Its parish church dates from 1111. It stands in an extensive agricultural and mining district, and has manufactures of iron, boilers, linen, paper, ropes, hardware, and chemicals. Pop., 1901, 10,064; 1911, 9552.

ULYSSES, ū-lis'ez (Lat. *Ulysses*, *Ulixes*, *Olixes*, Athen., Bæot., Corinth. Gk. Ὀδυσσεύς, *Olysseus*, Ὀλυρρεύς, *Olytteus*, general Gk. Ὀδυσσεύς, *Odyseus*, probably of Illyrian origin, influenced by

popular connection with ὀδύσσειναι, *odyssessthai*, to be hated). A legendary Greek hero. According to the oldest legend, the Homeric, he was the son of Læertes (q.v.), Prince of Ithaca, and of Anticleia, daughter of Autolycus. According to a later account, his father was the crafty Sisyphus (q.v.), whence he is sometimes called, by way of reproach, Sisyphides. He married Penelope (q.v.), by whom he became the father of Telemachus (q.v.). When the expedition against Troy (q.v.) was resolved on, Agamemnon and Menelaus prevailed on Ulysses, though with difficulty, to take part in it. Later traditions represent him as feigning madness—an artifice which failed through the skill of Palamedes. Once enlisted, Ulysses devoted himself to the success of the expedition; with Nestor's aid he secured the help of Achilles, and with Menelaus he undertook a fruitless embassy to Troy to demand the return of Helen and her treasures. When the Greek fleet assembled at Aulis, Ulysses brought 12 ships. In the narrative of the *Iliad* Ulysses plays an important part. In prudence and ingenuity of resource he is the foremost of the Hellenic chiefs, while in courage he is inferior to none. His later trait of trickery is seen in the episode of Dolon, but in the Homeric poems he is generally represented as a model of the older, as Achilles is of the younger, hero. After the fall of Troy, the Homeric narrative of his long wandering on his return to Ithaca is contained in the *Odyssey*. His ships were driven by a storm on the coast of Thrace, where he plundered the land of the Cicones, but lost a number of his crew. When he reëmbarked, a north wind blew his vessels to the country of the Lotophagi (the Lotus-eaters), on the coasts of Libya, where some of the companions of Ulysses ate of the wondrous fruit, and wished to rest forever. But their leader compelled them to leave the land, and, sailing north again, they touched at the Island of Goats, where Ulysses left all his ships but one. Thence he proceeded to the land of the Cyclopes, where occurred the adventure in the cave of Polyphemus (q.v.). With his reunited fleet he now visited the island of Æolus, ruler of the winds, who gave him a favoring breeze, and the unfavorable winds tied in a skin. This his companions, in search of treasure, opened, and at once they were swept back to the island, from which they were now sternly excluded. They then reached the land of the Læstrygonians, a race of cannibals, who destroyed all the ships but one. Escaping with his solitary ship, he next landed on the island of Ææa, inhabited by the sorceress Circe (q.v.). After a year's sojourn he was sent by Circe to the Kingdom of Hades, to inquire about his return from the seer Tiresias (q.v.). Tiresias disclosed to Ulysses the fact of the implacable enmity of Poseidon, whose son, Polyphemus, he had blinded, but encouraged him at the same time with the assurance that he would yet reach Ithaca in safety, if he would not meddle with the herds of Helios (the sun god) in Thrinacia.

Ulysses next passed in safety the perilous island of the Sirens (q.v.), but, when he sailed between Scylla and Charybdis, Scylla devoured six of his companions. He next came to Thrinacia, where his crew insisted on landing, and while storm bound killed, in spite of their oath, some of the cattle of Helios while Ulysses was asleep. When they had sailed away a fierce storm arose, and Zeus sent forth a flash of light-

ning that destroyed the ship. Every one on board was drowned except Ulysses, who, clinging to the mast, was finally washed ashore on the island of Ogygia, the abode of the nymph Calypso, with whom he lived for eight years. The nymph offered him immortality if he would remain, but his love for Penelope and longing for his home were too deep, and at the entreaty of his special guardian, Athena, Zeus sent Hermes to command his release. Sailing eastward in a skiff of his own building, he was seen by the implacable Poseidon, who roused against him a terrible storm, which wrecked his skiff. He barely escaped, by the aid of Leucothea, to the land of the Phæaciens. Naked and worn by fatigue, he fell asleep, but was awakened by the sport of Nausicaa, daughter of the King, Alcinous, and her maidens. She received him kindly and brought him to the city. Entering the palace under Athena's protection, he was entertained by the King, who promised him safe convoy to his home. On the magic Phæacian ship he fell asleep, and was landed, with the rich presents of the Phæaciens, while still unconscious.

Disguised as a beggar, he repaired to the hut of the swineherd Eumæus, where he met and revealed himself to Telemachus. The next day he was brought by Eumæus to the palace, where he was recognized by his old dog, Argus. Here he was harshly treated by the suitors of his wife, who were living riotously on his estate. After an interview with Penelope, to whom he foretold her husband's return, he was recognized by his old nurse, Eurycleia, whom he bound to silence. When the suitors all failed to string the great bow, he took it, easily strung it, and shot the arrow through a row of 12 axes, thus accomplishing the test Penelope had proposed for the suitors. Then, aided by Telemachus, Eumæus, and the neatherd Philotus, he slew all the insolent suitors. The last book of the *Odyssey* records his recognition by his father, Laërtes, and a final reconciliation with the friends of the suitors, brought about by Athena's aid. The Homeric poems have a tradition of further wanderings to appease Poseidon, by introducing his worship among a people who knew not the sea, and finally a happy old age and painless death. Allusions show that to Ulysses was also given a prominent place in other episodes of the Trojan War, such as the battle over the body of Achilles, the invention of the device of the wooden horse, and the final sack of Troy. The other epics (see CYCLIC POETS) enlarged these episodes and added others, in which Ulysses frequently played but a mean-spirited part. This degradation of his character continued in many of the plays of the Attic tragedy, and was further developed in later writers, especially the comedians, and, of course, by the Romans, since to them, as the descendants of the Trojans, he was the archenemy of their race. His death in these narratives was usually attributed to his son by Circe, Telegonus (q.v.), who had been sent by his mother in search of his father. Landing in Ithaca, he was met in arms by Ulysses, and slew him with a spear tipped with the sting of a ray, thus fulfilling the prophecy that death should come to him from the sea. Consult the article "Odysseus," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

UMĀ, उमा. In Hindu mythology, one of the principal names of the consort of the god Siva (q.v.), also called Durga (q.v.), Devi (q.v.),

Kali (q.v.), Parvati (q.v.), Bhavani, and regarded either as beneficent or malignant. The myths relating to this goddess, who is worshiped especially in Bengal, are recounted in the great epic poems and Puranas (q.v.), but the textbook of her worshipers is the *Dēvimahātmya*, or the majesty of Devi, and a portion of the *Mārkaṇḍeya Purāṇa*. In the *Rāmāyaṇa* (q.v.) she is the daughter of the nymph Mena and of Mount Himalaya, whence her names Parvati, Haimavati, and similar ones, meaning "the mountainous" or "the mountain-born." According to the Puranas, in a former life she was Sati, the daughter of Daksha (q.v.), but it was only as Uma that she bore to Siva Gaṇeśa (q.v.), the god of wisdom, and Kartikeya (q.v.), the god of war. According to the *Harivaṃśa* (q.v.) in another life she was born as the daughter of Yaśoda, and exchanged for Vishnu (q.v.), when, in his incarnation as Krishna (q.v.), he was born as a son of Devaki. On that occasion she was killed by Kansa, and became a divine virgin, whence she was called Kanya, or Kumari, the virgin. The principal myths concerning her were her destruction of the demons Madhu, Kaitabha, and Mahisha, her defeat of the army of the demons Chanda and Munda, and her destruction of the demons Raktavija, Sumbha, and Niśumbha. In commemoration of her victory over Mahisha, a festival called the Durgapuja, or Durgotsava, is annually celebrated in Bengal, followed three weeks later by another, the Kalipuja, in honor of her destruction of Chanda and Munda. She dwells with Siva on Mount Kailasa, a peak of the Himalaya. Consult: John Muir, *Original Sanskrit Texts*, vol. iv (2d ed., London, 1873); W. J. Wilkins, *Hindu Mythology* (2d ed., ib., 1900); L. D. Barnett, *Antiquities of India* (ib., 1913). See *Parvati* in the *PLATE OF HINDU DEITIES* with INDIA.

UMAN, уман'. A district town in the Government of Kiev, Russia, on the Umanka, 170 miles south of Kiev (Map: Russia, D 5). It has two palaces belonging to the counts Potocki. Pop., 1910, 41,678, of whom more than half were Jews.

UMATILLA. A tribe of Shahaptian stock (q.v.) formerly near the junction of the Umatilla and the Columbia in northeastern Oregon, and now with the Cayuse and Wallawalla upon a reservation in the same neighborhood. Like neighboring tribes, they subsisted originally on fish, game, and berries, and did not practice agriculture. They were visited by Lewis and Clark in 1804, and about 40 years afterward by Jesuit missionaries, by whom some were converted and civilized. By a treaty of 1855 they agreed to come upon their present reservation. In 1910 they numbered 272.

UMAYYADS. See *OMMIYADS*.

UMBA'GOG LAKE. One of the Rangeley Lakes (q.v.).

UMBĀLLA, ум-бā'ла. The capital of a district in the Punjab, India. See *AMBALA*.

UMBEL. A form of inflorescence (q.v.).

UMBELLIFERÆ (Neo-Lat. nom. pl., from Lat. *umbella*, umbrella, umbel, diminutive of *umbra*, shadow, shade + *ferre*, to bear). The *PARSLEY* FAMILY. A large and important family of dicotyledonous herbs and a few shrubs containing about 250 genera and 2000 species generally characterized by the inflorescence, an umbel which is often compound. The mature fruit is necessary for the determination of most of the genera and many of the species. The

species are widely distributed, but are not abundant in tropical regions. They generally have divided or compound, rarely simple, leaves, and usually abound in a resinous secretion, and volatile oils, on account of which many are reputed poisonous. Acridity is their general characteristic. Some are pleasantly aromatic, others have a powerful and disagreeable smell. In the roots of some, especially when enlarged by cultivation, starch and sugar are stored, so that they become useful for food. Many of the genera contain species of economic importance, the better known ones being *Daucus* (carrot), *Pastinaca* (parsnip), *Apium* (celery), *Faniculum* (fennel), *Carum* (caraway), and *Coriandrum* (coriander). Among the more common genera of the North American flora are *Eryngium* (snake-root), *Sanicula* (black snakeroot), *Hydrocotyle* (pennywort), *Osmorhiza* (sweet cicely), *Conium* (poison hemlock), *Cicuta* (water hemlock), *Sium* (water parsnip), *Thaspium* (meadow parsnip), *Heracleum* (cow parsnip), and *Angelica*. The name *Apiaceæ* is given by some botanists to the family Umbelliferae.

UMBER (from Fr. *ombre*, from Lat. *umbra*, shadow, shade). A mineral pigment resembling ochre, but differing from true ochre (q.v.) in containing some oxide of manganese. It is soft, earthy, and of a dark-brown color. It occurs at many localities in Europe, notably in the island of Cyprus, and is also mined in Illinois, Pennsylvania, Georgia, and New York. Raw umber yields a brown paint, while burnt umber has a redder tinge. Both are stable and can be mixed with water or oil. See PAINT, MINERAL; OCHRE.

UMBERTO, ūm-bēr'tō. See HUMBERT I.

UMBILICAL CORD (from Lat. *umbilicus*, navel; connected with Gk. *ὀμφαλός*, *omphalos*, OIR. *imblin*, OHG. *nabalo*, Ger. *Nabel*, AS. *nafela*, Eng. *navel*), or NAVAL STRING. The bond of communication between the fetus (which it enters at the umbilicus, or navel) and the placenta, which is attached to the inner surface of the maternal womb. It consists of the umbilical vein lying in the centre, and the two umbilical arteries winding from left to right round the vein. Contrary to the usual course, the vein conveys arterial blood to the fetus, and the arteries return venous blood to the placenta. These vessels are embedded in a yellow gelatinous matter, known from its first describer (in 1659) as the jelly of Wharton. Nerve filaments have been traced into the cord; but the presence of lymphatics is doubtful. The whole is invested by a membrane (the amnion), and its ordinary length is about 20 inches. As soon as a child is born, and its respiration fairly established, the umbilical cord is tied and divided near the navel, which spontaneously closes, the fragment of cord dying away. See FETUS and PLACENTA.

UMBILICAL HERNIA. The term applied to the protrusion of intestine at the navel or umbilicus. It is of most frequent occurrence shortly after birth; but it is not uncommon in women who have been frequently pregnant. See HERNIA.

UMBILICUS, ūm-bil'ī-kūs. The anatomical term for the navel.

UMBRA (ūm'brā) TREE. See OMBU TREE.

UMBRELLA (from It. *ombrella*, umbrella, parasol, Lat. *umbra*, shade). In its origin, and still in the Far East, a sunshade or movable canopy regarded as a privilege of high rank, and used in ceremonial processions. In England and America the term has become restricted to

round, folding shades, with high ribbed frame of steel or cane covered with silk or cotton, used principally for protection against rain, and equivalent to the French *parapluie* (against the rain). The small, fancy umbrellas used by women in Europe and America as sunshades bear the name "parasols" (against the sun). Similar sunshades were used by the women of ancient Greece and Rome. See COSTUME.

UMBRELLA BIRD. A black South American bird (*Cephalopterus penduliger*), the size of a crow, whose head is ornamented with a crest forming a covering somewhat like a parasol, composed of straight elevated feathers with white and stiff shafts terminated by black beards which project forward. The sides of the neck are naked, but long, black, glossy, metallic feathers, forming a loose pelerine hanging below the breast, spring from the throat and sides of the neck. The tail is long and slightly rounded. There are two other closely allied species. They live in deep woods, make rough stick nests, and utter cries, especially at twilight, described as "lowings." See COTINGA and Plate of COTINGAS, ETC.

UMBRELLA PLANT. See CYPERUS.

UMBRELLA TREE. See CHINA TREE; MAGNOLIA.

UMBRETTE'. A peculiar heron-like bird (*Scopus umbretta*) representing alone an African family (Scopidae) closely related to the shoebill (*Balaniceps*). It is a native of the wooded regions of Madagascar and most of Africa. It has a body about the size of a common fowl's, long naked legs, with very large, slightly webbed toes, and a large head with a long, keeled, storklike beak, surmounted by a great crest, suggesting in profile the name "hammerhead" given by many English observers. The plumage is purplish brown, with black tail bars; and its smoky tints make it almost invisible at dusk. At night, according to Evans, it roosts in trees. Its food consists of fish, reptiles, frogs, worms, mollusks, and insects from shallow water. The note is a harsh quack or weak metallic sound. The nest is an enormous structure of sticks, lined with roots, grass, rushes, or clay, having a hole at the side; it is placed in a tree, on a ledge, or rarely on the ground. Three to five white eggs form the complement.

UM'BRIA. In ancient geography, a country of central Italy, corresponding loosely with the modern territorial division of the same name, which constitutes the Province of Perugia (Map: Italy, D 3). At an early date the name Umbria was applied indefinitely to a large territory in central and north Italy. The Umbrians were among the oldest and most powerful nations of Italy, and probably once held all the land in central Italy between the Adriatic and the Tyrrhenian Sea. This territory was gradually decreased by the encroachment of the Etruscans on the west, of the various Celtic tribes on the north, and of the Picentes on the south, until the Umbrians were shut off from the sea in the valleys east of the Apennines.

Umbria at the period of the Roman conquest of Italy was bounded on the north by the *Ager Gallicus*, on the east by Picenum, on the south by the country of the Sabines, and on the west by Etruria. The historical prominence of the Umbrians ends with the beginning of the third century B.C.; they were defeated by Rome in 308 B.C., and, with the other confederated peoples,

were crushed at the battle of Sentinum, 295 B.C. After 220 B.C. the Via Flaminia ran through the country. Umbria, together with the *Ager Gallicus*, which had been restored to the territory after the conquest of the Senones by the Romans, constituted the sixth region of Italy in Augustus' division. Knowledge of the Umbrian civilization and language has been gained chiefly from inscriptions, as the accounts left by ancient writers are of uncertain value. The most important of these epigraphical remains are the seven bronze tablets found at Gubbio (the ancient *Iguvium*, the medieval *Eugubium*) in 1444. See EUGUBINE TABLES; also, for the language, ITALIC LANGUAGES, *Umbrian*.

The district known in modern times as Umbria was a part of the Papal States until 1860. The Province of Perugia has an area of 3748 square miles. Pop., 1901, 675,352; 1911, 686,596. The surface is mountainous, but the valleys are fertile. Capital, Perugia (q.v.). See also LATIN LANGUAGE.

UMBRIAN SCHOOL OF PAINTING. The name applied to the Central Italian painters of the Renaissance, living chiefly within the modern Province of Umbria. The Umbrian school is characterized by its intense but dreamy religious sentiment, evident in the ecstatic expression of the faces. The Umbrians had admirable illustrative qualities and good color, but they were deficient in form and dramatic action. Though usually classed as Umbrians, the principal painters of the northern part of this territory had strong affiliations with the Florentines and differed from the others in depicting form and movement. Such artists were Piero della Francesca (died 1492), and his pupils, Melozzo da Forlì and Luca Signorelli. Gentile da Fabriano (died 1427) may be considered the first great Umbrian painter. Fra Angelico's pupil Benozzo Gozzoli (died 1497) exercised a strong influence on the Umbrian school. Its founder in the narrower sense was Niccolò da Foligno, and the first important Perugian master was Bonfigli; then in the later fifteenth century came Fiorenzo di Lorenzo, Pinturicchio, and Perugino, its best-known master next to his pupil Raphael. All the best qualities of the school culminated in Raphael, who added the best that Florence and the antique could give. A characteristically Umbrian contemporary of Raphael was "Lo Spagna" at Spoleto. Consult: Bernhard Berenson, *Central Italian Painters of the Renaissance* (New York, 1897); the monographs by Jules Destrec (Brussels, 1900); Umberto Gnoli (Bergamo, 1908); Emil Jacobson (Strassburg, 1914), and the works cited under FLORENTINE SCHOOL OF PAINTING.

UMBRIEL, ūm'brī-ēl. See URANUS.

UMBRINE. A fish. See MEAGRE.

UMLAUT, ūm'lout, FRIEDRICH (1844-). An Austrian geographer and author, born and educated in Vienna, where he became professor at the state Gymnasium of Mariahilf and at the municipal Teachers' College in 1870. He wrote: *Die österreichisch-ungarische Monarchie* (3d ed., 1897); *Die Alpen, Handbuch der gesamten Alpenkunde* (1887; Eng. trans., 1889); *Das Luftmeer, Grundzüge der Meteorologie und Klimatologie* (1891; Swed. trans., 1897); *Namenbuch der Stadt Wien* (1895, 1905); and edited *Die Länder Oesterreich-Ungarns in Wort und Bild* (15 vols., 1880-89). From 1882 to 1910 he was editor of the *Deutsche Rundschau für Geographie und Statistik*.

UMLAUT, ūm'lout (Ger., sound-change). In comparative philology, the change undergone by a vowel or diphthong through the influence of a following vowel. It is, therefore, essentially a process of regressive vowel assimilation. Another form of umlaut, or process of progressive vowel assimilation, is contained in the so-called law of vowel harmony of the Ural-Altaic languages (q.v.). It occurs frequently throughout the Indo-Germanic linguistic group, although it is a characteristic only of the Germanic languages. As more or less sporadic examples of umlaut, occasionally called mutation, or metaphony, by English writers, may be cited Av. *vohu*, good, *mošu*, soon, but Skt. *vasu*, *maksu*; Armen. *keam*, I live, but Skt. *jivāmi*; Bæot. Gk. *ῥπέρεδδα*, table, but Attic *ῥπάρετα*; Attic Gk. *ἡμῶν*, half, beside *ἡμῶν*; Lat. *nihil*, nothing, from *ne hilum*, not a thing; Vulgar Lat. *viuillum*, banner, *butumen*, pitch, but Lat. *veuillum*, *bitumen*; OIr. *cloth*, famous, but Gk. *κλῡτός*; OChurch Slav. *bǫdrinŭ*, watchful, beside *bǫdrinŭ*, *bǫdrŭ*, Lith. *budrŭ*. In Germanic umlaut is caused either by *i* or *u*. The *i* umlaut changes a preceding *e* to *i*, and *a* to *e*, as Goth., OHG. *ist*, is, but Gk. *ἔστι*; OHG. *gesti*, plural of *gast*, host. In MHG. the *i* umlaut changes *o*, *u*, *ā*, *ō*, *ū*, and *uo* to *ī*, *ē*, *ae*, *oe*, *iū*, and *üe* respectively, as *löcher*, plural of *loch*, hole; *süne*, plural of *sun*, son; *gaeben*, subjunctive of *gāben*, gave; *hoeren*, present of *hōrte*, heard; *brüte*, plural of *brūt*, bride; *güete*, goodness, from *guot*, good. The chief *i* umlauts in Anglo-Saxon are of *æ*, *ā*, *o*, *ō*, *u*, and *ū* to *e*, *æ*, *e* (or usually *y*), *ē*, and *y* respectively, as AS. *weccan*, to wake, Goth. *wakjan*; *hælan*, to heal, from *hāl*, health; *even*, plural of *owa*, ox, and *gylden*, golden, from *gold*, gold; *dēman*, to judge, from *dōm*, judgment; *wyllen*, woolen, from *wulle*, wool; *cypan*, to proclaim, from *cūþ*, famous. In Icelandic also the *i* umlaut plays an important part. In the Teutonic languages, umlaut is found in Anglo-Saxon as early as the sixth century, and is fully developed in Low German by the eighth century. From the tenth century onward it makes its appearance also in the dialects of Middle and Upper Germany.

The *u* umlaut is less far-reaching than the palatalization caused by *i*. It does not seem to have occurred in Gothic or in High German. It is found, however, in Anglo-Saxon and, highly developed, in Icelandic. In Anglo-Saxon a before *u* or *o* becomes *ea*, *e* becomes *eo*, and *i* becomes *io*, although these umlauts are by no means regular in their action. Examples are *ealu*, ale, but genitive *alo*, *ealo*, Northumb. *ales*; *weorod*, folk, beside *werod*; *mioluc*, milk, but Goth. *miluks*. The principal Icelandic *u* umlauts are of *a* to *o*, *ā* to *ō*, *e* to *ē*, *ē* to *ö*, *i* to *y*, *ī* to *y*, *æi* to *öy* or *ey*, *ia* to *ío*, *ua* to *uo* or *o*, *uā* to *ō*, *ui* to *y*, *ui* to *ý*, and *uæ* to *ö*. There are other minor umlauts. Anglo-Saxon has a palatal umlaut which changes the *eo* and *io*, arising from the breaking of Germanic *e* and *i* before a guttural *h* plus a consonant, to *ie* and later to *i*, *y*, and before palatals *ea* and *ēa* later became *e*, *ē*. Examples are *riekt*, *ryht*, right, beside *reocht*, OHG. *reht*; *Wiht*, Wight, beside *Wioht*; *sew*, knife, beside earlier *seaw*; *ēge*, eye, beside earlier *ēage*. In Icelandic there are traces of an *r* umlaut, as in *ær*, they (feminine), but OSwed. *par*, Goth. *pās*. In German umlaut survives as an important element in the inflection. It is found especially in nouns, as *Brüder*, plural of *Bruder*, brother (but OHG. *bruoder* for both

numbers); *Söhne*, plural of *Sohn*, son (OHG. *sunī*, *sun*); *Hände*, plural of *Hand*, hand (OHG. *henti*, *hant*); *Lämmer*, plural of *Lamm*, lamb (OHG. *lambir*, *lamb*). It also characterizes the comparative and superlative degrees of adjectives, as *jung*, young, *jünger*, *jüngst* (OHG. *jung*, *jungiro*, *jungisto*), and is seen in the imperfect subjunctive of certain verbs, as *hätte* from *haben*, to have (OHG. *habēti*). In English there are only sporadic traces, as in *men*, *mice*, *feet*, as plurals of *man*, *mouse*, *foot* (AS. *men*, *mēn*, *mīfs*, *fēt*, plurals of *man*, *mūs*, *fōt*), and in causative verbs, as *set* from *sit* (AS. *settan* from *sittan*, Goth. *satjan* from *sitan*, pret. *sat*). Consult: Victor Henry, *Short Comparative Grammar of English and German* (London, 1894); W. Wilmanns, *Deutsche Grammatik* (3 vols., Strassburg 1893-1906; vol. i, 2d ed., 1897); H. Lichtenberger, *Histoire de la langue allemande* (Paris, 1895). See ENGLISH LANGUAGE; GERMAN LANGUAGE; TEUTONIC LANGUAGES; and special titles devoted to the different languages mentioned in this article.

UMMERAPOORA, See AMARAPURA.

UMPQUA, ūmp'kwā. An Athapascan tribe.

UMRITSAR. A city of the Punjab, India. See AMRITSAR.

UNA, ū'nā. The principal female personage in the first book of Spenser's *Faerie Queene*. She stands in the allegory for Truth. She is the companion of the Red Cross Knight (q.v.) on his mission from the court of Gloriana, but is soon separated from him by Archimago and undergoes many painful adventures until rescued by Prince Arthur and restored to her knight.

UNAKA MOUNTAINS (called also, in whole or in part, the SMOKY or GREAT SMOKY MOUNTAINS). A southwestern division of the Appalachian Mountains, branching from the Blue Ridge in south Virginia, and extending southwestward near the Tennessee and North Carolina boundary, penetrating a short distance into north Georgia (Map: North Carolina, A 4). On the west they are separated from the Cumberland plateau by the great eastern valley of the Tennessee, and on the east they are connected with the Blue Ridge by an intricate system of cross ranges forming the rugged remnants of a lofty plateau culminating in the Black Mountains. Nearly all the eastern headstreams of the Tennessee rise on this inclosed plateau and break through the Unaka Range. Otherwise the latter forms a sharply defined ridge between Tennessee and North Carolina. In the north there are three main ridges inclosing fine valleys. The average elevation of the main ridge is from 3000 to 5000 feet, the middle portion, generally known as the Great Smoky Mountains, being the highest. Here a number of peaks rise to 6000 feet, extending their rocky summits above the timber line. The highest is Clingman Peak (Yancey Co., N. C.) with an altitude of 6611 feet. The range is composed chiefly of Lower Silurian sandstones and shales, with some Archean metamorphic rocks. The slopes are covered with pine forests, and the range abounds in grand and rugged scenery.

UNALASKA, ū'nā-lās'kā, or **UNALASHKA**. The second largest and most important of the Aleutian Islands, 135 miles southwest of the extremity of the Alaska Peninsula (Map: Alaska, E 9). It is about 75 miles long and from 10 to 25 miles wide; its coasts are indented with fiords, and it consists mainly

of barren and treeless mountains, among which rises the volcano of Makushin to a height of 5691 feet. The island is thinly populated by Aleuts and a few Russians and Americans, chiefly engaged in fishing and sealing. The largest inhabited place is Unalaska Village or Iliuliuk, with a population in 1915 of about 400. It has a government school of about 80 pupils. It is a port of call for vessels navigating Bering Sea.

UNALGA (ŭ-nāl'gā) ISLAND. An island of the Andreanof group, Alaska, situated in about 54° N., 166° W. It has a wireless station of the United States navy, and was made a lighthouse reservation in 1901.

UNAU, ū-nā' or ŭ-nou'. The two-toed sloth (q.v.).

UN'CAS (?-c.1683). A famous sachem of the Mohegan (q.v.) Indians in Connecticut. At first a Pequot chief, he revolted about 1635 and collected a number of Indians, who took the name of Mohegans, which had once belonged to the Pequot (q.v.), against whom he fought as an ally of the English in the Pequot War of 1637. He was rewarded by the whites with a grant of Pequot lands. In 1643 he defeated the Narraganset chief Miantonomo (q.v.), and later, with the sanction of the commissioners representing the United Colonies of New England, had him put to death. In 1648 the Mohawks and Pocumtucks began an unsuccessful war against him. In 1657 he was besieged by the Narraganset sachem Pessacus, but, according to tradition, was relieved by Ensign Thomas Leffingwell. The date of his death is unknown, though he is known to have been alive in 1682. Consult S. G. Drake, *The Book of the Indians of North America* (Boston, 1834), and W. L. Stone, *Uncas and Miantonomoh, a Historical Discourse* (New York, 1842).

UNCIAL (ŭn'shī-al) LETTERS. A term applied in Greek and Latin paleography to a modification of capital letters, which are made rounded instead of square, as being written on papyrus or vellum. See PALEOGRAPHY, *Letters and their Forms*.

UN'CINA'RIA. See ANKYLOSOMIASIS; HOOKWORM DISEASE.

UNCLEANNES. As used in the Old Testament, a term having several shades of meaning. In its primary sense it signifies a bodily condition which during its continuance excluded from the holy community. Such a condition might be produced by a variety of causes, as childbirth (Lev. xii), contact with a dead body (Num. xix. 11-12), or leprosy (Lev. xiii-xiv). Various purificatory rites are prescribed in the Pentateuchal codes to free from this condition. In a wider sense the term "unclean" is applied to animals prohibited as food (Lev. xi; Deut. xiv. 3-21), and the fruit of trees was unclean (i.e., could not be eaten) for the first three years (Lev. xix. 23). Certain bodily functions (connected with reproduction) were generally regarded in early times as rendering a person unfit to perform religious rites, or, in other words, to approach the deity.

The stipulations in regard to certain animals regarded as unclean belong in a different category. In many regions certain animals are considered sacred either because a clan regards itself as descended from a particular animal or because for other reasons the animal in question is supposed to afford protection to the clan. Thus the animal formerly regarded as sacred comes to be avoided as unclean. And

connection with the widespread symbolism of giving to deities the shapes of animals leads to the conception that certain animals are to be avoided because of their demoniac nature. In the Pentateuchal regulations all these factors may be traced—the sanctity attached to certain animals, their position as totems, as well as the later conception which regarded them as the abode of evil spirits.

In primitive religions disease is ascribed to the presence of a demon or evil spirit in the body, brought there by the power of a sorcerer or witch. A cure is thought to be effected by certain rites in which sympathetic magic plays a prominent part. In the Pentateuchal codes, however, an advance in religious ideas is manifested by designating a diseased person as one smitten by God. The disease chiefly dealt with is a form of leprosy, which is still common in the East. From disease to death is but a short step, and the primitive views held in regard to death led to precautions to be exercised by those who are obliged to touch a dead body. On the one hand, death itself indicates the triumph of the evil spirit, while on the other, the uncertainty as to the whereabouts of the soul or spirit of the dead person incites fear and leads to precautions against the unexpected return of the spirit perhaps only temporarily absent. By a natural extension of the term the dead person is regarded as unclean.

The rabbinical schools in Babylonia and Palestine elaborated the subject still further, and in the Talmud the laws and degrees of the various kinds of uncleanness are set forth in great detail accompanied with minute discussions of casuistical problems in connection with the subject. The extension of the term "unclean" to the fruits of trees for the first three years is quite secondary, and dates from the late period when it had acquired the general sense of forbidden, without reference to any genuine uncleanness connected with the transgression involved. The prohibition appears to have been an economic regulation to insure productiveness. Consult the commentaries on the passages cited: B. Stade, *Geschichte des Volkes Israel*, vol. i (Berlin, 1887); I. Benzinger, *Hebräische Archäologie* (2d ed., Tübingen, 1907).

UNCLE SAM. See NATIONAL NICKNAMES.

UNCLE TOM'S CABIN. See STOWE, HARRIET BEECHER.

UNCOMMERCIAL TRAVELLER, THE. A series of papers written by Charles Dickens for *All the Year Round*, from Jan. 28 to Oct. 13, 1860. Eleven new sketches were added in the edition of 1868 and seven in 1869.

UNCONFORMITY. A term applied in geology to a break or interruption in the sequence of rock formations. In areas of stratified rocks one series may be found sometimes to rest upon the upturned or eroded edges of another series, thus showing that the deposition of the inferior beds was followed by an upheaval, during which they were disturbed from their horizontal position or were eroded, and then by a depression beneath the water, where the upper series was deposited. An unconformity, therefore, marks a hiatus in the geological record—a lapse of time unrecorded by sedimentation—and it is only by examining the sequence of deposits in other regions that the missing series can be supplied. See GEOLOGY.

UNCONSCIOUS, THE. An hypothesis of the school of psychology of Dr. S. Freud (q.v.), used

originally to explain and cure various types of maladies of mental origin. (See PSYCHOTHERAPY.) This doctrine of the unconscious, which is radically different from the conception of the older psychology given under subconscious (q.v.), was first published in 1893. It is also essentially different from the unconscious will of Schopenhauer (q.v.) or of Hartmann (q.v.). The conscious life of man, varying in intensity from the maximum clearness at the focus of attention to the marginal states (sounds, sights, etc., faintly heard and partially attended to, including ideas and imaginations), is grounded, according to the Freudian school, upon the unconscious, which never, as such, enters consciousness, but which plays an important part in the mental life by directing or conditioning the choice of ideas that shall enter consciousness.

The unconscious is an instinctive or impelling force or desire and does not reason or think in conscious modes. Its emergences into consciousness take the form of expressions of desire mostly so elemental and gross as to be unacceptable to modern social life. So there is assumed a transforming and distorting agency that stands at the threshold of consciousness and rehabilitates or disguises the expressions of desire so that they shall not offend the moral sense of the conscious life. This agency Freud calls the Censor. "The unconscious idea is one which *cannot* penetrate consciousness no matter how powerful it may become; and one which we do not perceive but whose existence we concede because of other signs and proofs" (Freud)—somewhat analogous to the astronomers' inferring the existence of an invisible body from the aberrations of the planets that are visible. Beside the unconscious and standing below the conscious is the state of those mental processes which, like the multiplication table, may be called into consciousness at will. Freud has called this state the *foreconscious*. Substantial practical results, shown in the cure of mental and other diseases, have justified the assumption of the impelling force of the unconscious, which force is called the *libido* or desire.

Concrete illustrations of the effects of the unconscious in everyday normal life are everywhere observable. The forgetting of names is explained by the desire to avoid letting them come into consciousness, because unpleasant experiences associated with them might be recalled; forgetting to post a letter containing a check may be caused by unconscious desire not to let go of the money. Freud relates (in his *Interpretation of Dreams*) that although intending to visit an old and uninteresting woman he found himself before the door of a very much more attractive person, and explains his absent-minded action by the fact that his unconscious desired to visit the attractive person while his conscious interest would have led him to his aged patient. The effect of the power of the unconscious is most strikingly noticeable in its work upon the dreams of all persons. The interpretation of dreams according to psychoanalysis, as Freud has termed his method, is the most important feature of the Freudian psychology. (See DREAMING; FREUD, S.; HYSTERIA.) The unconscious is represented as being conditioned to a large degree by heredity and as a type of blind desire recapitulating the evolution of the mental life of the race. (See RECAPITULATION THEORY.) The *libido*, or primal psychic desire, as it is ontogenetically developed, strives to satisfy it.

self, first with respiratory, nutritive, and eliminative activities (in the new-born infant), then with investigations into the various parts of its body (the so-called auto-erotic stage), as a concrete example of which is mentioned the thumbsucking of children, in many cases carried on for many years; then in a general magnifying of interest in the ego as a whole (the Narcissistic period), and finally at the age of puberty in normal humans, in the development of true sexual love which is transferred from self (unless retarded or obstructed) to its object in the opposite sex, the true mate. A fundamental type of the unconscious mental life which Freud believes to exist in every human he has termed the "Œdipus complex." This implies not that every man wishes to kill his father and marry his mother, a misconception which has caused much criticism of Freud's theories, but that in the usual life of the child his first object of affection is obviously his mother and he instinctively regards his father as his rival. The manner in which any given individual has unconsciously worked out the relations of this Œdipus complex is looked upon as a measure of his progress towards a truly adult social life. Most psychoneurotics and many apparently normal persons are shown, by the latent content of their dreams, to have been unsuccessful in the practical working out of this Œdipus complex in a way which will enable them to perform to the utmost of their abilities their work in human society. Of this maladaptation to the requirements of life one is painfully aware when he has suffered in some way by the lack of harmony, the conflict in his psyche, as it is called. His unconscious having been analyzed by the method of psychoanalysis, the realization of the maladjustment to environment leads the individual to a conscious endeavor towards a reform which is essentially ethical; and it is believed by the Freudians that the harmony with the ideals of civilization thus attained is the cause of the amelioration or cure of the malady.

The effect of the unconscious is seen by the Freudians not only in the individual but in the race, being shown in all works of imagination, all religious and social movements, such as alchemy, Rosicrucianism, Freemasonry, etc., and in poems and other works of art and in myths. An extensive study has been made in the subject of myth formation as governed by unconscious psychic processes, and a similarity noted between myths and dreams. One author (Abraham) calls the myth the dream of the nation and the dream the myth of the individual.

The details of the Freudian view of the unconscious are admittedly only a working hypothesis, and as such, like every scientific theory, are subject to constant development at the hands of scientists, among whom are a large number of psychiatrists in Europe and America. The conflict between this theory and the regular academic experimental psychology is more apparent than real, as the Freudians do not wish to say that there is such a thing as unconscious conscious states, an implication that will naturally be attributed to them. They merely posit a force, imperceptible as such, but the effects of which, seen in the various phenomena of hypnotism, etc., are not explainable on any hitherto appearing hypothesis. The effects of this force have, however, quite practical results in human conduct, and are quite workable for the understanding of psychic manifestations

and for the conscious evolution of psychic life. Consult: S. Freud, *Interpretation of Dreams* (New York, 1913); O. Pfister, *Die Psychanalytische Methode* (Leipzig, 1913); H. Silberer, *Probleme der Mystik und ihrer Symbolik* (Vienna, 1914); Morton Prince, *The Unconscious* (New York, 1914); C. G. Jung, *Psychology of the Unconscious* (ib., 1916).

UNCONSCIOUS CEREBRATION. See CEREBRATION, UNCONSCIOUS; DETERMINING TENDENCY; SUBCONSCIOUS.

UNCTION (Lat. *unctio*, an anointing, from *ungere*, to anoint). The practice of anointing the body, or certain portions of the body, with oil. It was resorted to by the ancients from motives of health, of athletic development, or of luxury; but the practice now is chiefly a religious one. It was a rite in frequent use among the Egyptians, as well as the Greeks and Romans. Among the Hebrews priests and kings were anointed upon being set apart for their several offices, as were also sacred vessels. In Christian use, anointing in sickness was common from a very early time. (See **EXTREME UNCTION**.) Besides the anointing of the sick, however, there were many other sacred unctions in ancient Christian practice; viz., in baptism, confirmation, ordination, consecration of churches, and the coronation of kings.

UNDERGROUND RAILROAD. The name popularly applied before the Civil War to the system of aiding fugitive slaves to escape from their masters and elude pursuit. By furnishing food and shelter as well as advice to fugitives, northern abolitionists enabled thousands to escape to Canada beyond the reach of the Fugitive Slave Law. The most favored routes lay through Ohio and Pennsylvania. Houses along them came to be known as stations; those who directly assisted the escaping fugitives were known as conductors; and those who made contributions of money, clothing, etc., were known as stockholders in the enterprise. Many negroes in Canada made trips to the South to assist their friends in escaping from slavery. Rewards were offered by Southern legislatures and individuals for the delivery of such persons south of Mason and Dixon's line. Among the most active white persons in the underground-railway service were Levi Coffin, Josiah Grinnell, Gerrit Smith, Theodore Parker, Thomas Garrett, Rev. Charles Torrey, and Samuel J. May. Coffin was commonly styled the president of the concern, and he claimed to have been actively engaged in the business for 33 years and to have received into his house an average of 100 fugitives annually. The historian Rhodes observes that the chief historical importance of the Underground Railroad lay in its manifestation of popular sentiment. Many of those concerned in this service were fined heavily for violating the Fugitive Slave Law, Garrett alone paying a fine of \$8000; but occasional punishments inflicted did not break up the practice, and it continued to be one of the chief grievances of the South against the North. Consult W. H. Siebert, *The Underground Railroad from Slavery to Freedom* (New York, 1899).

UNDERGROUND RAILWAY. See RAILWAYS; TUNNEL; URBAN TRANSPORTATION.

UNDERHILL, JOHN (17-1872). An American colonist, born in Warwickshire, England. In his youth he saw military service in the Low Countries and Spain, and in 1630 he accompanied the elder John Winthrop to Boston. Four

years after his arrival he was elected to the Colonial Assembly, and in 1637 he aided Capt. John Mason (q.v.) to exterminate the Pequot Indians. Of this expedition he wrote an account entitled *News from America*, which was published in London the following year. In spite of the services thus rendered he incurred the wrath of the colonists by espousing the Antinomianism of Wheelwright and by his immorality. Leaving Massachusetts, he took refuge at Dover in New Hampshire, and was there elected Governor. Later he removed to Connecticut and became a member of the Assembly. In 1643 he entered the military service of the New Netherlands, but 10 years later he was expelled and went to Rhode Island, where he obtained a commission to make war on his late employers. In 1664 the New Netherlands were conquered by the English, and Underhill returned and settled at Oyster Bay, where in 1667 he obtained a grant of 150 acres of land from the Mantinenc Indians. On this property, which he named Killingworth, he passed his later years.

UNDERLEASE. The creation of a new term by a lessee of lands, by alienation of a portion of or an interest in his own term, with a reversion in himself. Where a lease is silent on the question a lessee may make a valid underlease, so long as the conditions in the original lease are observed, and it is therefore customary to include in the lease a covenant against subletting or assignment by the lessee, without the consent of the landlord. See **LANDLORD AND TENANT**, and consult the authorities there referred to; **LEASE**.

UNDERSTANDING. A term which has been employed in various philosophical systems, from Plato to Hegel, as in some sort antithetical to reason. In general, the point of distinction has been that reason is the higher, understanding the lower faculty of cognition; that reason apprehends intuitively and in wholes, understanding discursively, on the ground of premises and hypotheses which it does not itself test; that reason moves above the realm of sense, while understanding is indebted for its material to the empirical data of sensation. In the modern psychological system reason and understanding have either dropped out of use or at least have come to play a very subordinate part. See **KNOWLEDGE**. Consult: J. Sully, *The Human Mind* (2 vols., New York, 1892); William James, *Principles of Psychology* (new ed., 2 vols., ib., 1905); W. Wundt, *Physiologische Psychologie* (6th ed., Leipzig, 1910-11).

UNDERTONES. See **HARMONICS**.

UNDERWING MOTH. Any noctuid moth of the subfamily Catocalinae, and especially one of the type genus *Catocala*, of which more than 125 species inhabit the United States. Many have beautifully colored hind wings, which, however, are entirely concealed by the others when they are at rest. They are night fliers, and generally pass the day upon trunks or branches of trees which they closely resemble in coloring. The larvæ are inconspicuous, and are usually protectively colored, and curious lateral structures have been developed for the purpose of disguising the resting line between the larva and the surface upon which it stands. Some of them have developed bright warning colors in spots which may be exhibited at the will of the larva.

UNDERWOOD, LUCIEN MARCUS (1853-

1907). An American botanist, born at New Woodstock, N. Y. He graduated at Syracuse University in 1877. He was professor of botany and geology at Illinois Wesleyan (1880-83), professor of botany at Syracuse (1883-91), and De Pauw (1891-95), and in 1896 became professor of botany at Columbia. He committed suicide. He published: *Our Native Ferns and how to Study them* (1881; rev. in 1882 as *Our Native Ferns and their Allies*, 5th ed., 1900); *Descriptive Catalogue of North American Hepaticæ* (1884); *An Illustrative Century of Fungi* (1889); *Hepaticæ Americane* (1887-93); *Moulds, Mildews, and Mushrooms* (1889). His *Underwood Families of America* was edited by H. J. Bonker in 1913.

UNDERWOOD, OSCAR WILDER (1862-). An American legislator, born at Louisville, Ky. He was educated in law at the University of Virginia, and settled at Birmingham, Ala., being admitted to the bar in 1884. In 1892 he was made chairman of the Democratic district executive committee, and in 1894 he was elected Representative in Congress, but his seat was successfully contested by Truman H. Aldrich. He was reelected in 1896 and served continuously until 1915. In Congress, Underwood became one of the most prominent debaters and parliamentary leaders of his party and its chief expert in tariff legislation. Although the representative of a manufacturing and mining district, he stood consistently for a revenue tariff. In 1910 he cooperated with Champ Clark as a leader of the Democrats in reducing the powers of Speaker Cannon (q.v.). In 1911 he was made chairman of the Ways and Means Committee and majority leader of the Democratic party in the House. He is supposed to have been the author of the great reform in procedure whereby committee members were to be elected by the House on nomination of the Committee on Ways and Means. Underwood led the fight for Canadian reciprocity and was the framer of the series of tariff measures revising separately various schedules of the Payne-Aldrich Law, such as the Farmers' Free List Bill, the Wool Bill, Cotton Bill, Steel Bill, and a bill changing the chemical schedule, which were vetoed by President Taft. His skill in leadership brought him wide notice, so that as a candidate for the presidential nomination at the Baltimore Convention in 1912 he ranked third, receiving at one time 130 votes. Afterward he was, in general, a supporter of President Wilson, although he opposed the repeal of the Panama Canal Tolls Exemption Act. In 1913 he was largely responsible for the important Underwood-Simmons Tariff Act (see **TARIFF**). In 1914 he was elected United States Senator, having defeated Richmond P. Hobson (q.v.) in the primary election by more than 20,000 votes. See **UNITED STATES, History**.

UNDERWRITER. In ordinary usage, a person who is authorized to negotiate insurance contracts. In modern financial practice a peculiar form of insurance has arisen to which the term "underwriting" is applied. It has been resorted to for many years in marketing new securities for established corporations, but has reached its highest development in the financing of the large industrial corporations recently formed. When a large corporation is organized to absorb a number of existing companies it is usually necessary to raise a large sum of money to serve as a working capital or to be employed

in the purchase of stock in the original companies which holders are unwilling to exchange for new securities. To raise this cash the services of an underwriter are usually secured. The underwriting contract is one by which the company is assured of a definite amount of capital within a stated time. The underwriter binds himself to take at some stated future time a stipulated part of the securities of the new company at a price named in the contract, unless such a part is sold before that time at as high a price. He usually further agrees to advance at once the capital needed to launch the company. The underwriter leaves a wide margin between the price at which he agrees to take the stock and the price at which he hopes to sell it. A part of his reward comes from this source. He sometimes exacts in addition a bonus of stock for himself, or a commission on all stock sold, and occasionally stipulates that none of the stock given to others shall be put on the market until he has disposed of the entire amount that he has underwritten.

The securities of a corporation of any magnitude are seldom underwritten by a single person or firm. The original underwriter usually allows other bankers or favored customers to share in the underwriting. The group is known as an underwriting syndicate. The original underwriter usually acts as syndicate manager. Each member of the syndicate subscribes for a part of the stock. The cash that has to be raised to carry out the agreement with the company is secured by the syndicate manager partly through an assessment pro rata upon the members of the syndicate, partly by borrowing on the security of the underwriting. At the expiration of the time limit the syndicate manager distributes the profit of the transaction pro rata among the members, if the specified amount of stock has been sold. If some of it still remains unsold, whatever profit has been realized is distributed, and each member of the syndicate is called upon to take his proportionate share of the unsold stock at the stipulated price.

UNDERWRITING, MARINE. See SHIPS AND SHIPPING, *Classification for Marine Insurance*.

UNDERWRITING OF SECURITIES. See RAILWAYS.

UNDINES, ün-dénz' (ML. *undina*, from Lat. *unda*, wave). The name given in the fanciful system of the Paracelsists to the elementary spirits of the water. Paracelsus describes the Undines in his *Treatise on Elemental Spirits*. They are of the female sex. This order of elementary spirits intermarries most readily with human beings, and the Undine who bears a child by such union receives with her babe a human soul. But the man who marries her must be careful not to go on the water with her, or at least not to anger her there, for she will return to her original element. Should this happen, the Undine will seek to destroy her husband should he venture on a second marriage. Fouqué has made this Paracelsist fancy the basis of an exquisite tale entitled *Undine*, published in 1811 and frequently translated into English.

UNDUE INFLUENCE. In law, such an influence or control exercised over the mind of a testator that his will is practically overpowered, and that he is constrained by it to make some disposition of his property by will contrary to his own best judgment and wishes. Mere per-

suasion, appeals to the charity, benevolence, affections, gratitude, or pride of a testator will not constitute undue influence, unless carried to such an extent that the mind of the testator is virtually overpowered. For example, one of several children may suggest to one of their parents that the latter should bequeath to him a larger share of his property than to the others, and urge as a reason that he labors under some disability rendering him less able to support himself than the others, or that the others have been abundantly provided for by bequests or devises from other relatives, etc. Where a will is contested on the ground of undue influence, the courts will scrutinize very carefully the relationship which existed between the testator and the beneficiary, and if it was of a confidential or fiduciary character, as that of attorney and client, physician and patient, religious confessor and confessant, such a fact is regarded as a suspicious circumstance, which, taken in conjunction with proof of active efforts on the part of the beneficiary to induce the testator to make his will in favor of the former, may give rise to a presumption of undue influence. Ordinarily, however, where undue influence is charged, the burden of proof rests upon the party making it. Any person who would have been a legal heir if the testator had died intestate may contest his will on the ground of undue influence, and if he is successful the court will refuse to probate the will. See WILL, and consult the authorities there referred to.

UNDULANT FEVER. See MALTA FEVER.

UNDULATORY THEORY OF LIGHT. See LIGHT.

UNEARNED INCREMENT. The extent to which the value of real property increases independently of any expenditure of labor or capital upon it by its possessor. See the article SINGLE TAX.

UNEMPLOYMENT. A term applied to that condition of industrial life in which there is a considerable number of workmen out of work. In its widest application it describes the condition of several classes. In a report by the Labor Department of the English Board of Trade in 1893 the term is used of four distinct classes: (1) those who, engagements being for short periods, have terminated their last engagement on the conclusion of a job, and have not entered on another; (2) those who belong to trades in which the volume of work fluctuates, and who, though they may obtain a full share each year of the work afforded by their industry, are not at the given time able to get employment at their trade; (3) those who are economically suffering because there is not enough work in those trades to furnish a fair amount to all who try to earn a livelihood at them; (4) those who cannot get work because they are below trade standards of efficiency, or because their personal defects debar them. Another classification divides the unemployed into three classes: (1) members of season trades; (2) members of decaying trades; (3) the "fringe" or least competent members of every trade. These are broad definitions, including two separate groups, those who for one reason or another, as feebleness, illness, old age, criminal characteristics, or mental deficiency, are incapable; and, secondly, those able and willing but unable to find work. The first class has always existed, and its presence occasions different phases of the problems of poverty and pauperism. The existence of the

second class constitutes more strictly the problem of unemployment. Irregularity of employment even for competent workmen is not a modern phenomenon. It has been characteristic of every stage of economic development; but, from the growth of industrial democracy and the development of humanitarian interest, the evil assumes new importance.

The immediate causes of unemployment are many. Chief among them are: (1) fluctuations due to change of season, as in the building trades, in dock labor in London, or in the tea, wool, and timber industries; (2) introduction of new machinery and transformation of processes; (3) migration of labor from rural districts to the city, or from one country to another; (4) displacement of adult males by women or children; (5) shifting of the seat of an industry from one place to another; (6) change in fashion; (7) industrial depression or the operation of some extraordinary occurrence, as war. Some of these causes have been in operation with increasing force since the revolutionary inventions of the eighteenth century, and the introduction of new methods of transportation in the first half of the nineteenth century. The influence of the causes mentioned has been accentuated during the past century by the periodic appearance of crises which profoundly affect the entire organization of trade and industry. Under international competition markets become more sensitive to remote disturbances; production may cease, and entire classes of workmen for weeks together be thrown out of work. In addition to these clearly recognizable causes, various theories, involving a discussion of the fundamental principles of political economy, have been advanced to explain the phenomena of unemployment. Only a reference can be made to these. First, the theory of overproduction: under the present system of production, with its enormous capacity for manufacture, more goods are created than are required for market needs; consequently there must be cessation at regular intervals until the excess supply has been taken up. Second, the theory of underconsumption: the rich hoard and invest too much in fixed capital, while the poor have not the power of wholesome consumption. Third, the theory of inflated credit: the extensive organization of business, the promotion of new enterprises, the growth of banking institutions for the sale of credit have all stimulated the growth of the credit system; the settlement of contracts is thus made contingent upon future success; this development goes beyond the limits of safety, and periodically necessitates contraction; this depresses industry, and men are out of work. Fourth, the Socialist theory, which attributes unemployment to the institution of private property and the practice of individual competition: these necessarily cause a never-ending fluctuation of supply and demand, and prevent a harmony of industrial interests.

Statistics of unemployment are far from satisfactory. To determine the amount of unemployment statistics should show the number and proportion of those out of work on a particular day and also the duration of unemployment for each workman during the year. Popular estimates of unemployment are greatly exaggerated, owing to the inclusion of the shiftless and chronic paupers. A true estimation of the significance of unemployment can be secured only by a classification of statistics by cause of unemployment:

whether due to seasonal fluctuations peculiar to a trade, to inability to find work in consequence of an industrial depression, to personal characteristics which place a man in the class of unemployables, or to sickness or disability. The principal sources of unemployment statistics are: returns from trade unions, statistics of men employed in manufacturing establishments at different seasons; census statistics of the unoccupied; special investigations or censuses of particular cities, or groups of workmen; records of distress committees, especially in England since 1905; records of employment bureaus; and statistics secured in connection with unemployment insurance benefits.

Trade-union returns were earliest developed, and give fairly reliable data of the amount of unemployment among their members. Returns of trade unions are published, e.g., by the Labor Department of Great Britain in the *Labor Gazette* and in the *Annual Abstract of Labor Statistics*, beginning with 1887; by the Labor Department of France since 1894, and of Belgium since 1895. German figures on unemployment are published in the *Reichsarbeitsblatt* and in the *Arbeitsmarkt*. In the United States, the Bureau of Labor of New York publishes in its quarterly bulletin returns from trade unions (since 1897), and the Massachusetts Bureau since 1905; the American Federation of Labor gives a monthly report of unemployment in the *American Federationist*. These records are limited as a rule to well-organized trades. The English trade-union returns published by the Labor Department of the Board of Trade cover 650,000 unionists, about one-third of the total members of trade unions, and one-twelfth of the total industrial manual workers. The proportion of union workmen out of work to the total membership (minus those who were sick, on strike, etc.) varied from 1894 to 1908 between 2.4 per cent and 6.9 as an average for the year. The seasonal fluctuation of some trades is clearly revealed by the figures. The percentage in the building trades (carpenters and plumbers) varied from 3.3 in August to 5.9 in December; in the furnishing trades from 7.9 in January to 2.4 in April. No definite conclusion as to unemployment among all industrial workers can be drawn from these figures; they include too great a proportion of skilled workmen, and of the skilled workmen those in the engineering and building trades are more than proportionately represented.

Statistics for unemployment are not as well developed in the United States as in Europe. Trade-union returns for selected industries in New York State indicate a percentage varying from 10 to 37 per cent for different seasons and for different years; in 1910 the lowest percentage was 12.5 in September and the highest was 24.5 in January. In 1902 for May the figure was 14 per cent; in 1903, for the same month, 20; 1904, 27.1; in 1905 it fell to less than 10; in 1910 it was 14.5 and, in 1911, 27.2. These figures are reported by the secretaries of the trade unions and cover a membership of approximately 100,000. No careful discrimination is made in these returns between those out of work because they cannot find employment—the real unemployed—and the sick, disabled, etc.; and in this respect they are much inferior to English statistics. Figures for all unions in the State, including 450,000 men, giving the number idle on the last day of the quarter show

a somewhat smaller percentage of idleness than for the selected unions. Further the percentage idle throughout the quarter for all unions for July to September varied from 1.9 in 1903 to 12.8 in 1908; for the first quarter from 5.5 in 1903 to 26.3 in 1908. Returns for trade unions in Massachusetts indicate a smaller proportion of trade-union members out of work than those for New York; the extremes of variation for unemployment at the end of each quarter from 1908 to 1911 being from 17.9 to 4.8 per cent. Perhaps the higher proportion returned in New York may be due to the greater relative weight of the building and clothing trades in the New York data—industries in which unemployment and seasonal fluctuation are very considerable. The reports of the *American Federationist* indicate a low degree of unemployment. In 1908, a year of depression, the percentage varied from 4.1 to 9.6; the percentage for the preceding year varied from 0.2 to 5.8 for the different months. These figures seem more comparable to the English returns.

The statistics from manufacturers as to numbers employed in different months afford an indication of the seasonal fluctuation of unemployment. The figures for the Federal Census of 1905 showed a maximum number employed of 5,678,000 in October; the minimum, 5,263,000, fell in January; the difference indicates that 7.3 per cent fewer men were employed in January than in October. The figures do not indicate the proportion unemployed in the latter month, nor do they take into account the possibility that those not employed in manufacture in January may be able to find work in other lines.

The statistics of the Federal Census on unemployment are unsatisfactory and unreliable. In 1900, 22.3 per cent of the occupied over 10 years were returned as unoccupied for some part of the census year. About one-half of those reported idle were unoccupied for three months or less, and four-fifths of the rest were unemployed for a period of four to six months. These figures throw no light as to the cause of idleness, whether sickness, disability, whether from choice or from inability to secure work. They cover all persons 10 years of age and over who report a regular occupation, and probably include many children attending school who are employed a part of the year.

Special investigations throw more light on the subject. A special police census, e.g., was taken in Rhode Island in March, 1908, to determine the number unemployed on account of the industrial depression then prevailing. The five principal cities with about two-thirds of the wage earners of the State were canvassed: 7.8 per cent of the estimated number of wage earners in these cities were found to be unemployed, and 18,292 for the entire State. These figures were corroborated by returns from manufacturers indicating for Feb. 28, 1908, a decrease of 19,000 employed from the figure for 1907. This census did not take any account of men working on short time, and it was alleged that men employed for a few hours a day on charity work were included among the employed.

Much information on the numbers of those seeking work can be obtained from statistics of labor exchanges. Nineteen states and a number of municipalities have established labor exchanges furnishing free service in bringing employer and the seeker after work together. Statistics of these offices are not statistics of

the unemployed alone; they are rather statistics of the labor market—i.e., of the offer and demand for labor, for a certain percentage of those who register have positions and file applications simply in the desire to change. Further information of a fragmentary sort can be obtained from the records of public poor departments and charitable societies, especially where a record is kept of the cause of destitution. Care must be taken to distinguish between the new applications and the total number, in order to avoid duplication. More complete data on unemployment and especially its extent will be secured by the insurance funds which have been established in England in connection with compulsory unemployment insurance of workmen in certain construction and engineering trades.

The remedies proposed for the relief of unemployed are of two kinds, those applicable in times of emergency and those which are permanent in their operation. In the administration of emergency relief difficulties are met, for it is easy to transmute unemployment into voluntary idleness. Discrimination must be shown, first, in the selection of the persons to whom relief work is to be given; second, in the choice of work to be undertaken; and, third, in the organization of the agencies by which relief work is to be administered. It is difficult to separate the worthy from the unworthy, and to prevent the influx of the unemployed from outside districts. Abuses occasioned by lax methods are well illustrated by the soup kitchens and bread carts in American cities in 1873, and by the indiscriminate distribution of the Mansion House Fund in London in 1886. Efforts were made to develop a wiser policy in the relief work of each country in 1894. It is now generally agreed that emergency funds as far as possible should be restricted to those who in ordinary times are habitually at work, to those personally known, and to those who are willing to accept less wages than customary, or to work fewer hours per day or fewer days per week, so as to prevent refusal to work elsewhere under ordinary conditions. In brief, there must be investigation and some sort of test. The principles adopted by the Local Government Board of England in 1893 in the selection of work were as follows: (1) work which does not involve the stigma of pauperism; (2) work which all can perform, whatever their previous vocations; (3) work which does not compete with that of other laborers at present in employment; and (4) work which is not likely to interfere with the resumption of regular employment in their own trade by those who seek it. In accordance with the foregoing principles, municipalities were advised to undertake spade industry on sewage farms, the laying out of open spaces, recreation grounds, and new cemeteries, the cleansing of streets not usually undertaken by local authorities, the laying out and paving of new streets, and the extension of sewerage work and works of water supply. These forms of work, however, do not meet the needs of all—the experience of cities and towns in the United States in 1894 showed that many mill hands and artisans were physically unable to endure out-of-door work in the winter or during inclement weather—and, of course, women are not provided for.

The agencies to relieve distress among the unemployed are of five classes: first, special citizens' relief committees, organized primarily to

aid the unemployed; second, municipal departments having charge of public works upon which it is possible to give employment; third, labor organizations giving aid either by the usual out-of-work benefits or by extraordinary methods; fourth, private charities, including all permanent relief-giving organizations not connected with State or municipal governments; fifth, the permanently established relief agencies administered for the State and for municipalities, such as poor departments. No one of these agencies is complete in itself. The organization of a special relief committee is too apt to be delayed until suffering has been acute, and its methods are likely to be ill-considered if not injurious to society. The undertaking of new public works by municipalities is liable, in the present stage of political development, to be uneconomical, and possibly demoralizing to the civil service. Its virtue is that it may have less of the demoralizing taint of charity. Trade unions cannot make work, and generally oppose any reduction in the standard rates of wages in fear that they cannot recover the concession except by prolonged struggle. Nor do they possess adequate funds to meet extraordinary demand. Private charities are hampered by the cautious, and to able-bodied workmen often irritating, methods of investigation which must govern the ordinary administration of charity. Illustration of the work of all these agencies may be found in great detail in the *Report of the Massachusetts Board to Investigate the Subject of the Unemployed*, made in 1895, and in the *Report on the Agencies and Methods for Dealing with the Unemployed*, made by the Labor Department of the Board of Trade of Great Britain, in 1893.

The more permanent agencies which have been recommended for the relief of unemployment are as follows: (1) Publication at frequent intervals by responsible authorities, either trade or governmental, of the condition of the labor market, for the purpose of assisting workmen who seek employment, and of preventing an excessive migration from the country into the city. (2) The establishment of employment bureaus and registry offices in order to bring employers and laborers together more promptly. Neither of these agencies can greatly increase the amount of work to be performed; they do, however, reduce loss of time and futile effort. (3) Establishment of boards of conciliation and arbitration in order to prevent strikes and lock-outs, which throw men out of work. (4) Adoption of a shorter day of work, so as to give opportunity of employment to a greater number of workmen. This recommendation, however, does not take into account the results of past experience; either the productive power of those working is proportionately increased by the reduction in hours, or the cost of production is increased, thus diminishing the purchasing power and standard of comfort of those dependent upon that particular product. (5) Restriction of immigration. In some industries, as the garment-making trade in the cities of the Atlantic seaboard, and the mining industry in Pennsylvania and Illinois, there has undoubtedly been a congestion of labor owing to an excessive influx of workmen from foreign countries; the restriction of immigration, however, involves so many consequences entirely apart from that of regularity of employment that its discussion must be omitted. (6) Establishment of labor

farms or colonies for the purpose of training workmen for agricultural life. The most notable of these experiments are the Labor Colonies of Germany; that of Hadleigh, in England, established by the Salvation Army; the Jewish colonies in Alliance and Woodbine, New Jersey; and certain land settlements in New Zealand. Nearly every country has experimented along this line, but the results are not as a whole encouraging. It is undoubtedly one of the methods to be utilized, but it appears to be unfitted to serve as a complete remedy. Agricultural labor is not highly paid, and during the past half century has been subjected to enormous strains caused by the opening of new markets of supply. Nor can it be expected that a miscellaneous collection of workmen taken from the city will succeed in entirely new pursuits upon the land. Again, urban workmen who have been unused to farm life are likely to be attracted by numerous associations to the charm of city residence. Success can be hoped for only when the colonists are inspired by an earnest spirit, can settle upon land of especially favorable quality, and are supplied with a considerable amount of initial capital. (7) Insurance against unemployment. Many municipalities in Europe have adopted the so-called Ghent system of insurance against unemployment, which consists in subsidizing trade unions giving unemployment benefits to their members. All responsibility for establishing the fact of unemployment and controlling the distribution of the benefits is placed in this system upon the union. Approximately a quarter of a million workers in various cities are insured. Great Britain enacted in 1911 a law requiring compulsory insurance in construction and engineering trades, covering about 2,500,000 workmen. Up to the outbreak of the great war, the insurance fund had been able to meet all demands for unemployment benefits and had a considerable surplus to its credit. Contributions are required both from workman and employer, and the state adds a subsidy equal to one-third of these contributions. (See *SOCIAL INSURANCE*.) (8) The extension of state industrial enterprise. This in particular is the remedy offered by the Socialists. (See *SOCIALISM*.) (9) Industrial education. Opposed to the Socialist is the individualist who lays stress upon individual training by which the workman will be enabled to turn quickly from one employment to another in case of displacement. It is held that industrial evolution has proceeded at so marvelous a rate that it is impossible to avoid disturbance. Distress can best be met by a thorough preparation of the individual and the adoption of such measures as will tend to strengthen individual effort and to widen individual opportunity. Consult: W. H. Beveridge, *Unemployment: A Problem of Industry* (London, 1909); S. and B. Webb, *Minority Report of the Poor Law Commission* (ib., 1900); F. B. Sargent, "Statistics of Unemployment and Work of Employment Officers," in *United States Bureau of Labor, Bulletin No. 109* (Washington, 1913); "The Struggle against Unemployment: Symposium," in *American Labor Legislation Review*, vol. iv (New York, 1914), including bibliography. See *LABOR COLONIES*.

UNGAVA, ūn-gā'vā or ūn-gū'vā. A territory of Canada. In May, 1912, an act of the Canadian Parliament authorized its annexation to the Province of Quebec, and the same year it was

erected into the Territory of New Quebec by an act of the Legislature of the Province of Quebec (Map: Canada, Q, R 5). New Quebec has an approximate area of 351,780 square miles. The population, including Labrador, consists of about 3500 Indians, 2000 Eskimo, and 8800 whites. The population is expressly excluded by law for the purposes of readjustment of representation of the provinces of Canada. It occupies, for the main part, a table-land having an average elevation of 1000 to 2000 feet, and composed almost wholly of Archean gneisses and granites, with some ancient Paleozoic, mainly Silurian, sedimentary rocks. In the northwest the land sinks to an altitude of 500 feet, while the shores of Ungava Bay, as well as portions of the Hudson Bay coast, are lower. At Cape Jones, at the entrance to James Bay, and at several other places the plateau approaches the coast. The surface of the plateau is an undulating plain scoured by glacial action, so that the rounded granite surfaces are exposed, surrounded by marshy depressions. Post-glacial river systems have not yet developed definitely, and the interior is a maze of surface streams and shallow lakes, the latter being so numerous that fully one-third of the total area is covered with water. The streams finally collect in a number of main rivers, which have cut deep valleys in the edge of the plateau, through which they descend to the coast by falls and rapids. These rivers have an enormous water power, that of Hamilton River being estimated at 300,000 horse power. About 90 per cent of the forests of New Quebec are spruce, which is supplemented by canoe birch, aspen, cedar, cypress, and poplar. Large forests of spruce and birch extend northward in the valleys as far as the fifty-seventh parallel, north of which the country is treeless, though there is an area of scrub where gooseberries, currants, huckleberries, and cranberries are abundant. The vegetation in the northern half consists of sphagnum bogs with sedges and Arctic flowering plants, followed in the extreme north by tundras, in which lichens, especially reindeer moss, are predominant. The sable is the most valuable of the fur-bearing animals, though ermine, lynx, beaver, and foxes are numerous. Overhunting has nearly exterminated the caribou—especially the woodland species. The shore fisheries along the coast of Hudson Bay are considered as the most productive of the natural resources of the Territory in the immediate future. Trout, whitefish, cod, and salmon are the most important fish. Immense deposits of magnetite, hematite, and siderite in the Cambrian formation are widespread, and promise to be of future economic importance. Carbonate iron ores, with large percentages of manganese, are found in great quantities in the Hudson Bay region, both along the coast and also on all the Hopewell islands, on part of the Nastapoka and adjoining groups. The climate is rigorous, but varies greatly in the 800 miles of latitude. In general the winters are colder and the summers warmer than on the Labrador coast. While minimum winter temperatures varying from -40° to -55° occur, there are large interior areas where the summer temperatures rise above 80° each year. Snow falls to the depth of 3 to 5 feet annually. Consult *Reports on Ungava, recently Added to the Province of Quebec, under the Name of New Quebec* (Department of Colonization, etc., Province of Quebec, 2d ed., Quebec, 1915).

UNGER, ung'ér, CARL RICHARD (1817-97). A Norwegian philologist, born in Christiania. He was educated at Christiania University, where he was lecturer (1845-62), and professor from 1862 to his death. He became known through his accurate and discerning work in editing numerous Old Norse and Icelandic texts, first together with P. A. Munch and R. Keyser, later alone. Among them are *Heimskringla*, by Snorri Sturluson, *Olafs saga*, *Marckskinna*, *Konungs skugg-sjá*, mediæval romances, legends, and homilies. He also edited the monumental work *Diplomatarium Norvegicum* (vols. i-v, 1847-61, with C. A. Lange, and vols. vi-xv, 1863-1900, with H. J. Huitfeldt-Kaas).

UNGER, ung'ér, FRANZ (1800-70). An Austrian botanist, born in Styria. In 1836 he became professor of botany at Graz and in 1850 was called to Vienna. He was one of the pioneers in paleobotany, and also in ecology, a paper of his on the relation of soil to vegetation being one of the classics of ecology. He also did pioneer work in plant physiology.

UNGER, JOSEPH (1828-1913). An Austrian jurist and statesman. He was born in Vienna, studied law in that city, and after holding a chair at Prague was professor of jurisprudence in the University of Vienna from 1857 till his retirement many years later. He was greatly interested in the constitutional questions of Austria, and, in collaboration with Fischhof, published *Zur Lösung der ungarischen Frage* (1861). He became a member of the Lower Austrian Diet in 1867, and later of the Reichsrat, where he was active on behalf of the liberal programme. In 1869 he was called to the House of Peers. From 1871 to 1879 he was Minister without a portfolio, and in 1881 became the President of the Imperial Court. His chief work, an attempt to systematize the Austrian private law, was published under the title *System des österreichischen allgemeinen Privatrechts* (1856-59). Among his other works are: *Das österreichische Erbrecht* (1864); *Der Entwurf eines bürgerlichen Gesetzbuches für das Königreich Sachsen, mit besonderer Rücksicht auf das österreichische allgemeine bürgerliche Gesetzbuch besprochen* (1853); *Die rechtliche Natur der Inhaberpapiere* (1857); *Die Verlassenschaftsabhandlung in Oesterreich* (1865). With Glaser and others, he published *Sammlung von civilrechtlichen Entscheidungen des k. k. obersten Gerichtshofes in Wien* (1859-92).

UNGER, KAROLINE (1803-77). A Hungarian dramatic soprano, born at Stuhlweissenburg, near Budapest. She received her musical training from Aloysia Lange, Mozart's sister-in-law, and Johann Vogl, the great Schubert interpreter. Her début occurred at Vienna in 1821 in Mozart's *Così fan Tutte*. In 1824 she met Beethoven, who chose her to sing the solos in the first performances of his *Missa Solemnis* and *Ninth Symphony*. The scene of her greatest triumphs was Italy, where Mercadante, Pacini, Donizetti, and Bellini wrote many operas for her. At that time she wrote her name Ungher. After her marriage to a M. Sabatier in 1840, she retired from the stage, devoting herself entirely to the concert platform. She died in Florence. Her voice was powerful, but rather shrill in the highest register.

UNGER, ung'ér, WILLIAM (1837-). A German etcher. He was born in Hanover and was a pupil of Josef von Keller in Düsseldorf and of Thäler in Munich. In 1871 he became

professor at Weimar; in 1881 at the Kunstgewerbeschule, Vienna, and in 1895 at the Vienna Academy. He became the foremost champion of reproductive etching in Germany—indeed, in Europe—reproducing the great masterpieces of the galleries at Brunswick, Cassel, Haarlem, Amsterdam, and Vienna, with an elegance of draftsmanship, delicacy of execution, and richness of color that have rarely been equaled. His principal work is *Galerie des Wiener Belvedere*, with text by Lützow. Consult Graul, *William Unger und sein Radierwerk* (Vienna, 1891).

UNGNAD, ung'nät, ARTHUR FRANZ EDUARD (1879—). A German Orientalist, born at Magdeburg. He was educated at the University of Berlin (Ph.D., 1903); served as an assistant in the Royal Museum at Berlin in 1905–09; and thenceforth was professor at Jena. Besides grammars, his publications include: *Analogiebildungen im hebräischen Verben* (1903); *Syntax der Gesetze Hammurabis* (1903–04); *Selected Babylonian Business and Legal Documents of the Hammurabi Period* (1907); *Selected Business Documents of the Neo-Babylonian Period* (1908); *Hammurabis Gesetz* (1909–11), with Kohler; *Aramäische Papyrus aus Elephantine* (1911); *Praktische Einführung in die hebräische Lektüre des Alten Testaments* (1912).

UNGUENT (Lat. *unguentum*, from *ungere*, to anoint), or **ONTMENT**. A medicament for external application, consisting of a fatty base holding an active agent. The base consists of prepared lard, prepared suet, or olive or almond oil, mixed with white wax, or of vaseline, or of lanoline. The unguents of the *United States Pharmacopœia* are those of boric acid, tannic acid, rose water (cold cream), belladonna, chrysarobin, diachylon (lead plaster), nutgall, mercury, ammoniated mercury, nitrate of mercury, yellow oxide of mercury, red oxide of mercury, iodine, iodoform, carbolic acid, tar, potassium iodide, stramonium, sulphur, veratrine, zinc oxide, and zinc stearate. See **ONTMENT**.

UNGULATA (Lat. nom. pl., having claws or hoofs, from *ungula*, claw, hoof, dim. of *unguis*, Gk. *ὄνυξ*, *onyx*, nail, etc., Ofr. *inga*, nail).

An order of mammals including the elephants, hyracoids, hoofed animals, and related forms of the past; the ungulates. The earliest-known forms from the basal Eocene have many resemblances to the earliest Creodonta or primitive Carnivora, in the small brain,

in the development of a true herbivorous type of molar teeth, and in a type of limb adapted to running in the forests and on the plains. Some of the oldest forms have the foot semiplantigrade, but the change through the digitigrade to the unguligrade foot, with only the terminal phalanx resting on the ground, occurs during the early part of the Tertiary period. Also in the earliest forms all the five digits

EVOLUTION OF THE FOOT IN UNGULATES.

1, *Homalodontoherium* (Lower Tertiary); 2, *Hyracops* (Eocene); 3, *Theosodon* (Lower Tertiary); 4, *Protheroherium* (Lower Tertiary); 5, *Thoatherium* (Lower Tertiary).

were about equally functional, but began very early a specialization in two directions—the mesaxonic type with the axis of the foot in the third or middle digit, as in the perissodactyl or odd-toed forms, and the paraxonic type with the axis between the third and fourth digits as in the artiodactyl or even-toed forms. The connecting links between the great groups of ungulates have not been well established. The Condylarthra, represented by the Lower Eocene *Phenacodus*, seem to be the most primitive. The ungulates undoubtedly began to radiate in the Cretaceous, for, though none have yet been recorded for that era, there are in North America two well-marked groups, the Condylarthra and the Taligrade, in existence at the very base of the Eocene; the Taligrade specialized into the clumsy and bizarre Amblypoda (caryphodonts and untatheres) and both groups became extinct before the end of the Eocene period. The radiation of ungulates continues through the Eocene, and during this period all the great groups became well differentiated. In North America the Perissodactyla are not found in the lowest Eocene formations (Paleocene) but appear in the succeeding Lower Eocene, apparently as immigrants from a northern centre. Of the Perissodactyla the Palæotheriidae, Equidae, Tapiridae, Lophiodontidae and Titanotheriidae appear in the Lower Eocene, the Hyracodontidae in the Middle Eocene, and the Amaryndontidae and the Rhinocerotidae in the Upper Eocene. It should be noted, however, that the earliest members of the Equidae, Tapiridae and Lophiodontidae are so much alike that some authors class them all in the same family. The Amaryndonts and Rhinoceroses are also derivatives of this older group. The great expansion of this group is in the Upper Eocene and Oligocene. The Proboscidea and Hyracoida probably arose, at the latest, in the Upper Eocene of Asia or northern Africa. Besides these forms, which were common to most of North America and Eurasia, there arose in South America an ungulate fauna found nowhere else, consisting of four groups, Litopterna, Typotheria, Toxodontia and Pyrotheria. The first three of these seem to be entirely unre-

LEFT FOREFOOT OF CORYPHODON (AMBLYPOD TYPE).

the number and kinds of teeth, the comparatively short legs and long heavy tail, and the five-toed feet. The relatively close relationship of the earliest ungulates with the Creodonts is admitted by all authorities. Both groups have probably been derived from insectivorous placental mammals of the Cretaceous period.

The tendency of the group is very early shown

lated to other ungulates except to the Condylarthra. They flourished in the Miocene and Pliocene and became extinct in the Pleistocene. The Pyrotheria are regarded by Loomis as Proboscidea.

The ungulates are from the standpoint of human economy the most important, and have been the chief support of man since he attained supremacy, furnishing him with most of the food, clothing, and working assistance which he derives from animals. The four existing sub-orders are the Hyracoidea, Proboscidea, Artiodactyla, and Perissodactyla. See HYRAX; ELEPHANT; PROBOSCIDEA; RUMINANT; BOVIDÆ; HORSE; RHINOCEROS; and the names of allied groups and species. Consult: S. P. Woodward, *Vertebrate Palæontology* (New York, 1898); F. E. Beddard, "Mammalia," in *Cambridge Natural History*, vol. x (London, 1902); W. K. Gregory, "The Order of Mammals," in *American Museum of Natural History, Bulletin No. 27* (ib., 1910); H. F. Osborn, *The Age of Mammals* (ib., 1910).

UN'GULED. In heraldry (q.v.), a term applied to the tincture of the hoofs of an animal. Thus a stag represented with hoofs of a certain color is unguled of that color.

UNGVÁR, ung'vâr. A town of Hungary, capital of the County of Ung, 172 miles northeast of Budapest, on the river Ung, and on the Nyiregháza-Ungvár Railway (Map: Hungary, H 2). The former castle is now a seminary. The manufacture of pottery and vine culture engage the people. Pop., 1900, 14,723; 1910, 16,840, mostly Magyars.

UNIATES, u'ni-âts (Russ. *uniyatû*, member of the United Greek church, from Lat. *unus*, one). A generic term used to designate Eastern Christians, who, while in communion with Rome, are allowed to retain a number of their traditional local peculiarities in discipline and worship. As a rule they have their own liturgies in the Eastern tongues; they use leavened bread in the Eucharist (with the exception of the Maronites and the Armenians); their priests are allowed to marry once; and they have a body of canon law of their own, partly consisting of ancient conciliar decrees and partly of papal decisions made for their special case. Their government is cared for by a special committee of the Propaganda *super negotiis Orientalium* organized by Pius IX in 1862. The United Greeks may be divided according to the languages employed in their worship. Those with a Greek liturgy are found principally in Greece, European Turkey, Italy, and Russia, besides some 10,000 adherents in the United States. The Melchites (q.v.) employ the Arabic. There are also Rumanians with a vernacular liturgy; the Slavic is employed by the Ruthenians and Bulgarians. Under the name of Uniates are also comprehended the United Copts, descendants of the ancient Egyptians in Egypt and Abyssinia, the old Patriarchate of Alexandria; they have been united with Rome since 1732, and number some 30,000. To the Syrian rite belong the Maronites (q.v.), the Syrians proper in Asiatic Turkey, and some Syro-Chaldeans in the same region and in India. There are also Armenians in Turkey, Egypt, Russia, and Galicia; these returned to communion with Rome in the first half of the fourteenth century, and now number 150,000. The total number of Uniates is upward of six millions. See NESTORIANS.

U'NICORN (OF., Fr. *unicorne*, from Lat. *unicornus*, one-horned, from *unus*, one + *cornu*,

horn). A fabulous animal mentioned by ancient Greek and Latin authors, and described as resembling a horse, and with one horn on the forehead. The unicorn is perhaps best known as a heraldic charge or supporter. Consult Robert Brown, *The Unicorn* (London, 1881); Charles Gould, *Mythical Monsters* (ib., 1886). See BESTIARIES.

UNICORN. See MONOCEROS; ORYX.

UNICORN FISH. 1. A marine fish (*Lophotes cepedianus*), related to the oarfish and ribbon fishes (qq.v.). It has been taken both in the eastern Atlantic and off the coast of Japan, in rather deep water. It is about five feet long and silvery in color, with lighter spots and rosy fins. All the fins are minute except the dorsal, which extends the whole length of the back, and is preceded by the elevation of the

UNICORN FISH.

crown of the head into a high crest, surmounted by an exceedingly long and recurved spine, from which the fish receives its name. Its habits are unknown. (2) One of the filefishes (*Ailutera scripta*) common in the West Indies, and known there as "lija trompa." It is two or three feet long, olivaceous in color, streaked and spotted with blue and black, and has the snout produced, and a long and slender spine rising from the top of the head. Consult Günther, *Study of Fishes* (Edinburgh, 1880).

UNICORN PLANT. See MARTYNIA.

U'NIFORMITA'RIANISM. In geology the theory which seeks to account for the past history of the earth in the light of the present. It assumes that the great changes which the earth has undergone are the results of slow-working but persistent processes rather than of catastrophic agencies. The theory was first clearly stated by James Hutton and found its ablest advocate in Sir Charles Lyell; it has had an important influence in the development of geological science. See CATASTROPHISM.

UNIFORMITY, ACT OF. See ACT OF UNIFORMITY.

UNIFORMS, MILITARY AND NAVAL. A uniform is a distinguishing dress of a certain group or organization, as an army, society, etc. To obtain authentic records as to the first employment of costume devices, as they were then known, it is necessary to go back to the Crusaders. Armor (q.v.) was the badge of caste, and to distinguish one armored knight from another there were adopted and employed shields bearing what are now known as heraldic devices. (See HERALDRY.) Likewise the difficulty of distinguishing men at arms, and followers of a king or nobleman, especially in battle, brought about the introduction of a distinctive badge or pattern of dress for all the retainers of a

details this type of uniform has been practically copied by all nations in their present field-service uniforms.

France. Uniforms were first worn in France by the entire army in the reign of Louis XIII. In 1670, when the wearing of the prescribed uniform was made compulsory, the infantry were ordered to wear white coats, faced with red. The cavalry had a similar uniform with leather breeches and high boots. Under Louis XVI the uniforms were modified, the infantry wearing white, the light cavalry blue, and the heavy cavalry green. With the Revolution the uniforms were simplified—consisting of dark-blue coats, white breeches, and high gaiters. Napoleon, on account of the difficulty of obtaining dyestuff, returned to white, but, substitutes for the old dyes being found, the colored coats were again introduced. During this period the French uniforms, particularly those of the officers, were probably the most elaborate ever worn. In 1815, with the restoration of Louis XVIII, the white uniforms were again taken up, only to give way to the blue in 1820. At the same time the famous red trousers were universally adopted for all branches of the service except riflemen, artillery, and engineers, who all wore blue. During the Second Empire a return was made to the extremely elaborate dress of the Napoleonic days, but the Franco-Prussian War of 1870 proved the uselessness of many of these uniforms for modern warfare. With the reconstruction of the army after the war the general scheme of color (blue and red) was retained and the uniforms were put on a more practical basis which, except for slight modifications, are as worn at the present time. The dragoons and cuirassiers still wear their metal helmets, and the latter also the cuirass. France is the only country to retain their relics of former military glory for service in the field.

Until the great war the French had never adopted any official field-service uniform for their army as a whole. Troops on duty in Africa had been supplied with khaki, while several experimental uniforms had been tried in sections of the home army. When the war broke out in 1914 the troops went into service in their historic blue and red; the heavy cavalry, however, concealed their helmets and cuirasses with grayish-brown covers. The impracticability of the uniform was soon discovered, and a colored cloth of light grayish blue was adopted. This was said to blend better with the surroundings in the field in northern France than the khaki worn by the English. Tradition is still strong in the French service, and though the army has been equipped with the above color for caps, coats, and overcoats, they still retain the red trousers in regiments for which they are prescribed. A further innovation in the field-service uniform in the war was the equipment of infantry with a steel shrapnel-proof helmet, the use of which was so beneficial to the men engaged in trench work that the English experimented with a similar device to be issued to their advance infantry.

Germany. Any historical sketch of the uniforms of the armies of Germany previous to the formation of the Empire in 1870 would exceed the space limits of this article. Each king and ruler of petty states maintained his own army, uniforming and equipping it according to his own or his government's ideas. The army

of Prussia, under Frederick the Great, was brought to a splendid standard of efficiency, and its styles of uniforms soon after began to show themselves in the armies of the smaller German states. With the unity of Germany in 1871 the army was reorganized as an Imperial one and the Prussian uniform was adopted throughout the Empire except in Bavaria, where a lighter blue was used instead of the dark blue worn by the army in general. The modern German uniforms may be described as follows: Infantry—blue tunics, black trousers; facings according to regiments, scarlet, white, or light blue. Black leather helmets with metal spikes. Rifle regiments wear dark green instead of blue, and leather shakos. Cuirassiers—tunics of white. Dragoons and uhlans—blue, the former wearing helmets of metal, the two latter of leather. The hussars' tunics are of various colors according to regiments—their head-dresses busbies of brown fur. Artillery and engineers wear uniforms of blue throughout, with trimmings of black and scarlet.

Experiments with a field-service uniform were begun immediately after England's war with South Africa, but it was not until 1908 that a definite uniform was decided upon. The army has since then been gradually equipped with these: field uniforms of brownish gray, the cut and color of trimmings as prescribed for the ordinary uniforms retained, as well as the helmet, busbies, and shakos. These are concealed for service by a covering of the same color as the uniform. Military critics of the great war agreed that it was the most practical of the uniforms now in the field as far as adaptability for concealment is concerned, though the tight-fitting tunics and heavy helmets are unsuited for modern warfare.

Italy. The uniforms of the Italians have been rather French in character, particularly since the Napoleonic conquest of Italy, but of an endless variety of colors. Previous to the unity of the country in 1861 each separate kingdom and state maintained and dressed its army as it saw fit. Many attempts to establish uniformity were made previous to 1870, but it was not until that date that the entire army came under one dress regulation. These regulations were changed in 1890, at which time the present uniform was adopted. Infantry—dark-blue tunic, gray trousers, cloth shako; cavalry—dark-blue tunic, gray breeches; lancers—busbies; dragoons—helmets; artillery and engineers—dark-blue tunic and trousers. The distinctive corps of the Italian service is the Bersaglieri (q.v.). The Italian field uniform is extremely practical, the color being brownish gray, the cut loose and comfortable. It was first introduced about 1908, the entire army being equipped at the time of the war with Tripoli, in 1911.

Russia. The early Russian uniforms followed closely the costumes of the people until the reorganization of the army by Peter the Great when it was modeled after that of the Germans. With certain modifications this practice has continued except that the ground color has been green instead of blue and the helmets have been superseded in recent years by hats of a more distinctive Russian character. The infantry uniform in 1916 was dark green, with facings of red, blue, or yellow according to regiments. Cavalry wore green or blue coats with gray breeches. Artillery and engineers wear the same

as infantry except for distinctive markings. All branches of the service, both foot and mounted, wear knee boots in which the trousers are tucked. The distinctive corps of the Russian service is the Cossacks (q.v.). Nothing was done in regard to a field-service uniform until the Russo-Japanese War in 1905, when in this respect the Japanese had a great advantage over their adversary. The Russian troops in the field were gradually supplied with makeshift service uniforms, and on the reorganization of the army after the conclusion of hostilities a field-service outfit was adopted, the color of which is olive drab, similar to that worn by the English, but the general cut and color markings of the regular uniforms have been preserved.

The uniforms of the smaller nations of Europe reflect, in a general way, those in use by their more powerful neighbors. Norway, Sweden, and Denmark incline to German styles. Belgium, Holland, Switzerland, Spain, and Portugal all favor the French; while in the Balkan region Rumania follows the French, Serbia Austrian, Bulgaria Russian, and Greece French with a leaning to English for field service. Turkey has been so long under German domination that their uniforms are distinctly on the line of the army of that country, with the exception of the universal wearing of the fez.

Of the two military nations of Asia the Japanese on the reorganization of their army on European lines largely copied the French, though their field-service uniform is modeled after that worn by the British army. They were thus uniformed for the field in the war with Russia in 1905, since which time the field uniforms have become the regular uniform of the army, the old colored uniforms being worn only by a few regiments of the Imperial Guard for occasions of ceremony. When China reorganized its army on European lines in 1902 it first adopted a mixed uniform, half Chinese and half European, but this speedily gave way to a more practical outfit of blue for dress and of khaki for service, the latter being rather German in cut and pattern, though many features were copied from the United States.

The principal South American countries all maintain armies, the organization of which was generally effected under the guidance of officers from European countries and the uniforms reflect the ideas of these organizers and early instructors, those of Brazil and Argentina being French and that of Chile, German. The uniforms of the smaller countries play but a small part in the armies—in many cases only the officers wear them. Mexico was distinctly French until the revolution following the fall of Diaz when the uniforms, such as they were, became American in general appearance.

UNITED STATES

The dress of the United States army prescribed in orders has in practice been marked by irregular and unauthorized modifications. This has arisen partly from the American tendency to sacrifice display to utility. At the beginning of the American Revolution each regiment provided its own uniforms, and later it became necessary at times to call upon the inhabitants to contribute cast-off clothing to clothe the patriotic soldiers. Such uniforms as were worn were English in design, substituting blue for scarlet coats. The close of the Revolu-

tion found the troops, generally, in a condition not unlike Falstaff's recruits. Measures were at once taken to uniform properly the few troops retained in service and the uniforms then selected closely followed the French, that of the infantry being blue faced with white, and the artillery, blue faced with red, these being then the only two arms in the composition of the army. Later cavalry was added, wearing green coats with white facings, which soon after changed to black. Since that time the uniforms of the army can be divided into periods, each of which dates back to the close of one of the wars.

Various changes were made in the bill of dress until the War of 1812, when the large number of militia organizations were hastily summoned into the service with their distinctive uniforms and the necessity of hastily equipping a large number of volunteer recruits made it impossible to adhere to the dress regulations, and the close of the war again found the army uniforms in a chaotic state. The reconstruction again brought in the French style of the period, and the dark-blue coat for all branches of the service was then adopted, the trousers or breeches being white or light blue. A later innovation was the clothing of the rifle regiments in gray. The different branches of the service, staff departments, etc., were each designated by a distinctive color or combination of colors in their trimmings. These varied at different times, as did the details until the Mexican War period, when after conclusion of hostilities the uniform regulations were again completely revised. Color trimmings were then positively adopted. Cavalry, yellow; infantry, light blue; artillery, red; medical department, green. All staff departments, black. As new departments were organized the following colors were added: engineers, red, piped with white; signal corps, orange, piped with white; ordnance department, black, piped with red; quartermaster corps, buff. The infantry color was changed to white, but in 1902 returned to light blue. At the same time maroon was substituted for green in the medical department. The colors given above are as used at present.

The beginning of the Civil War, on account of the influx of State organizations, found the army again clothed in a variety of uniforms, but before the termination of the conflict the undress, or service uniform, of the time (dark-blue coat, light-blue trousers with prescribed trimmings) was universally worn by both regulars and volunteers. Full-dress and show uniforms had entirely disappeared during the four years of active campaigning, and it was necessary to reconstruct the army bill of dress at the close of the war. The French style and cut were again copied, but no change was made in the colors or color trimmings. At the close of the Franco-Prussian War in 1870 there was a strong feeling that the uniform of a nation successful in war should be copied, and the new bill of dress prescribed the German cut of clothing with the spiked and plumed helmets.

The Spanish War of 1898 again brought into service large bodies of volunteers, but the State troops in recent years had been more or less uniformed in accordance with the army uniform regulations, and consequently there was less variety of dress than on former occasions of the calling in of volunteers. The heavy blue uniforms were found to be very unsuited for

service in the tropics, and a service uniform of khaki cotton was introduced. The necessity of speed in equipping troops caused the government to supply clothing that varied in many ways from the regulations, and it was found impossible after the close of the war to readjust this state of affairs by alterations or reissues. The whole dress regulation, as it then was, was therefore wiped out in 1902. The new regulations made such radical changes that it was necessary to uniform anew the entire army. These regulations, except for minor changes, remain in force. In the new dress the result of the experience of all nations as to utility and ornamentation was considered. Officers' uniforms are classed as full dress, dress, and service. The full-dress coat for an officer is a double-breasted tunic with a collar of the color of his respective branch. Rank is designated on the shoulder knots and by braiding on the sleeve. The dress coat, except for general officers, is a dark-blue sack coat with concealed hooks instead of buttons and trimmed with broad black braid. Rank is indicated on the shoulder straps. Trousers are of a lighter shade of blue with the proper colored stripes. Officers also have a special dress for evening wear which, in the case of the coat, is cut on the lines of a civilian dress coat, trimmed as prescribed for the full-dress uniform coat and worn with a civilian dress shirt and white waistcoat. The enlisted men have but two uniforms—dress and service. The former is a single-breasted sack coat with facings of the branch of the service. Trousers or breeches are of a lighter blue, noncommissioned officers only having stripes of the proper color. Caps for officers and men are of the same design, the band being decorated with the proper colors, those of the officers having additional trimmings of gold lace.

In the 1902 dress regulations the olive-drab service uniform was first officially included. The color is a trifle darker and nearer a green shade than that known as khaki, and the uniform is prescribed in both woolen and cotton material according to the climate for which it is intended. The cut of these uniforms is similar for both officers and men, and follows closely the English model used in the South African War. The coat is cut with a loose and comfortable fit, supplied with four outside patch pockets, and the breeches (worn by all branches) confined below the knees with laces or buttons. The lower legs are protected by boots, or leggings of tan leather for officers, and canvas leggings for men. Overcoats, campaign hats, service caps, and other articles of equipment conform in color to the uniform. Designations of organizations, buttons, and other metal ornaments are made of bronze-colored metal. Officers wear their insignia of rank on the shoulder straps. See MILITARY INSIGNIA, and Plates under INFANTRY.

The National Guard, or, as it is officially known, the "organized Militia," of the United States, is now completely organized, uniformed, and equipped in accordance with the army regulations. There are a few historic organizations which for reasons of sentiment and tradition are allowed to retain their distinctive full-dress uniforms. These are provided and maintained at the expense of the members, are worn for parade purposes only, and never are used when ordered into the State or Federal service. The principal organizations which have retained

their distinctive uniforms are the First and Second Troops, Philadelphia City Cavalry; Seventh, Twenty-third, and Seventy-first Infantry and Squadron A Cavalry, New York; First Corps of Cadets, Massachusetts; Fifth Infantry, Maryland; and Richmond Light Infantry Blues, Virginia.

NAVAL UNIFORMS

Modern naval uniforms are marked by the same general characteristics throughout the navies of the world, and resemble each other closely. This is due to the fact that naval officers and men are exposed to the same conditions and that the ceremonies and usages at sea obtain in much the same form under different flags. The uniforms of the United States navy, described below, may be considered fairly typical, and the deviations are usually in such details as epaulets, gold lace, insignia, etc., for which each service has its own minute regulations.

The uniform for the British navy closely resembles that of the United States navy. For officers there are eight different suits to be worn on specific occasions, as follows: full dress, ball dress, frock coat with epaulets, frock coat, undress, mess dress, mess undress, white undress. The undress uniform differs from that worn in the United States navy in that it has a double-breasted coat with brass buttons instead of the blouse trimmed with braid. On all uniforms the distinctive marks of rank are stripes on the sleeves and appropriate devices on the shoulder strap or epaulet. The significant degrees on the latter are as follows: admiral of the fleet, crown, and crossed cannon surrounded by a wreath; admiral, crown, crossed sword and baton, and three stars; vice admiral, the same, with two stars; rear admiral, the same, with one star; a commodore or senior captain has a crown and anchor and two stars, while a junior captain has the same with one star; a commander has a crown and anchor, a senior lieutenant a star and anchor, and a junior lieutenant an anchor.

The Russian navy in its dress resembles the British, but is less elaborate and has some peculiarities. Officers (in winter) wear a dark-blue frock coat, a reefer jacket, or a monkey jacket; in summer, white. The cap is high, flat-topped, and of the color of the dress worn. Cocked hats are required for full dress. In winter both officers and men wear a brown woolen cape, also goloshes over the boots. The Russian officer out of quarters is always in uniform. The enlisted man in winter wears a short gray overcoat, belted at the waist. On shore duty he wears a military tunic and leggings.

The uniform of officers of the United States navy consists of three classes—dress, undress, and service dress. The dress uniforms are, special full dress, full dress, dress, evening dress

D.W.G. TALLS

A, evening dress B, mess dress. The undress uniforms are undress A and undress B. Service dress is either blue or white. The special full-dress uniform consists of a double-breasted blue broadcloth coat with standing collar and 18 gilt buttons, nine in each row; blue trousers with a stripe of gold lace down the outside seam; epaulets, cocked hat, sword, and full-dress belt. The undress A uniform consists of a double-breasted blue frock coat similar in cut to the civilian's coat, but having 10 gilt buttons, five each side, and with shoulder fixtures for epaulets; a blue waistcoat with seven gilt buttons, cap, sword, plain leather belt, and plain blue trousers. The service suit consists of a blue or white blouse with standing collar and trimmed with braid; blue or white waistcoat with seven gilt buttons; plain blue or white trousers. The evening dress suit is similar in cut to the civilian evening dress suit, but the buttons are gilt and the coat is fitted with shoulder fixtures for epaulets; the waistcoat may be blue or white as ordered. The mess dress consists of the white mess jacket, cut like the evening dress coat without the tails, white waistcoat, and blue or white trousers.

The various styles of uniform are made up from these. The special full dress is used on occasions of special ceremony. The full dress is used on less important occasions. It consists of the frock coat with epaulets, cocked hat, full-dress belt, and special full-dress trousers. The dress uniform, used for particular official calls, consists of frock coat, epaulets, cocked hat, plain belt, blue trousers. Undress A is the same as dress except that epaulets are not worn and the blue cap is substituted for the cocked hat; it is used for service on courts-martial, reporting for duty, etc. Undress B differs from undress A only in omitting the sword and belt. It is used for ordinary official and semiofficial calls, etc. Service dress is worn at all times when some other special uniform is not provided. The mess dress is worn at dinner when ordered.

On all except white uniforms the rank of an officer is indicated by gold lace on the sleeve and devices on the collar, epaulet, or shoulder mark. Ensigns and officers of that rank wear one stripe of half-inch gold lace; lieutenants of the junior grade, a stripe of half-inch lace and a stripe of one-quarter inch lace above it; lieutenants, two stripes of half-inch lace; lieutenant commanders, two stripes of half-inch lace and a stripe of one-quarter-inch lace between them; commanders, three stripes of half-inch lace; captains, four stripes of half-inch lace; rear admirals, one stripe of two-inch lace and one of half-inch lace above it; admiral, two stripes of two-inch lace and one stripe of half-inch lace between them. All officers of the line or executive branch wear a gold star on the sleeve above the lace. On the overcoat and white service coat the lace is worn on the shoulder marks instead of on the sleeve. The ornaments indicating rank, which are worn on the collar and epaulet, consist of the corps device and rank emblem. The former consists of a silver fowl anchor for line officers, sprig of silver oak leaves for pay corps, gold oak leaf and silver acorn for medical corps, a silver oak leaf and acorn for professors of mathematics, silver cross for chaplains, two gold live-oak leaves and acorn for naval constructors, and the letters C. E. in silver for civil engineers. The rank emblem for an admiral is four silver stars with

a gold fowl anchor under the outer ones; for a rear admiral, two silver stars and a silver fowl anchor or other corps device between them; for a captain, a silver eagle; for a commander, a silver oak leaf; for a lieutenant commander, a gold oak leaf; for a lieutenant, two silver bars; for a lieutenant of the junior grade, one bar. Ensigns and officers of that rank wear only the corps device.

White uniforms are worn in hot weather. The overcoat is of the ulster type with very broad collar and black rubber buttons. Rank is indicated by the shoulder mark and mohair stripes on the sleeve. Warrant officers wear no stripes on the sleeve and no shoulder ornaments. The collar ornaments are a crossed anchor for boatswains, a bursting shell for gunners, a gold chevron for carpenters, and a gold propeller for warrant machinists. When commissioned after six years' service, chief warrant officers wear a half-inch gold stripe with an inset of blue silk and silver collar ornaments.

The uniform of enlisted men consists of dress, undress, and working dress; each of these may be white or blue. Chief petty officers wear double-breasted blue or white coats with gilt buttons. Other enlisted men wear a blue shirt or white dress jumper for dress, with blue cloth trousers. Undress is merely less neat or new uniform, if blue; but white undress has a narrow white collar instead of a broad blue one; working dress is old blue or white uniform and is worn without a neckerchief. Rating badges for petty officers are worn upon the sleeve. Chief petty officers wear caps with visors and an ornament consisting of a gold fowl anchor; other enlisted men wear round blue caps with a flat top projecting beyond the band all around the head when in blue uniform and a white canvas hat when in white.

U'NIGEN'ITUS. A papal bull issued in 1713 condemning the principles of Jansenism (q.v.).

UNIMAK, ū'nē-māk'. The largest and easternmost of the Aleutian islands (Map: Alaska, E 8). It is separated from the southwest extremity of the Alaska Peninsula by a narrow, unnavigable channel. It is 70 miles long; average breadth, 20 miles. Barren and mountainous, it contains two volcanoes, 'Pogromni, 6500 feet, and Shishaldin, 9387 feet, occasionally showing signs of life. There is a scant and shifting population of Aleuts.

U'NIO. The type genus of the family Unionidae, which contains the greater part of the freshwater mussels (q.v.).

UNION. See TRADE-UNIONS.

U'NION. A town in Hudson Co., N. J., adjoining Weehawken and West Hoboken, on the Rahway Valley Railroad (Map: New York City, Greater New York and Vicinity, B 4). It is of considerable importance as an industrial centre, being interested largely in the manufacture of silk and embroidered goods. There are also breweries and a shirt factory. Union has a Carnegie library. Pop., 1900, 15,187; 1910, 21,023; 1915 (State census), 21,739; 1920, 20,651.

UNION. A city and the county seat of Union Co., S. C., 65 miles northwest of Columbia, on the Southern and the Union and Glenn Springs railroads (Map: South Carolina, C 2). It is the commercial centre of a farming and cotton-growing region, which also has truck and fruit interests. There are four large cotton mills, an oil mill, and two knitting mills. Noteworthy features are the Carnegie Library, high school,

county courthouse, and Federal building. Pop., 1900, 5400; 1910, 5623.

UNION, BROTHERHOOD OF THE. See **SECRET SOCIETIES.**

UNION, EVANGELICAL. See **EVANGELICAL UNION.**

UNIÓN, 00'né-0n', LA. A town of Murcia, Spain, near the Mediterranean coast, 5 miles east of Cartagena (Map: Spain, E 4). The country is a mineral region, producing iron, manganese, sulphur, and carbonate of lead. The town was founded in the second half of the nineteenth century. Pop., 1900, 28,479; 1910, 30,249.

UNIÓN, LA. A province of northern Luzon, Philippine Islands (Map: Philippines, C 2). Area, 634 square miles. The province is mountainous and forested, but much of the land is well cultivated, producing tobacco, rice, cotton, corn, sugar, and cacao, while stock raising is also important. A telegraph line, as well as the main highroad and the unfinished railroad from Manila to Laoag, runs through the province. Pop., 1903, 137,839, chiefly Ilocanos and Igorots. Capital, San Fernando (q.v.).

UNIÓN, LA. A port of the Republic of Salvador and capital of the Department of La Unión, situated at the southeast extremity of the country, on an inlet of the Gulf of Fonseca, and at the foot of the volcano of Conchagua. It exports minerals and carries on an active trade with the interior (Map: Central America, D 4). Pop. (est.), 5352.

UNION, NATIONAL. See **NATIONAL UNION.**

UNION CITY. A city in Randolph Co., Ind., and adjoining Union City in Darke Co., Ohio, 84 miles northeast of Indianapolis, on the Cleveland, Cincinnati, Chicago, and St. Louis, the Dayton and Union, the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Ohio Electric railroads (Map: Indiana, H 4). It has a Carnegie library and the Ford Hospital. The leading manufactured products are automobiles, carriages, wheels, butter, furniture, and hoops. Pop., 1900, 2716; 1910, 3209 (Union City, Ohio, 1910, 1595).

UNION CITY. A borough in Erie Co., Pa., 26 miles southeast of Erie, on the Pennsylvania and the Erie railroads (Map: Pennsylvania, B 2). There are three large chair factories, planing and grist mills, a powdered-milk plant, and several furniture factories. Pop., 1900, 3104; 1910, 3684.

UNION CITY. A city and the county seat of Obion Co., Tenn., 112 miles by rail north by east of Memphis, on the Nashville, Chattanooga, and St. Louis, and the Mobile and Ohio railroads (Map: Tennessee, B 2). It is important as a shipping point for farm produce, chiefly wheat, corn, and hay, and manufactures flour, brooms, mattresses, decoy ducks, raincoats, and foundry and lumber products. Union City has a Carnegie library and the Nailling Hospital. Pop., 1900, 3407; 1910, 4389.

UNION COLLEGE. A coeducational institution of higher education at College View, Neb., founded in 1890, under the auspices of the Seventh Day Adventists. The campus consists of 22 acres, on which are the main college buildings. The college curriculum includes a department of Bible study, history, English, ancient and modern languages, mathematics, commerce, agriculture, education and normal training, expression, art, and music.

The total enrollment of students in the autumn of 1915 was 420, and the faculty numbered 26. The library contains about 6000 volumes. The college property is valued at about \$200,000. The president in 1916 was Harvey A. Morrison.

UNION COLLEGE. An institution of higher education at Schenectady, N. Y., incorporated in 1795. It was the second college incorporated in the State, and received its name from the cooperation of several denominations in its organization. In 1828 a scientific course was established parallel with the classical course. The progressive policy of Union at this period was due chiefly to the genius of Dr. Eliphalet Nott, president from 1804 to 1866. The college fraternity system originated at Union (1825). In 1873 the Law School, Medical College, and Dudley Observatory in Albany were associated with Union College under the title of Union University, and the Albany Course of Pharmacy was added in 1881. The degrees conferred in course are B.A., Ph.B., B.S., B.E., M.A., M.S., M.C.E., M.E.E., and Ph.D. The students in the college in 1915-16 numbered 494, and the faculty 41. The library contained 45,000 volumes, the invested assets were \$98,000, the property valuation was \$1,500,000, and the income \$145,000. The president in 1916 was Charles A. Richmond, D.D., LL.D.

UNION JACK. The combined crosses of St. Andrew, St. George, and St. Patrick, used as the flag of Great Britain. See **COLORS; FLAG; JACK; NATIONAL FLAGS, Great Britain.**

UNION LABEL. A trade-mark or advertisement owned and registered by a trade-union and attached to articles of sale, signifying that they have been made in establishments employing union labor only, and under conditions stipulated by the union. The label seems to have been first used by the California cigar makers about 1874. It appeals with particular force to the more conservative trade-unionists, who praise it as a peaceable and inexpensive way of increasing the power of the unions; they frequently describe it as the legal boycott. Its use is spreading rapidly. In most States statutes impose penalties for counterfeiting the label or knowingly using a counterfeit. In several trades, e.g., cigar makers, printing, and the hatters' trade, the label has become a factor of first importance.

UNION LEAGUE CLUB OF THE CITY OF NEW YORK, THE. One of the leading social and political organizations of the United States. It was incorporated by the New York State Legislature, Feb. 16, 1865. The qualifications for membership are United States citizenship and absolute and unquestioned loyalty to the government of the United States. The club has been a stronghold of Republicanism and its influence has been repeatedly exerted for the Republican party in national and local elections. The number of annual resident members is limited to 2000, and 100 members constitute a quorum at all meetings. The club has quarters at Fifth Avenue and Thirty-ninth Street in New York City. Similar institutions of the same name and purposes have sprung up in other cities, notably in Philadelphia and Chicago.

UNION OF SOUTH AFRICA. A state of the British Empire, formed May 31, 1910, by the uniting of the self-governing colonies of the Cape of Good Hope, Natal, the Transvaal, and the Orange River Colony (now Orange River Free State), which became provinces of the

union. For a description of the physiography and other natural features, see under SOUTH AFRICA, and under the individual titles of the provinces.

Geology and Mineral Resources. The discovery of diamonds and gold had a profound effect upon the condition and prospects of South Africa, bringing the country in a few years into universal notice. Many millions of dollars have been disbursed in wages and local expenses at the mines. (For geology, gold, and diamonds, see CAPE OF GOOD HOPE; TRANSVAAL; KIMBERLEY; ETC.) The copper mines of Namaqualand are unsurpassed in richness of yield. The principal silver mine worked is 50 miles east of Johannesburg, 6 miles from coal fields, but indications of silver have been found in many parts of South Africa. Enormous deposits of coal and iron have been discovered in Cape Colony and Natal in close proximity. Coal is also mined in the Transvaal and the Orange River colonies, and at the Wankie coal fields in Rhodesia, southeast of Victoria Falls. Platinum, plumbago, manganese, and the finest of marble, building stone, and lime are also among the mineral resources.

Agriculture. The soil is extraordinarily productive wherever rainfall is sufficient; but the chief interest is stock raising, the country, as a whole, being better suited for pastoral pursuits than for agricultural operations. Wool is the staple source of wealth, the grasses of the veldt and the pasture plants of the karroos being well suited for growing the finest wools. Many millions of sheep are pastured in the Cape Province, Natal, Orange Free State, the Transvaal, Bechuanaland, etc. Angora goats and cattle also abound. The "Cape horse" is not handsome, but is hardy and keeps in good condition on the veldt. Across the south end of the country is a strip of fine farming land, where wheat, maize, and all the crops of the temperate zone are very successful. The best wheat is grown along the southern border of the Orange Free State. In the Cape Province fruits are largely exported, and ostrich farming and cattle raising are important. It is to the advantage of South Africa that its great variety of climate enables it to grow nearly every cultivated crop. Sugar growing and tea planting in Natal have passed beyond experiment: sugar is now exported, and the tea is excellent. Coffee and arrowroot thrive on the moist coastlands.

Manufactures. Little attention has been given to manufacturing, chiefly on account of the sparsity of the white population. A large quantity of Cape wine and brandy is produced; they are of inferior quality, though improving from year to year. The chief centres of the manufacturing industries are in the Cape Province, where flour mills, tobacco factories, tanneries, diamond washing, and gold and copper reduction works are most prominent; and in the Transvaal, where there are saw mills, brick and lime works, machine shops, etc.

Commerce. Prominent among the "makers" of the country are still the traders, who load their heavy wagons, carrying three to four tons, with all kinds of goods desired by the black population, and trek from tribe to tribe, returning to town or port after many months to dispose of the ivory, horns, skins, and feathers received in exchange for their wares. The trekking trade has been the means of diverting most of the commerce, even of the Zambezi region, to

the southern ports. The circulation of goods is to and from the seacoast, there being little trade between town and town, as all are supplied from the seaport centres. Except during the Boer War the "Cape trade" has steadily grown. Imports and exports, exclusive of specie, were valued in 1908 at £24,532,520 and £43,910,451; in 1913, £41,828,841 and £66,569,364. Great Britain controls nearly all exports, those which reach other countries being mainly through British channels. Gold, diamonds, and wool are the great export staples, with ostrich feathers, hides and skins, coal, and mohair next in importance. The exports of 1914 included gold, £35,664,000; diamonds, £5,487,000; wool, £4,238,000; and ostrich feathers, £1,343,000. Many of the imports (general manufactures, machinery, etc.) come from countries other than Great Britain. During 1913 the imports from the United States amounted to over \$18,350,000, while the exports to it were \$2,609,500.

Transportation and Communication. In the more settled districts there are fairly good roads with substantial bridges across the rivers. Mail carts, coaches, or bullock wagons ply between the railroad stations and all the larger towns not on the rail lines. There is now rail connection between all the important ports of the south and east coasts and the larger interior towns and mining districts. One may travel by rail from Cape Town to Salisbury, in Mashonaland, and thence to the port of Beira. It is expected that before many years the railway system of South Africa will be connected with that of Egypt. The length of government railway (the South African railways) in operation at the end of 1914 was 8486 miles. Post and telegraph offices, 2790; telegraph line, 15,021 miles; wire, 50,352 miles. Regular communication is maintained with Europe, America, and Australia.

Population. The population in 1904 was 5,175,824; 1911, 5,973,394 (3,069,392 male, 2,904,002 female). In 1911 the population comprised 1,276,242 whites, 4,019,006 natives, and 567,962 other colored persons. Of the total population in 1904, 21.58 per cent were white; in 1911, 21.37 per cent. Of the 1911 population of 5,973,394, about one-half was in Cape of Good Hope Province.

Government. The central government is in the hands of a Union Parliament which exercises supreme control subject only to the will of the British Parliament in London. In each of the four provinces there is a local assembly with power over purely local matters. The constitution of the Union is amended in the same way as an ordinary bill is passed, except in special matters, such as those relating to the equality of the Dutch and English languages and native rights in Cape Colony; such matters require a two-thirds majority of both Houses sitting in joint session.

The Parliament is composed of two Houses, a Senate of 40 members and a House of Assembly of 121 members.

In the House of Assembly the provinces are not represented strictly in proportion to population. From the Cape of Good Hope 51 members are sent, from the Transvaal 36, from Natal 17, and from Orange Free State 17. The conditions for voting are determined by each province; in the Transvaal and Orange Free State there is virtual manhood suffrage, in the Cape and in Natal there are property and edu-

cational qualifications. In the Cape natives are permitted to vote, but are disfranchised in the others.

The Union has two capitals; the Parliament sits at Cape Town but the centre of administration is at Pretoria. The executive consists of a cabinet of seven members appointed by Parliament and responsible to it. The prevailing law in the Union is the Roman Dutch system, although the English common law is gradually superseding it.

The first Governor-General appointed was Viscount Gladstone, son of the famous statesman, and the first Premier was General Botha at the head of a cabinet composed entirely of Boers, the leading ones being Smuts, Hertzog, and Fischer.

History. Almost from the very start the chief question before the Union was the treatment of the Dutch language. General Hertzog became an uncompromising advocate of the rights of Dutch to at least equal treatment with English. The matter was compromised by the use of both languages in all official communications. In the schools, the mother tongues of the pupils were to be used in the lower grades, and in the upper, English and Dutch were to be used alternately.

In 1912 a ministerial crisis was brought about by General Hertzog who accused Premier Botha of imperialism or too much leaning to the side of the British Empire as against the interests of South Africa. The question whether Imperial or South African interests should dominate came to the front as a result of the presence of many Hindoo laborers against whom restrictive legislation had been passed. A strike of Hindoos took place and serious rioting was the result. Their cause was taken up by patriots in India who prevailed on the British government to protest against the discriminating legislation. The matter was serious and the Botha cabinet favored a repeal or modification of these laws. The Nationalist party broke into two factions, one supporting Botha and the other Hertzog. The latter, with the support of the Unionists, attempted to wreck the ministry but failed, and he was obliged to resign. The matter was partially settled by removing many of the disabilities of the Hindoos, such as the special poll tax; and the restriction of emigration of Hindoos to South Africa was promised by the Indian government.

In 1913 came the great strike of the miners on the Rand. The men demanded an eight-hour day, recognition of their union and a share in the appointment of mine inspectors, all of which were refused by the mine owners. The strike was accompanied with great violence and the troops were called out to suppress it. General Botha intervened and brought about a reinstatement of the miners pending an investigation by the government. During the following year (1914) an attempt was made by the union to bring about a great general strike of all the miners. The government arbitrarily arrested the leaders of the movement and as a result the strike collapsed. It then forcibly deported to England the leading labor agitators on the Rand in order to prevent a recurrence of labor troubles.

The Union Parliament then voted an act of indemnity, exonerating the government for their arbitrary acts. Laws were passed prohibiting all forms of picketing, peaceful and otherwise;

strikes on public works were made punishable by severe penalties. A resolution was also passed permitting the government to deport any one convicted of sedition or public violence. As a result of these antilabor laws, the working classes of South Africa organized a Labor party to oppose both the Nationalists and the Unionists. In the great war which began in 1914, the forces of the Union of South Africa successfully put down a revolt under General De Wet and also conquered many of the possessions of Germany in Africa. See WAR IN EUROPE; BOER; CAPE OF GOOD HOPE; NATAL; ORANGE FREE STATE; SOUTH AFRICAN WAR; TRANSVAAL.

UNION SPRINGS. A city and the county seat of Bullock Co., Ala., 40 miles east-southeast of Montgomery, on the Central of Georgia and the Birmingham and Southeastern railroads (Map: Alabama, D 3). Cotton, cottonseed oil, spokes and handles, guano, and foundry and machine-shop products are manufactured. The city has a Carnegie library. It was incorporated in 1844. Pop., 1900, 2634; 1910, 4055.

UNION THEOLOGICAL SEMINARY IN THE CITY OF NEW YORK, THE. An institution, Presbyterian in origin but independent of all ecclesiastical control, founded in 1836 and open to students of every denomination of Christians. It offers a three years' course leading to a diploma with the degree of bachelor of divinity, a three years' course leading to a diploma without the degree of bachelor of divinity, a graduate course of not less than three years leading to the degree of doctor of divinity, and other special graduate courses. Candidates must be graduates of colleges of recognized standing, must complete satisfactorily 40 two-year hours of class-room work and must satisfy departmental requirements in Old Testament, New Testament, Church history, systematic theology, religious education, and practical theology. The requirements for candidates for the diploma without the degree are the same as those for the diploma with degree, with the exception that in the Old and New Testament Departments English substitutes may be offered for Greek and Hebrew exegesis. To obtain the degree of doctor of divinity candidates must be bachelors of divinity of five years' standing, must spend three years of graduate theological study, must be able to read Latin, Greek, and Hebrew, and use French and German with entire facility, must devote three years of study to a major subject, must choose two minors under the direction of the faculty, must pass searching examinations in the subjects chosen, and must publish a book which shall constitute in the judgment of the faculty a real contribution to theological science.

The seminary offers a number of merit scholarships with incomes of \$100 to \$175, prize scholar-

ships of \$250, a limited number of graduate scholarships, and two fellowships of \$600 appropriated to the use of incumbents prosecuting special studies for two years either in the United States or Europe. The seminary buildings are on Broadway at 120th to 122d streets. The library in 1915 contained 123,000 volumes, 64,700 pamphlets, and 224 manuscripts. There were 32 professors and instructors in the same year, and 275 students.

UNIONTOWN. A city and the county seat of Fayette Co., Pa., 70 miles by rail south by east of Pittsburgh; on the Pennsylvania and the Baltimore and Ohio railroads (Map: Pennsylvania, B 8). The city is the commercial centre of a region containing extensive deposits of coal and iron. Its industrial establishments include coke ovens, a foundry, brick yards, and manufactories of glass, flour, etc. It was incorporated as a borough in 1796, and chartered as a city in 1915. Pop., 1900, 7344; 1910, 13,344; 1915 (U. S. est.), 19,960; 1920, 15,692.

UNION UNIVERSITY. See **UNION COLLEGE**.

UNION VETERAN LEGION. See **VETERAN LEGION, UNION**.

UNION VETERAN UNION. See **VETERAN UNION, UNION**.

UNISON (from ML. *unisonus*, having one sound, from Lat. *unus*, one + *sonus*, sound). In music, a tone of the same pitch as another. In this sense the term unison is identical with the interval of the prime. The term has, however, been extended so as to include all parts performing the same melody.

UNIT (formerly also *unite*, *unitie*, *unity*, from Lat. *unitas*, oneness, from *unus*, one). A certain fixed quantity employed for measuring other quantities and for stating their magnitude. Ordinarily a unit is the smallest complete measure of value, extension, duration, mass, etc. An arbitrary unit is one which may be employed in the form of a concrete standard and which is generally available for reproduction. An example of such a unit is the distance between two marks in gold plugs on a bronze bar in the possession of the British Board of Trade, or the British Standard Yard. Similarly the meter of the Archives at Paris (see **METRIC SYSTEM**) is an arbitrary unit. Fundamental units are those selected arbitrarily on account of the ease with which standards can be constructed or reproduced and from which other units can be derived. In the C. G. S. system (q.v.) the fundamental units are those of length, mass, and time, from which units have been derived for area, volume, velocity, force, work, etc., magnetic units, electro-magnetic units, etc. In certain instances the derived units in the C. G. S. system may be in such shape that they are not available for general use and either a multiple or a fraction must be employed. Such units are known as practical units. Examples of practical units in common use are the ohm, the volt, and the ampere. See **C. G. S. SYSTEM**; **ELECTRICAL UNITS**; **MECHANICAL UNITS**; **METRIC SYSTEM**; **MONEY**; **WEIGHTS AND MEASURES**; **ETC.**

UNITARIANISM. The word is sometimes used in a restricted sense as the belief that God is a single undivided personality (as contrasted with trinitarianism, which is the belief that in God there are three persons). In this sense it applies not only to part of Christianity but to many non-Christian religions.

More correctly it means the system of religion of certain churches and individuals whose Christianity is of the liberal type. The essential characteristic of Unitarianism is its emphasis on spiritual religion as contrasted with all material expressions of it. All minor characteristics are implications of that. Its principal thesis is that at the core of all religions is the communion of the human soul with God, the life of God within the spirit of man; that all religions have this religion of the spirit. Religion is, then, an experience and an inner life. All forms, ceremonies, creeds, organizations, etc., in which this religion of the spirit expresses itself are of only secondary importance. Hence Unitarianism insists on emphasizing the inner reality of religion above all other things. It uses forms of worship, and organizes itself in various ways, but always subordinates these things to the religion of the spirit. The attitude of Unitarianism on all religious questions is to be seen from this point of view.

Creeds.—Unitarians have no creed. They hold that a fixed statement of belief is an obstruction to faith, and that as the life of God within the human spirit is a growing life, the consciousness of that life, which is faith, is to be allowed to grow continually. For purposes of instruction the beliefs of Unitarians are sometimes stated in definite form, but always with the proviso that the statement is not final. **Church.**—The church is regarded as the voluntary association of those who find fellowship in the religion of the spirit. It is not the source from which religion is to be drawn, rather is it a product of religion; an organization for comradeship in the growing life of the spirit. **Bible.**—The Bible is regarded as an endeavor of the religion of the spirit to express itself in literature; the record of the growing spiritual consciousness of a race. **Authority in Religion.**—The attitude of Unitarianism towards authority is central. As it regards the church and the Bible as outer expressions of the inner reality, the religion of the spirit, it refuses to grant to either an authority over the human mind, though both are useful in an exalted degree in the growth of spiritual consciousness. Here is an essential contrast with other divisions of Christianity: Catholicism which assigns to the church the final authority, and the various forms of Protestantism which regard the Bible as the final authority. Unitarianism insists strongly that the final authority in religion is in the inner life, that God Himself speaks there to the living spirit; that He speaks in reason, conscience, experience, and the highest perceptions of the spirit and the fullness of human thought. It holds that the religion of the spirit has not only a priority in time but a present logical priority to the church and the Bible, and that these, being the outcome of the inner life, cannot have a supreme authority over it. **Freedom.**—Unitarianism asserts freedom as an absolute essential of religion. No forms of worship are binding, no statements of faith are final, no tradition even of spiritual experience is the last word. **Higher Criticism.**—The higher criticism of the Bible is welcome, as throwing light on the progressive expression of spiritual consciousness. **Science.**—Unitarianism finds no conflict between science and religion, holding that science is discovering divine truth and that it cannot contradict the truths of

religion. *God and Jesus.*—Unitarianism regards the inner experience of God as being an undifferentiated experience of one God; and it identifies the Divine Power of the universe with the God of inner experience. God was to Jesus an inner experience, and Jesus was fully obedient to the will of God. Thus Jesus was a man through whom men have learned much about God, and in whom they have seen an ideal of human life; but Unitarians do not regard Jesus as deity or one of the persons in a Trinity, but hold that the God in him is the one God of spiritual experience and the Invisible Presence of the whole world. Jesus is regarded as the highest expression of the religion of the spirit.

These important characteristics of Unitarianism are thus grouped around its supreme emphasis on God in the inner life of man. It is modernism in its most thorough form. The history of Unitarianism is best read in the light of its progress towards this end; for, putting aside outer compulsion, there is a general agreement in this position not only among individuals and churches in their voluntary associations but among the Unitarians of all lands.

Unitarians trace the history of the movement from the monotheism of Judaism through Jesus and the whole course of Christianity. They hold that when the religion of Judaism attained to the faith in a universal God, God was conceived as a single personality. They accept the teaching of the higher criticism of the Old Testament that there were two systems of religion: the "religion of the spirit" which the prophets taught, each prophet carrying the truth one step further as spiritual consciousness cleared; and the religion of outer forms, with the system of blood sacrifice, which came down from primitive times. They find in Jesus the greatest in the succession of the prophets of the religion of the spirit and hold that he believed in one God: they hold that Unitarianism is the religion of Jesus, laying great emphasis on the saying "Hear, O Israel, Jehovah our God is one, and thou shalt love Jehovah thy God with all thy heart . . . and thy neighbor as thyself."

They interpret Jesus as being in the succession of the prophets of the religion of the spirit and reject the idea that his primary purpose was to fulfill the sacrifices of blood; hence they reject the idea of a blood atonement, as they regard the sacrificial system of the Jews as an unworthy form of religion. Consistently with this they reject the doctrine of the virgin birth and of the resurrection of the body of Jesus, holding that it was his spirit which entered into immortal life. The miracles are not regarded as a setting aside of any law.

They hold that the faith in God's single personality was the common faith of the early church; that in the fourth century the Arians, who held this view, constituted nearly one-half of Christendom, and that it was only physical force which gave the trinitarian formula, a late invention, its hold on later centuries. It traces a continuity of the Arian faith, even in the face of persecution, through the whole course of Christianity.

Among the first expressions of that spirit which resulted in the Protestant Reformation was the Unitarian idea. It is impossible defi-

nately to separate the antipathy to the doctrine of the Trinity from the revolt against all ecclesiastical authority—authority which enforced that doctrine. At the same time, early in the Reformation period men who held the Unitarian theological position were persecuted and even martyred, e.g., Michael Servetus, who was burned at the stake in 1553, after more than 20 years of writing, by which he had stimulated thought in the direction of Unitarian doctrine. The translation of the Bible into the language of the European nations, the invention of the printing press, and the consequent multiplication of the copies of the Bible, making it easily accessible to the common people, had an enormous influence upon the course which the Reformation took. In the revolt against the authority of the church many of the reformers substituted the authority of the book, and thus created the position which several Protestant denominations of the present day hold. But from the very beginnings of the Reformation there were those who took distinctly the position of modern Unitarianism in regard to authority in religion, declaring that authority is in the inner life, conscience, reason, experience, spiritual intuition, and the voice of God speaking through these higher powers of the soul, and that over this life of the spirit no organization and no book can have absolute authority.

In the Unitarian movements of the Reformation period there are four important characteristics: first, the spirit of toleration; second, the minimizing of the importance of outer religious things as being nonessential; third, the repugnance to any formulated creed which could restrict the growing thought of man; and fourth, the historical study of Scripture and the right of human reason to judge of the spiritual value of the Bible or any part of it.

Martin Cellarius, 1499 to 1564, is commonly regarded as the first writer of the movement. He was a friend of Luther, but differed from him on this fundamental position of the authority of Scripture. A number of leading scholars of northern Italy met in 1546 at Vicenza and made a definite affirmation of Unitarian doctrines. They were persecuted vigorously, and those who were not killed fled to Switzerland, Transylvania, and Poland, scattering the seed of their thought far and wide. Socinus settled in Poland in 1579. In 1600 there were more than 400 Socinian churches in Poland. A printing press disseminated Unitarian views; more than 1000 students were gathered in a Unitarian college in Rakow. In 1658 persecution of these Unitarians began. Thousands died, other thousands fled, and in 1670 the organizations had been utterly obliterated in Poland, and Unitarianism ceased, except as it continued as the theological conviction and spiritual life of individuals and obscure groups.

In Transylvania and Hungary, Francis David was the first Unitarian Bishop. Persecutions broke out and Francis David was thrown into prison at Deva, and died in 1579. It was in Poland and in Hungary that religious communities were formed which took the definitely antitrinitarian position. In this and other lands the persecution which Unitarianism had to encounter was from two sources: Catholicism, against which the whole reformation movement was a revolt; and Protestantism, which still

held the doctrine of the Trinity, and also was gradually adopting the dogma of the authority of the Bible. Thus the Unitarian movement was caught between the upper and the nether millstone. In Hungary, Unitarianism was tenacious, and survived two centuries of bitter persecution. Though in 1791 religious toleration was decreed by the king, as late as 1857 a last effort was made to crush Unitarianism. At present there are 166 congregations, with 80,000 members. They have still a bishop, and the theological school, founded about 1556 by John Sigismund, is in Kolozsvár, where Francis David, the first bishop, preached so effectively. Four periodicals are published.

In England, from the period of the Reformation, Unitarian thought was at work, and the teachings of Socinus and Servetus were influential. Such men as John Milton, John Locke, and Sir Isaac Newton were Unitarians. The open expression of opinion and organization were checked by persecution. The last Christian martyrs in England were Unitarians. When in 1689 the Act of Toleration permitted the building of even orthodox nonconformist chapels, a number of English Presbyterian churches left their trust deeds open and gave freedom of theological opinion. This freedom was the atmosphere for the Unitarian emphasis on the religion of the spirit, and in time many of these churches became Unitarian in spirit and theology. In 1774 Theophilus Lindsey, on the denial of a petition of a group of clergy in the Church of England for latitude of opinion, left the church and went to London and established the first avowedly Unitarian church in England. Many existing churches grouped themselves in a new fellowship and new Unitarian churches were formed. In 1825 the British and Foreign Unitarian Association was formed and now includes about 400 churches in Great Britain and Ireland, with headquarters on the site of Lindsey's church in Essex Street. During the nineteenth century the leader of Unitarian thought in England was Dr. James Martineau, of Oxford.

The first seeds of Unitarianism in America are to be found in the spirit of the Pilgrims who went from England to Leyden, Holland, and thence to America. Their church in Plymouth had a spiritual covenant instead of a creed. That covenant, though brief, set forth the thought that the revelation of God's truth is a growing revelation. Other early churches in New England, notably the First Church in Salem, were similarly organized with a covenant instead of a creed. Through all the early life of the American Colonies the attitude of many of the churches was thus expressed. There was latitude within the same church for both Trinitarian and Unitarian opinion. There is a curious relation between the Wesleyan revival and the definite organization of Unitarianism in New England. In the early years of the revival George Whitefield worked with the Wesleys, but when Whitefield's thought led him into what Wesley regarded as extreme Calvinism, they separated. Whitefield went to New England, and there as a preacher of Calvinism stimulated the Trinitarian party in the Congregational churches to an intenser dogmatic expression. This was one of the influences towards the drawing of sharp lines of distinction between Trinitarian and Unitarian theology, forcing ministers and churches to decide that

they must choose the fellowship of one party or the other, and leading the two parties to organize as separate denominations. From 1785 to 1800 many of the Congregational churches took a distinctly Unitarian position, and these years were followed by decades of bitter controversy.

The first church in America to become definitely Unitarian was King's Chapel in Boston, which had been Church of England. In 1787 it excised the trinitarian phrases from its liturgy, and ordained James Freeman, avowedly a Unitarian. Joseph Priestley, the discoverer of oxygen, was driven out of England in 1794 by persecution for preaching Unitarianism, and established Unitarian churches in Philadelphia and Northumberland, Pa. In the same decades several other new churches distinctly Unitarian were organized. In 1805 Henry Ware, a Unitarian, was made professor of theology in Harvard; lines of division led to the establishment of the orthodox Andover Theological School (which, after just a century, moved to Cambridge and affiliated itself with Harvard). In 1819 Dr. William Ellery Channing of Boston preached the Baltimore sermon which contrasted Unitarianism and Calvinism so clearly that within a year nearly 150 of the New England Congregational churches declared their adhesion to Channing's position. Every church in Boston but one declared itself Unitarian in this period. Ralph Waldo Emerson and Theodore Parker were leaders of Unitarian thought. In 1825 the American Unitarian Association was organized, and there were in 1916 about 488 Unitarian churches in the United States. To James Freeman Clarke is attributed the authorship of the "five points of Unitarian faith" as contrasted with Calvinism: The Fatherhood of God, the Brotherhood of Man, the Leadership of Jesus, Salvation by Character, and the Progress of Mankind onward and upward forever.

The essential spirit of Unitarianism is incompatible with any narrow sectarian zeal; hence Unitarians have done more in public service than in building a denomination. In philanthropy, education, national life, literature, and other work for humanity the members of these churches have been conspicuous out of all proportion to their numbers. Among the poets, Bryant, Longfellow, Lowell, and Holmes; among educators, Horace Mann and C. W. Eliot; the Presidents, Thomas Jefferson, John Adams, John Quincy Adams, Fillmore, and Taft; statesmen, Sumner and Webster; in philanthropy the pioneer Tuckerman—are a few names from scores.

The International Council of Unitarian and other liberal religious thinkers and workers was organized in 1900 and has held congresses in London, Amsterdam, Geneva, Boston, Berlin, and Paris. Two thousand representatives of 30 nationalities and 60 religious communions have been enrolled.

The declaration of the Unitarian General Conference in America is "These churches accept the religion of Jesus, holding in accordance with his teaching that practical religion is summed up in love to God and love to man." The American Unitarian Association (Boston) is the executive organization and promotes religious education, social service, evangelism, publishing, building, and support of churches, and other enterprises. Unitarian ministers are trained in America at the Harvard Divinity

School (endowed by Unitarians), Meadville Theological School, Pacific Unitarian School for the Ministry (Berkeley); in England, Manchester College, Oxford, Unitarian Home Missionary College, Manchester; in Wales, Presbyterian College, Carmarthen; Hungary, Unitarian College, Klausenburg.

UNIT CHARACTERS. See MENDEL'S LAW.

UNITED AMERICAN MECHANICS, JUNIOR ORDER OF. A secret, patriotic, political, beneficiary society, formed in 1853 at Germantown, Pa., as a branch of the Order of United American Mechanics, to prepare young Americans for membership in the latter. It became an independent organization in 1885 without the junior age limitation as to eligibility for membership. It declared for restricted immigration, protection to Americans, the American flag on and the reading of the Bible in the public schools, and has the picture of the "little red school house" among its emblems. It pays sick and funeral benefits to members and their beneficiaries, more than \$10,000,000 having been so paid out since the society was formed. It has state or governing councils in 26 States, 2300 subordinate councils, and a total membership (1915) of about 236,000. Membership is most numerous in Pennsylvania, New Jersey, and nearby States. See SECRET SOCIETIES, PATRIOTIC-POLITICAL.

UNITED AMERICAN MECHANICS, ORDER OF. A patriotic, political, benevolent secret society, founded at Philadelphia in 1845, an outgrowth of the native American political agitation and disturbances of that period.

"Only native Americans or men born under the American flag" were eligible as members. The word Mechanics was used, apparently, symbolically. The society stands for the maintenance of the American flag on the public schools, opposition to union of church and state, offers aid to Americans in a business way, has a fund for the relief of widows and orphans of members, and opposes injurious competition from immigration. It is the parent of the Junior Order, United American Mechanics (q.v.), which has since become independent of the mother organization, which it greatly exceeds in number of members. It has governing or state councils in 17 States, 464 subordinate councils, and nearly 37,000 members. See SECRET SOCIETIES, PATRIOTIC-POLITICAL.

UNITED BAPTISTS. See BAPTISTS.

UNITED BRETHREN, THE. See MORAVIANS.

UNITED BRETHREN IN CHRIST, THE. A religious denomination which arose among the Germans of Pennsylvania, under the preaching of Philip William Otterbein (q.v.), an ordained pastor of the German Reformed church, and Martin Boehm, a preacher among the Mennonites. As their converts increased, laymen were licensed to preach. Their first formal conference met in Baltimore (1789), and their first annual conference at Frederick, Md., in 1800. Here their name was chosen, and Otterbein and Boehm were elected first bishops. The first General Conference met in 1815, when a Confession of Faith and a Discipline were adopted.

The organization of the United Brethren in Christ includes quarterly and annual conferences, and a quadrennial general conference, which is the only legislative body, and since 1901 has been composed of an equal number of ministers and laymen. The superintendency of the church is vested in the bishops, who, with the general church officers, are elected every four years by the general conference. Since 1889 women have been eligible to the ministry. All ordained preachers are elders, the only order recognized. Members are forbidden the use of intoxicating liquors, and must not traffic in them. Slavery was prohibited after 1821. Their theology is Arminian. They accept two sacraments, baptism and the Lord's Supper. The mode of baptism is left to the choice of the candidate. Infant baptism is practiced. The spiritually dynamic presence of Christ in the Lord's Supper is acknowledged. The practice of foot washing is discretionary. The government of the church is democratic. The itinerant system is enjoined, but pastorates are not limited as to time.

A commission appointed by the General Conference of 1885 prepared, without doctrinal change, a restatement of the Confession of Faith and a revision of the Constitution, which, having been approved by the members, was adopted and proclaimed by the General Conference of 1889. It provided for lay delegates to the General Conference and set aside a rule prohibiting membership in secret societies. At this time Bishop Milton Wright and 14 of the 125 delegates composing the conference withdrew and formed a branch of the church, which adheres to the former unrevised Confession of Faith and Constitution.

The larger division of the church, which accepted the new Constitution, had, in 1915, 39 annual conferences and mission districts, including

those in Germany, Japan, Ontario, West Africa, China, Japan, Porto Rico, and the Philippines, eight bishops, 2395 ministers, 341,845 members, about 448,975 pupils in the Sunday schools, 3556 church houses, and it contributed for all purposes \$3,102,871. It has a theological seminary at Dayton, Ohio, 10 colleges, and several academies. It has a publishing house at Dayton, and issues from its presses 26 different publications, aggregating over 10,000,000 copies annually. There are a Board of Education; Home, Frontier, and Foreign Missionary Societies; a Woman's Missionary Association, conducting missions in Africa, China, and the Philippines; a Church Election Society; a Young People's Christian Union; and a Historical Society. The combined missionary contributions for 1915 amounted to over \$200,000. The total value of property held by the denomination is over \$12,000,000.

The branch which retains the old Constitution had, in 1915, 32 annual conferences, 4 bishops, 310 preachers, 515 churches, 21,172 members, about 30,000 pupils in the Sunday schools, 540 church houses, and aggregate contributions amounting to over \$150,000. There are a Home, Frontier, and Foreign Missionary Society, sustaining missions in 16 conferences and mission districts, and a Woman's Missionary Association, a Board of Education, and colleges at Huntington, Ind., Albion, Wash., and in Oregon.

Bibliography. *The Religious Telescope* (weekly), *The Watchword* (weekly), and *The Year Book of the United Brethren in Christ*, besides missionary and Sunday-school publications, are issued by the New Constitution branch at Dayton, Ohio. The Old Constitution church issues *The Christian Conservator* (weekly), *The Missionary Monthly*, and a *Year Book* at Huntington, Ind. For the history of the church, consult also: L. Davis, *Life of Bishop David Edwards* (Dayton, 1883); A. W. Drury, *Life of Rev. Philip William Otterbein* (ib., 1884); id., *Life of Bishop J. J. Glossbrenner* (ib., 1889); Daniel Berger, *History of the Church of the United Brethren in Christ* (ib., 1897); E. L. Shuey, *Handbook of the United Brethren in Christ* (ib., 1901); H. A. Thompson, *Biography of Jonathan Weaver* (ib., 1901); M. R. Drury, *Life of Bishop J. W. Hott* (ib., 1902).

UNITED EVANGELICAL CHURCH, THE. A religious organization formed in 1894 as the result of a division which had occurred in the Evangelical Association (q.v.). A meeting attended by delegates from six annual conferences was held at Naperville, Ill., in November of that year, and constituted the first general conference of the United Evangelical church. The legislation necessary to perfect the organization of an independent church was enacted; a book of discipline was adopted, based upon the old discipline of the Evangelical Association, with certain changes, such as the introduction of lay representation into the conferences.

In 1914 the United Evangelical church had 10 conferences (including seven mission conferences), 975 organized congregations, 2 bishops, 528 preachers, 86,635 church members, and 85,000 pupils in Sunday schools. Besides assisting the seven mission conferences, the General Missionary Society has three missions in Honan, China; and the Woman's Missionary Society coöperates with it. The church raises about \$100,000 for missions yearly. A Church Extension Society was established in 1902. The educational institutions are Albright College,

Meyerstown, Pa.; Dallas College and La Creole Academy, Dallas, Oreg.; Western Union College, Le Mars, Iowa. Besides Sunday-school and similar publications the church periodicals are *The Evangelical* (weekly), *Die evangelische Zeitschrift* (weekly), and *The Missionary Tidings*, all issued at Harrisburg. Consult Ammon Stapleton, *Annals of the Evangelical Association of North America and History of the United Evangelical Church* (Harrisburg, 1900).

UNITED EVANGELICAL CHURCH, THE (IN GERMANY). A church established in Germany in 1817 by the union of portions of the Lutheran and Reformed churches. Such a union had been attempted without success in 1529, 1631, 1661, and by Frederick I of Prussia (1703-22). Frederick William I published several decrees having the same object in view. It was favored also towards the end of the eighteenth century by the progress of theological thought. Schleiermacher proposed to establish an outward church unity, leaving disputed points in scientific theology still open for discussion. At the tercentenary of the Reformation in 1817 a visible union was established, limited, however, at first, as many of its advocates supposed, to a common church government and a common celebration of the Lord's Supper. In this movement the government of Prussia has always been the leader, and the United Evangelical church is the state church there, although dissensions have arisen at various times. A similar union of Lutherans with the Reformed church has been accomplished in several other of the German states; while of the rest some are too exclusively Lutheran, and some too exclusively Reformed to warrant the attempt. In the United States a branch of the United Evangelical church was established near St. Louis in 1840. See GERMAN EVANGELICAL SYNOD OF NORTH AMERICA; also GERMAN EVANGELICAL PROTESTANT CHURCH.

UNITED FREE CHURCH OF SCOTLAND. See PRESBYTERIANISM AND THE PRESBYTERIAN CHURCHES.

UNITED IRISH LEAGUE OF AMERICA. An association of Irish-Americans which is practically the successor of the Parnell Land League and of the Irish Federated Societies in sympathy with the Land League Movement. It was provisionally established in New York, Dec. 4, 1901, and was ratified at the first National Convention of the United Irish League held at Boston, Oct. 20-21, 1902. Its purpose is to act as an auxiliary in America to the national organization in Ireland to secure its aims. These include self-government for Ireland, the abolition of landlordism there, and other reforms of political and economic conditions. Membership in the league is open to all Irish-American Nationalists without distinction of class or creed, and to all sympathizers with the national claims of Ireland. The general management of the league when not in convention is vested in a national committee, consisting of the president, two vice presidents, treasurer, and secretary, and 31 members at large. The national convention is held biennially or oftener at the discretion of the national committee.

UNITED IRISHMEN, SOCIETY OF. An Irish revolutionary society founded in 1791. It was an outgrowth of the sentiments inspired in Ireland by the French Revolution, which found earliest acceptance among the Presbyterians of Ulster, especially Belfast. Its object was to

obtain complete political emancipation of both Catholics and Dissenters and to reform the Irish Parliament. It soon spread among the Catholics of the south, and even members of the Established church joined the movement. The government in 1783 passed the Relief Act in the Irish Parliament. This gave the suffrage to Catholics, but did not qualify them for office. An attempted measure of parliamentary reform was, however, rejected in 1794, and the recall of Lord Fitzwilliam removed hopes of reform through parliamentary means. The society then became more revolutionary, collected arms and became to all intents and purposes a military organization. It promised confiscation of the land of hostile landlords to the peasants and sent emissaries to France for aid. Its numbers were greatly increased in the south by the action of the Orangemen of Ulster (Peep o' Day Boys) in expelling the Catholic inhabitants, who were forced to find refuge in the south. In 1796 Wolfe Tone (q.v.), the chief agent in the organization of the society, was sent to France for military aid, and an expedition of 15,000 troops under the command of Hoche (q.v.) was fitted out. A violent tempest prevented the French from landing and the expedition accomplished nothing. The society, nevertheless, remained ready for an invasion. Two directories were established, one in Belfast and the other in Dublin. They were reputed to have 200,000 recruits, but this was certainly an exaggeration. Meanwhile the government resolved to repress the movement before an invasion by France, and under the pretext of repressing disorder the leaders in Ulster were arrested, and the Protestant militia and yeomanry let loose on the population of the south. This irregular force committed great brutalities, it being evidently the intention of the government to incite the peasantry to open rebellion before preparations for a revolution could be completed. The rebellion broke out on May 3, 1798, and was confined to parts of Leinster. As it necessarily assumed the aspect of a religious war, the Presbyterians of Ulster took no part in it. The rebellion was suppressed before the arrival of the French, and shortly afterward Wolfe Tone himself was captured and was sentenced to be hanged but committed suicide. The constitution and oath of the society are printed in Plowden, *History of Ireland*, vol. iii (Philadelphia, 1806). Consult also *The Proceedings of the Dublin Society* (Philadelphia, 1795). The most complete work on the subject is R. R. Madden, *The United Irishmen* (Dublin, 1858). For a brief account consult Hassencamp, *History of Ireland* (London, 1888).

UNITED KINGDOM. The United Kingdom of Great Britain and Ireland is a constitutional monarchy, consisting of the islands of Great Britain and Ireland and various smaller adjacent isles, as the Hebrides, the Orkneys, the Shetlands, the Scilly Isles, Anglesey, and the Isle of Wight. The term "Great Britain" is often used to designate the United Kingdom, as is also the term "England" when the government rather than the country is in mind. The island of Great Britain, the largest island of Europe, with an area of 88,746 square miles, is divided into England (50,874 square miles), Wales (7466 square miles), and Scotland (30,406 square miles). Politically the Scilly Isles and the Isle of Wight are part of England, Anglesey of Wales, and the Hebrides, Orkneys,

and Shetlands of Scotland; their areas are included in the figures just given. The area of Ireland is 32,586 square miles. Thus the area of the United Kingdom is 121,331 square miles. The island of Great Britain lies between lat. 50° and 60° N. and is surrounded by the Atlantic Ocean or some of its divisions—the North Sea, English Channel, St. George's Channel, and Irish Sea.

Topography. The seas surrounding Great Britain are very shallow, rarely exceeding 300 feet in depth. The fact that the island stands on the continental shelf has two great advantages: (1) it is protected from the cold waters of the deep Arctic currents and thus is spared the chilling influences of the northern ocean; (2) the shallow surrounding waters are fitted in temperature and in abundant supplies of fish food to support myriads of the best varieties of fish.

The coasts are extremely long in proportion to the area of the land. Great Britain has 1 mile of coast to less than 20 miles of area. England has a coast line nearly 2000 miles in length, while that of Scotland is considerably longer. No part of the island is more than 70 miles from the coast. Two causes have contributed to increase the value of the numerous indentations as harbors. One is the subsidence or depression of the entire western side of the island, causing the sea to form drowned valleys; the other is the rise of the tides all around the coasts, from 6 to 30 feet, which converts the mouths and lower parts of many rivers into deep bays or channels. The deep-sea lochs of the west coast of Scotland are similar in appearance and origin to the fiords of Norway. Here, as on the west coast of England, all the softer rocks have been washed away; and on the Scottish coast there is left an outer barrier of islands and an inner wall of very hard rocks penetrated by these deep fiords. The east coast of Scotland, however, composed mainly of sandstone and clay, has been easily worn into deep estuaries at the mouths of rapid rivers like the Tay; and the east side of England, composed of soft rocks, has been worn into a low monotonous line of shore, broken only by the estuaries of rivers whose current is too sluggish to wear away deep channels. Most of the good harbors are therefore along the west and south shores of the island. The south coast is picturesque, with lofty cliffs and rocky shores dotted with summer resorts.

The highlands and lowlands of Great Britain may roughly be divided into four well-defined areas: (1) the Scottish Highlands, a mountainous and comparatively barren region, lie northwest of a line drawn from Dumbarton to Aberdeen; (2) the Scottish Lowlands, an expanse of fertile lowland, and the Southern Uplands, lie southeast of this line; (3) the mountains of England and Wales lie northwest of a line drawn from Exeter to Berwick; (4) the lowlands of England lie to the southeast of this line.

There are in the Scottish Highlands a number of parallel ranges of mountains, the highest mountain being Ben Nevis (4406 feet), the culminating point of the island. The only passageways are at their extremities. At these extremities are the two roadways through Scotland from south to north, the east coast forming the easiest and most traveled route.

The Scottish Lowlands, which connect the Highlands with the Southern Uplands, are a

plain, of the rift-valley type, diversified by many hills of hard igneous rocks, covered with fertile soil, and abounding with natural advantages that have concentrated in them most of the population of Scotland. The Southern Uplands, among which the Clyde rises, are a plateau where the heights are massed into different groups by the rivers that have excavated the valleys.

From the middle of England a broad peninsula (Wales) pushes out towards Ireland. The whole of Wales and the part of England lying to the northwest of the line from Exeter to Berwick are a highland. This hilly and mountainous region is composed of very old sedimentary rocks with masses of crystalline rocks at various centres. Thus the mountains have been partly weathered from the plateau surface into their present forms or were pushed up from below by terrestrial convulsion. The mountains are not so high as those of Scotland. It may be said of the island as a whole that it becomes lower and flatter as it widens out towards the south. The main direction of the mountain ranges of England and Wales is from north to south or from northeast to southwest, and they thus interpose no obstacles to communication with the Scottish Lowlands except among the Cheviot Hills, which, extending along the border, belong to Scotland more than to England and offer an easily protected frontier by which to maintain a separate political existence.

The Cheviot Hills are separated from the Pennine Chain by a low strip between Carlisle and Newcastle. The Pennine Chain is a succession of moors and hills of Carboniferous formation, the latter from 1000 to 2900 feet high, the backbone of northern England, extending south 150 miles and forming the water parting between east and west flowing rivers. The Cumbrian group of mountains, a region also known as the English Lake District, is in the northwest of England and is joined to the Pennines by the high moorland of Shap Fell. This ring of peaks, rising to over 3000 feet, is in its scenic aspects the grandest and most beautiful part of England. Its deep valleys have been eroded from the original high plateau of igneous and old sedimentary rocks, and in these valleys are the long narrow lakes that have made this district famous for its picturesque charm. The Welsh or Cambrian mountains, in which the Welsh tribes were long able to maintain an independent and separate existence, cover Wales and are mostly of very old sedimentary strata with crystalline rocks at various points. Unlike the Scottish Highlands, these mountains do not impart great ruggedness to the coast, because the rivers have brought down vast quantities of sediment, spreading it out into delta plains and largely filling the fiords that formerly existed. The high peninsula of Devon and Cornwall, forming the extreme southwestern extension of England, is the fifth and last feature of the highlands of South Britain. It is separated from Wales by the Bristol Channel, while another great depression on the south, the English Channel, severs it from Brittany, France, with which it is closely related in its crystalline and primary rocks, its high unfertile moorland, and its climate.

To the southeast of this great highland region extend the fertile lowlands of England, a coastal plain, less than 500 feet above sea level as a rule, comparatively flat, composed of younger sedimentary (Mesozoic and Tertiary) rocks, the

harder of which stand above the general level, forming several bands of higher ground, the oolitic and chalk bands being most prominent. The oolitic belt of higher ground extends to the northeast from Portland Bill in the south to Whitby in the north, forming, among the various elevations, the Cotswold Hills and the North Yorkshire moors, the latter (nearly 1500 feet in height) being the loftiest part of the plain region of England. Directly east of this Jurassic formation and extending parallel with it is the chalk country, whose ridges of hills form the Salisbury plateau, the Chiltern Hills, and other elevations. These chalk heights also extend along the south of England (the North and South Downs), and are seen in the white cliffs fronting the English Channel and abutting on the North Sea in the North and South Forelands. Between the North and South Downs the weald, a dissected dome, once heavily wooded, wedge-shaped, penetrates westward from the North Sea; and between the north-extending chalk lands and the North Sea extends the London Basin, low, remarkably fertile, whose coast is broken by several estuaries, among which that of the Thames is most prominent. One more distinctive feature, about midway on the east coast of England, is the marshy expanse of the Fenland, almost at the level of the sea.

Hydrography. The water parting is situated much nearer the west than the east coast, with the result that the larger number of rivers flow to the east; with the exception of the western Severn, the eastern rivers are the longest, and their basins larger than the western basins. As the eastern rivers of England flow sluggishly down the gentle slope of the coastal plain and drain the leeward slopes, it is natural that they should be least liable to floods and most important for navigation. Their value for commerce is somewhat impaired, however, by the fact that, crossing the softer rocks of the plain, they carry down a great deal of alluvium with which their mouths are often seriously clogged. The Tyne, Wear, and Tees of northeastern England have a course of only 70 or 80 miles, and their commercial importance depends upon the great coal fields (Tyne and Wear) and the iron and salt deposits (Tees) near them. The basin of the Humber embraces 10,000 square miles, from the mineral beds of the Pennine slopes through the rich agricultural plains; the Aire, Ouse, Trent, and other tributaries help to make it one of the most useful river systems in England. The Thames rises only 300 feet above the sea, but it has a long course of about 200 miles. Its sluggish current, its well-protected estuary, and the tides which carry numerous ocean vessels 50 miles up to London Bridge, help to make the Thames one of the largest commerce carriers among the world's rivers. The important western rivers of south Britain are limited to the Severn and the Mersey. The Severn is the longest British river (nearly 250 miles), with tides of extraordinary height, and empties through one of the largest and richest coal fields in Europe. It is navigable for a long distance and is a great commerce carrier. The Mersey is a short river, rising on the Pennine slopes and obstructed at its mouth by a shifting bar, but its proximity to a rich coal field and to the great manufacturing district of England gives it immense importance in commerce. The western rivers of Scotland, excepting the Clyde, are only short, torrential, and

commercially valueless streams; but the Clyde, artificially widened and deepened in its lower part at enormous expense, is the most important river in Scotland, and all the industries of the Lowlands and Southern Uplands—agricultural, mineral, and manufacturing—are represented in its trade. With this exception the longer and more gently flowing eastern rivers are most useful. The Tay, Spey, and Tweed are all about 100 miles, and the Dee and the Don about 80 miles long. The Tay and the Forth are great water highways, commanding all the river traffic passing through the eastern-central portion of Scotland. The two famous lake regions of Great Britain are in the Highlands of Scotland, where here and there in the valleys the rivers have spread out into long and narrow lakes, or lochs, which follow the curves of the hillsides and contribute much to the beauty and charm of this picturesque region, and the Lake District of the Cumbrian Mountains in northwest England, already mentioned.

Climate. Warm winters, cool summers, and large rainfall are the characteristics of the British climate. The island of Great Britain owes these advantages to the surrounding seas, which are unusually warm considering their latitude. The westerly winds (the southwest antitrades, or westerlies), blowing most of the time from off the broad expanse of the Atlantic, moderate the temperature of the winter months, mitigate the heat of summer, and cover the skies for a great part of the year with clouds which often hang upon the land as fog. Icebound harbors are unknown. There is no great variety of climate, because the country is not of great extent, and its surface, even to the mountain tops, does not reach a high elevation. The difference of summer temperature between the extreme north and south of the island is about 10 degrees. The copious rains which the westerly winds bring fall largely over the highland regions of the west, which makes them among the richest in rainfall of all parts of Europe; while the plains of the east receive a far smaller quantity of rain. All parts of the country, however, receive sufficient rain for agricultural needs; and the numerous valleys extending southwest and northeast permit the sea air to carry much moisture far inland before it falls as rain. The annual range of temperature is smallest in the west because it is more exposed to the influence of the Atlantic. The western regions have more sunshine than the plains, where cloud and fog are more prevalent. The average temperature of Great Britain for the year is 48° F. with extremes of 53° F. (Scilly Isles) and 45° F. (Shetland). Snow falls on the higher lands and sometimes covers most of the country, but no mountain is so high as to be snow-capped in summer. The islands are exposed to the great cyclonic storms which sometimes sweep in from the Atlantic.

Soils. Soils formed from the immediately underlying rocks are not the most common in Great Britain, and where they are so formed they are usually poor. Thus the hard crystalline rocks of the western mountains yield a comparatively poor soil; and the soil is not very fertile south of the Thames, where the local chalk and flint enter so largely into its composition. The very fertile soils of most of the plains, particularly north of the Thames, are the mixed components of many kinds of rocks ground up by glacial ice, carried a considerable distance and spread

over the surface. The rivers also, passing over many varieties of rocks, spread this mixed rock waste along their valleys, and these alluvial soils are very fertile. The soil of Scotland is naturally fertile, aside from mountain districts.

Flora. The native flora of Great Britain is almost identical with that of the neighboring portion of continental Europe; some mainland species, however, do not appear. In early times the island was almost completely covered with forests, but to-day little of the original woodlands remains, and only 3.6 per cent of the surface is covered with forests. The chief native trees are the oak and beech in the lower lands, and the Scotch pine and birch in the high and more northern districts. The great rainfall on the steeper mountain slopes has generally washed away the soil, showing the rock skeleton unrelieved by vegetation. On the gentler slopes of the Scottish and Welsh highlands, little except moss, fern, and heather can grow in the thin soil. All the cultivated plants that thrive in the lower lands have been introduced from the neighboring Continent and America. The mild, moist climate gives a peculiarly rich and fresh aspect to the vegetation. The pastures and hay lands are luxuriant, and the fields look like well-kept gardens.

Fauna. As the British Isles until geologically recent times were an integral part of the Continent, they partake of the general fauna of western Europe and present few differences except such as are due to man. All the larger animals were long ago exterminated (see *EXTINCT ANIMALS*), or have been preserved only as curiosities on private estates, with the exception of the red deer. Otters, badgers, polecats, and weasels survive free persecution; foxes persist under protection. The hare, squirrel, hedgehog, vole, some wild mice, moles, shrews, and bats nearly complete the list of remaining British land mammals. Seals of two or three species are found on the northern coasts, and the cetaceans of the North Atlantic visit the shores from time to time. Certain common animals of northern and western Europe, such as the reindeer, elk, roe deer, lemming, hamster, etc., have had no place in Great Britain within historic times; neither have several mammals of southern France.

The birds more fully represent the European air fauna, for the British Isles lie upon a path of coastal migration between tropical and northern latitudes. This brings regularly to Great Britain most of the European birds, but some species are exceedingly rare there which occur commonly in the Rhone-Rhine valley. Laws have long afforded protection to all birds, resident or migratory, preserving many species that were formerly threatened with extinction, yet some have been lost. The principal British birds are the raven, hooded and carrion crows, rook, jackdaw, magpie, chough, and jay—the last two becoming very scarce; the starling, the chaffinch, goldfinch, linnet, bullfinch, house sparrow, various buntings, and other seed eaters; the skylark and woodlark, with several related wagtails, pipits, etc.; a nuthatch and several varieties of titmouse, shrike, and waxwing. Thrushes are represented by the nightingale, blackbird, mavis, missel thrush, and redwing—famous songsters; and lesser insect eaters are the two chats, the wheatear, the redbreast, and several small warblers, accentors, wrens, flycatchers, etc. Several swallows are familiar about buildings and river

banks, and two or three woodpeckers. The cuckoo, nightjar, swift, and kingfisher, one species each, carry the list to the birds of prey. These include the brown, barn, and several other small owls, with the great snowy owl as a winter visitor. The osprey is rare. Among the falcons are the peregrine, kestrel, gerfalcon, merlin, and pigeon and sparrow hawks. Honey buzzards, kites, eagles, and vultures are seen only at long intervals, when they wander over from the Continent. The buzzards, goshawk, and marsh harrier complete a long list. Fishing birds are represented by cormorants, gannets, etc., on the coast, and by the bittern inland. Waterfowl include tame swans, the wild bernicle, greylag, bean, and pink-footed geese, and a series of ducks to a large degree identical with those of Canada. Four species of typical pigeons include the wild stock of domestic doves and the widespread turtle dove. The game birds are the capercaillie, blackgame, red grouse (one of the few birds peculiar to the British Islands), and the introduced pheasant; but sportsmen find a long list of visiting shore birds, most of which are known also in America; while the sea birds are those of the North Atlantic coasts generally.

Fish abound in the four seas about Great Britain, and their capture supports a large maritime population (see *Fisheries*); certain species, as the sole, turbot, and whitebait, are local and of wide repute for excellence. Salmon still ascend the northerly rivers of the Kingdom under legal protection, and trout, grayling, and various fresh-water fishes of interest to anglers are similarly preserved. Oysters and various other shellfish abound and are largely fished for or cultivated for food. Of reptiles, Great Britain contains but four—a small viviparous lizard, a blindworm, a small colubrine snake (*Tropidonotus natrix*), and the adder (*Helias berus*). Several frogs, two toads, and some newts comprise the amphibians. The insects, mollusks, and lower invertebrates are as numerous and varied as is usual in a mild and moist climate, and have been more thoroughly studied than anywhere else on the globe.

Geology. Great Britain may be roughly classified, from the standpoint of rock formation, into areas older than the coal measures and areas younger. The Highlands in the north and west are the remnants of the very ancient crystalline and sedimentary rock masses that were greatly disturbed in early geological epochs and have since been largely reduced in height and area by erosion. These regions of ancient rocks were subjected to much faulting and folding; and interspersed among them are areas which volcanic outflows, occurring in various ages and as late as Tertiary times, covered with igneous deposits that were also greatly disturbed by dynamical energy. These elevated lands are not marked by sharp and jagged peaks, but the mountains have been worn away into rounded outlines, and among them are interspersed a number of broad, plainlike moors broken here and there by more elevated masses of harder and particularly of eruptive rocks. The Highland regions may be compared in height with the Catskill Plateau and its surmounting elevations.

In sharp contrast with these ancient crystalline, sedimentary, and eruptive masses forming the Highlands are the younger rocks of the Lowlands, the widely distributed Old Red Sandstone of Devonian formation, the chalk and sand-

stones and the clays of the Carboniferous era. Towards the south and east of the old elevated rock masses are the Carboniferous strata containing the coal deposits which have contributed so much to the material greatness of Great Britain. None of the younger and lower lands has been much affected by faulting and folding. These lower lands extend from the mouth of the Tees to the south of the island, widening with their south extension till they cover the larger part of England, Exeter being their western limit on the south coast. They are mostly flat, trough-shaped, or rolling surfaces of the Triassic, Jurassic, Cretaceous, and Tertiary formations. The greatest diversity of surface and the finest scenery are thus in the north and west, while the lowest and most uniform surface is in the south and east. The extreme south of England escaped glacial action, but elsewhere many of the minor features of the land were produced by the ice sheet and glaciers of the Ice age. In scarcely any other part of the world is there so wide a range of geological strata in so limited an area as in Great Britain; only the broader aspects of the subjects are here indicated.

Minerals and Mining. The industrial history of the United Kingdom and its present position and outlook are intimately connected with the possession and exploitation of unusually abundant resources of coal and iron, particularly coal. They have largely determined the distribution of population (see *Population*) and have made possible the country's highly developed industrial life and extraordinary wealth. There was no mineral production on a large scale until the industrial revolution of the eighteenth and nineteenth centuries. Collieries were first opened at Newcastle in 1238, and the coal was shipped by sea to London and other towns on navigable rivers.

Early in the seventeenth century coal was used in smelting iron, but primitive mining methods, and particularly the lack of means for pumping water out of the mines, limited its use. The inventions of James Watt (c.1770) eliminated this difficulty and greatly increased production, thereby making practicable the blast-furnace method of iron smelting, which had already been introduced but was impeded by insufficient supplies of wood and coal. In the later years of the eighteenth century there was a constant succession of improvements—to wit, in mining, in the manufacture of iron, in internal means of communication—all facilitating increased production of coal and iron. The annual output of coal in the last years of the eighteenth century is estimated to have exceeded 10,000,000 tons. The introduction of the steamboat about 1812 and of the steam railway about 1830 created a new demand for coal and iron and made domestic and foreign distribution more practicable, thus enormously extending the market. Production increased throughout the nineteenth century, the average annual absolute gain continuing undiminished. The value of mining products aside from coal and iron is comparatively small.

The supremacy of Great Britain in total mineral product is the more remarkable since the product includes virtually neither gold nor silver. In 1820 Great Britain's coal production was two and one-half times as much as the rest of the civilized world, and as late as 1840 the iron-ore production was more than all other countries

combined. The United States first excelled Great Britain in mineral production in the latter part of the nineteenth century and is constantly increasing its lead. Great Britain's iron output was first surpassed by the United States in 1890 and its coal in 1899. The output of the British iron mines is insufficient for local needs, and increasing quantities, equaling in value that produced at home, are imported, chiefly from Spain; while coal for the whole period has been exported in increasing quantities. The export of coal, coke, and patent fuel increased from 46,098,228 tons in 1900 to 67,035,848 in 1912. Iron being much more easily imported than coal, Great Britain fares better than it would if the status of the production of the two minerals were reversed.

Coal and iron ore respectively have been produced in the United Kingdom as follows: in 1860, 81,000,000 tons and 8,155,000 tons; in 1870, 112,000,000 and 14,606,000; in 1890, 188,000,000 and 14,066,000; in 1900, 225,181,300 and 14,257,344; in 1910, 264,433,028 and 15,226,015. The following table shows for recent years the coal and iron produced in the United Kingdom and their values (in thousands of pounds sterling).

YEAR	COAL		IRON ORE	
	Tons	£1000	Tons	£1000
1895.....	189,661,362	57,231.2
1900.....	225,181,300	121,652.6
1905.....	236,128,936	82,088.6	14,590,703	3,482.2
1910.....	264,433,028	108,377.6	15,226,015	4,022.3
1913.....	287,430,473	145,535.7	15,997,328	4,543.6

About two-thirds of the coal is mined in England, the remainder being almost equally divided between Scotland and Wales. The principal productive districts, beginning at the north, are the Scottish Lowlands, or the neighborhood of Glasgow, the Newcastle district, the two fields on the east and west slopes of the Pennine Range in southwest Yorkshire, and to the southeastward and in eastern Lancashire, the Staffordshire fields farther south, and the South Wales field occupying Glamorganshire and parts of the adjoining counties. The third of these districts has the largest output. The output by districts was as follows in 1912:—in England: Durham, 37,890,404 tons; Yorkshire, 38,298,080; Lancashire, 22,790,472; Staffordshire, 13,698,357; Derbyshire, 16,573,157; Northumberland, 13,381,787; Nottinghamshire, 11,122,832; Monmouthshire, 13,391,742; other districts, 13,685,300;—in Wales: Glamorganshire, 33,727,100; other districts, 6,248,171;—in Scotland: Lanarkshire, 16,624,363; other districts, 22,894,266;—in Ireland, 90,307; total 260,416,338. Iron ore is obtained most abundantly in connection with the coal measures of Yorkshire and other regions. Red hematite ores are obtained in north Derbyshire and in Cumberland.

In mediæval and ancient times in Great Britain other varieties of minerals were relatively of much greater importance than coal and iron. According to tradition, centuries before the Christian era Phœnician merchants visited England and traded in the products of the tin mines of Cornwall. It is certain that the Cornish mines have been worked from a very early period. During the Middle Ages, down to

the time when the tin mines of Bohemia and Saxony were discovered, England supplied almost all the tin used in Christendom. Copper and silver were also mined. The revenue from the Devonshire tin and lead mines paid the expenses of the French wars of the fourteenth century. The great modern improvements in transportation have since made it more economical in many cases to import the ore. English clays have always been used in making pottery, especially after the introduction of improved methods by Dutch and Huguenot immigrants. The country's abundant supply of useful stone has always been drawn upon, increasingly so in recent years. In 1912 the total spot value of the metallic minerals produced in the United Kingdom was £5,211,746; of the nonmetallic minerals, £126,009,107; total, £131,220,853. Of the mineral output in 1912, the value of £88,897,556 was raised in England, £23,744,169 in Wales, £18,344,112 in Scotland, and £208,042 in Ireland; included in the total is £26,974, value of minerals raised in the Isle of Man. The following table shows the quantity of metal produced in the United Kingdom, from British ores (and, in the case of pig iron, also from foreign ores), with estimated value at the place of production.

ORE	1901	1906	1912
Pig iron,* tons.....	4,091,908 £12,826,622	5,040,360 17,623,966	4,451,636 16,419,298

Total.....	£25,893,195	37,151,247	33,945,790

* From British ores.

† From foreign ores.

In 1912 there were 3910 mines in operation, with 1,117,148 persons employed, of whom 895,485 were males working underground, and 215,001 males and 6662 females aboveground. In quarries 79,887 persons were employed.

Fisheries. The natural resources of the United Kingdom include very profitable fisheries. The herring fisheries off the Norfolk coast have always been important and were until the seventeenth century largely in the hands of the Dutch. But as the government fostered the fishing industry, the Dutch were supplanted, and to-day the United Kingdom is equaled only by the United States in the value of its annual catch. The value of the fish (exclusive of salmon) landed on the coasts of the United Kingdom, distinguishing the English, Welsh, Scottish, and Irish coasts, is shown on page 667. The herring fishery is the most important on both English and Scottish coasts. Its principal centre is Great Yarmouth. The North Sea fisheries yield shellfish, mackerel, and codfish. Sardine fishing is of some importance in Cornwall and Devonshire. Oyster fisheries are widely distributed along the coasts. Value for the United Kingdom of the principal catches in 1913: herring, £4,572,295; cod, £2,300,119; had-

dock, £1,891,005; hake, £678,981; soles, £474,127; whiting, £390,980; turbot, £302,411; skates and rays, £292,972; mackerel, £230,161. On Eng-

lish and Welsh coasts plaice were landed to the value of £1,051,016. At the end of 1912 there were registered in the United Kingdom 24,012 boats as engaged in fishing, giving employment to 98,894 persons, but there was also a large number of small craft not registered. In recent years the general tendency towards centralization in important industries has been very evident in the fishing industry, and the population engaged in fishing has centred to a large extent at a few important points, especially Great Yarmouth, Grimsby, Hull, and Peterhead.

Agriculture and Stock Raising. Compared to other industries agriculture is of far less importance in the United Kingdom than in any of the other great nations. The fact that the country is not producing sufficient food to supply

nate than its European neighbors as regards natural facilities for agriculture, having a smaller cultivable area and a soil of only moderate fertility. At one time an exporter of food products, the decline of the country's agriculture dates from the latter part of the eighteenth century, and though protected for a while by high import duties the repeal of the Corn Laws of 1846 opened the British market to foreign competition.

Foreign competition has caused a complete change in agricultural methods. A decided decrease in the production of grains, particularly of wheat, was followed by an increase in market gardening and the pastoral industries. The distribution of crops varies within the different sections, being determined largely by physical conditions. Mountainous districts in north and south Scotland, in western England, and in a large portion of Wales are unavailable for tillage, while there are extensive lowlands and swampy regions, which even with extensive drainage have not been entirely brought under cultivation. The subjoined table shows, accord-

its own needs makes the question of food provision one of great importance. It is less fortu-

not including foreshore and tidal waters) and the total cultivated area in Great Britain, in

Ireland, and in the United Kingdom, including the Isle of Man and the Channel Islands.

The share of England, of Wales, and of Scotland in the total cultivated area of the island of Great Britain is shown below.

LAND	England	Wales	Scotland
Total acres*	32,559,355	4,778,182	19,459,584
Cultivated, 1886-90.	24,960,192	2,842,616	4,895,715
1905....	24,611,186	2,794,661	4,880,985

* The figures here given do not exactly agree with the total for Great Britain in the preceding table on account of differing official calculations.

The area in acres under the principal crops, in the first week of June, is reported on page 667 (figures for the United Kingdom include those for the Isle of Man and the Channel Islands).

The true significance of British agriculture is not shown so much by the acreage as by the yield per acre. Intensive cultivation, application of modern scientific principles, and the liberal use of natural and artificial fertilizers cause the reluctant soil to produce unsurpassed quantities. Thus, while the area of cultivation has remained practically stationary, the product has constantly increased. (See ENGLAND; IRELAND.) The production of principal crops in Imperial bushels, long tons, or hundredweights, and the average yield per acre in 1912, were officially estimated for Great Britain and for Ireland as follows.

CROPS	GREAT BRITAIN		IRELAND	
	Production	Per acre	Production	Per acre
In bushels:				
Wheat.....	55,838,360	29.00	1,563,942	34.87

In hundredweights				
Hqps.....	373,438	10.72

* From clover, sainfoin, and grasses under rotation.

† From permanent pasture.

‡ Inclusive of beetroot.

Great Britain has originated many of the finest breeds of stock (see ENGLAND; SCOTLAND), the purity of which is zealously guarded. It is a noteworthy fact that the United Kingdom has more than half, and Great Britain almost exactly half, as many sheep as are found in the United States. The following table shows the

STOCK	Great Britain	Ireland	United Kingdom 1912*	United Kingdom 1900*
Horses...	1,441,023	544,332	1,994,607	2,000,415

Swine.....	2,083,226	211,479	130,214	1,164,316

The characteristics of British land ownership and tenure are, briefly, centralization of ownership, capitalistic tenants who pay money rent on long-time tenures, and a large laboring class who are on a low economic and social plane. Primogeniture has kept the large estates intact, and in 1876 two-thirds of the entire landed property of England and Wales was owned by about 10,000 individuals. In Scotland, in 1871, 42.1 per cent of the total area was owned by only 68 persons. The status with regard to ownership in Great Britain has not greatly changed, although some tendency in late years is to be noted among the agricultural laboring class to acquire small holdings as provided by recent parliamentary enactments.

Cultivation is in the hands of tenants, and renting therefore is well-nigh universal, as will be seen from the following table, giving the number of acres under crops and grass occupied by tenants and owners in 1912.

DIVISIONS	By tenants	By owners	Total
England.....	21,733,533	2,680,960	24,414,493
Wales.....	2,486,666	273,531	2,760,197
Scotland.....	4,346,209	475,125	4,821,334
Great Britain.....	28,566,408	3,429,616	31,996,024

Details of holdings of one acre and upward for 1912 are shown below, with average size in acres of holding in that year and in 1895.

DIVISIONS	No. of holdings	Cultivated acreage	Average size	
			1912	1895
England.....	374,809	24,414,493	65.1	65.3
Wales.....	61,077	2,760,197	45.1	47.1
Scotland.....	77,662	4,821,334	62.0	61.5
Great Britain.....	513,548	31,996,024	62.3	62.6
Ireland.....	521,345	14,673,778	28.1	*29.5

* 1896 figures.

The various sizes of these holdings in 1912 are shown in table on page 669.

While the average size of farms is comparatively small, the intensive cultivation makes the use of capital, machinery, etc., an economic advantage. The long-term renting system, where the tenancy often descends in the same family for generations, induces the farmer to improve his land rather than to exhaust it. By the Agricultural Holdings Acts of 1875 the tenant se-

cures compensation for whatever improvements he has placed on the land at the end of his tenancy. Laws passed in 1882, 1887, 1890, 1892, and 1894 provided that under certain conditions a demand in any locality for small holdings, either for rent or ownership, might be secured

DIVISIONS	1-5 acres	5-50 acres	50-300 acres	Over 300 acres
England.....	81,884	168,038	110,657	14,230

* 50-200 acres.

† Over 200 acres.

legally by compulsion if necessary. Under the Small Holdings and Allotments Act of 1908 and the Irish Land Act of 1903 the prospects of the agricultural laborer have been improved, and under the latter Act state advances are made to the tenants to purchase their holdings.

Manufactures. Until the recent industrial development in the United States no other nation had for more than a century approached Great Britain in the amount of manufactured products. But in the earlier periods of the nation's history manufacturing was of minor importance and did not begin to equal that of the Dutch, the Flemish, or the French. Chief among the factors which have brought Great Britain up from industrial insignificance to its present prominence are (1) its comparative free-

a great impetus to the old industry, but introduced new ones, such as silk weaving, the manufacture of cutlery, cloak making, and the manufacture of hats and pottery. A century later the revocation of the Edict of Nantes (1685) led to the emigration to England of a large number of French Huguenots, representing the most skilled artisans of France. In the latter part of this period manufacturing industry, which had early spread well over the east and west of England, developed extensively in the long-desolated region of the north.

Then came the great industrial revolution beginning in the latter half of the eighteenth century, due largely to the mechanical inventions which affected practically every branch of the manufacturing industry. (See INDUSTRIAL REVOLUTION.) The use of machinery, and especially its necessary installation in a single plant under the application of steam power, led to the factory system and the almost complete overthrow of the old domestic system.

Very significant, too, were the resulting changes in the location of the weaving industry. The textile machines were at first generally propelled by water power. The north region—Yorkshire and Lancashire—afforded superior facilities of this kind and consequently enjoyed a remarkable increase in textile manufacturing at the expense of the old centres farther south. Similarly the coal resources of the same region drew the iron manufacturing away from Suffolk and Norfolk when coal supplanted wood as a fuel. Birmingham, which had formerly depended upon the neighboring forests of Arden for the fuel used in its smelting industry, was

dom from wars, (2) its early superiority as a wool producer, (3) the favorable climate, (4) great abundance of coal and iron, (5) pre-eminence of shipping interests and the acquisition of territorial possessions in extending markets, and (6) improved methods and labor-saving inventions.

From a very early period Great Britain far excelled other Northern European countries in the production of wool. Edward III, near the middle of the fourteenth century, took advantage of internal troubles in Flanders and secured the migration of a considerable number of Flemish artisans to England. The woolen industry grew apace, centred chiefly in the towns of east England, but was not supreme until the Elizabethan period. The wars and persecutions on the Continent and the welcome by the English authorities resulted at this time in a great influx of Flemings, who not only gave

fortunately near enough to the new coal fields to place it at a great industrial advantage, and it has remained the largest centre of the iron industry. When steam power supplanted water power in the textile industries, the factories were no longer compelled to locate upon the streams and along watercourses. But as the coal supply was in the same district and the industry was otherwise favored there, as has been pointed out, it continued to develop in the north of England. Improved methods were applied first to manufactures of cotton and subsequently to woolens and linens.

The value of the annual cotton manufactured product in the United Kingdom was 100 times greater at the end of the nineteenth century than at the beginning. Before 1850 it had surpassed wool. The value of the annual woolen product was three, and linen five, times as great at the end as at the beginning of the century. Some

idea of the importance of these two products may be gathered from the figures of the increase of their exportation. (See under *Commerce*.) Lancashire is the largest centre of the cotton industry. Glasgow is another important centre. The woollen industry is largely confined to west Yorkshire. Both Ireland and Scotland exceed England in the production of linen. (See *ENGLAND*; *SCOTLAND*.) The manufacture of machines and metal ware is centred principally in north England, the different branches of this industry being largely localized in special districts. (See *ENGLAND*.) The Clyde district of Scotland leads the world in the building of ships. (See *SCOTLAND*.) Scotland and Ireland are noted for the manufacture of whiskies, and England has a very large brewing industry. (See *ENGLAND*; *IRELAND*; *SCOTLAND*.) The table on page 669 is a summary of the census of production of 1907. See also *FRIENDLY SOCIETY*; *TRADE-UNIONS*.

Transportation and Communication. Prior to the industrial revolution (see *Manufactures*) inland transportation was much inferior to that in other European countries. As early as 1423 the English government began the improvement of the Thames River and other natural water-courses for purposes of navigation. The latter part of the eighteenth and the early part of the nineteenth century were periods of remarkable development in the construction of canals, then industrially important. With the advent of railroads the canals were partly superseded. However, the ship canals are quite important, as the largest and most famous of which, the Manchester Ship Canal, from Manchester to the Mersey port of Liverpool, was only completed in its present form in 1894. The Gloucester and Berkeley and the Exeter canals are also ship canals of some importance, and the Thames, Severn, Aire, and Weaver rivers are canalized. Bearing this and the insularity of Great Britain in mind, its inland shipping facilities are remarkable. In 1915 there were about 4700 miles of canals in the United Kingdom, of which 3640 were in England and Wales. The tonnage carried in 1905 amounted to 43,161,927.

Another method of meeting the demands of a growing industry upon transportation was the turnpike. Tramways have since about 1700 been used at the mines, and about 1800-05 one was constructed from Wandsworth to Croydon and Reigate. Shorter ones were completed in other parts of the country. Finally, in 1825 a railway line that was operated by steam, 14 miles in length, was opened for passenger traffic from Stockton to Darlington. The first important railway line in the world, that from Liverpool to Manchester, was opened in 1830. (See *RAILWAYS*.) The mileage for the United Kingdom in 1850 was 6620; in 1870, 15,540; in 1900, 21,855; in 1912, 23,441. Of the last amount 16,223 miles were in England and Wales, 3815 in Scotland, and 3403 in Ireland. London is the focal point for the principal lines of England. The increase in the number of passengers conveyed (exclusive of season-ticket holders) is indicated in the table in the next column.

In 1905 the tonnage of minerals conveyed was 358,076,000, and of general merchandise 103,063,000; in 1912, 401,564,000 and 118,715,000. The combined capital of all the railways greatly exceeded the national debt in amount. In 1912 the total gross receipts of the railways of the United Kingdom were £128,553,417; working ex-

penses, £81,224,343; net receipts, £47,329,074; proportion of working expenditure to gross receipts, 63, as compared with 62 in 1905 and in 1900. There are many small lines, but these are nearly all operated by one of the large companies. Of these, the Great Western has the

YEAR	England and Wales	Scotland	Ireland
1862.....	152,437,000	17,610,000	10,436,000
1880.....	540,669,000	45,956,000	17,259,000
1900.....	992,426,000	122,201,000	27,650,000
1905.....	1,054,416,000	115,580,000	29,026,000
1912.....	1,161,993,000	103,182,000	29,162,000

greatest mileage, the largest tonnage of goods is booked by the North Eastern, and the largest number of passengers is carried by the Great Eastern. Parliament recognizes nothing in the nature of a vested interest as attaching to railways, and privileges granted may be withdrawn when they cease to be consistent with the general advantage. No official step has been taken towards government ownership. A railway commission of three members has final decision in questions of fact that arise in the administration of the railways. Their decisions on questions of law are subject to appeal.

Curiously enough, the tramways, which, as we have seen, antedate the railway, went into disuse when the railways developed, and it was only about 1870 that they were successfully reinstated in the form of street railways, on the model of the American system. They have not yet become nearly so common as in the United States, carriage transportation still being mainly depended upon in the cities. In 1905 the mileage of tramways and light railways in the United Kingdom was 2177, about two-thirds belonging to local authorities; in 1912, 2642. The necessity for some means of rapid transit to meet the needs of agricultural and other interests not served by the regular system of railway transportation resulted in the construction of light railways during 1885-1900. The greater part of these lines are modeled after the ordinary railway, while the remainder are nearer to the type of the American interurban street railways.

The United Kingdom has highly efficient postal and telegraph services, both of which are in the hands of the government. The postal system was revolutionized by laws of 1837 and 1839, the penny postage for letters being established in 1839. The revenue from the postal service exceeds the expenditure by nearly £5,000,000 annually. A parcel post, run in connection with the post-office system, has largely supplanted private express companies in the carrying of light packages to all parts of the Kingdom. Postal savings banks and a system of life insurance are connected with the postal system. (See *Savings Banks*.) During 1868-70 the government assumed the ownership and control of all telegraph lines in the United Kingdom and made them a part of the post-office system. The charges for service were greatly reduced, with a consequent enormous increase in the number of messages sent. Telegrams may be sent to any part of the United Kingdom for 6d. for the first 12 words and 1 halfpenny for each additional word. The operation of the telegraph service creates a large deficit each year.

The government also developed the policy of purchasing and controlling the telephone lines as a part of the post-office system. During 1892-

97 all the main lines were acquired, but a private company still had a monopoly of the local or town lines. In 1899 the government began to compete with the lines inside the towns, and on Jan. 1, 1912, took over these lines, which had been amalgamated into the National Telephone Company. Great Britain is connected with Ireland by a large number of submarine cables and thence with America, and there are several cables connecting with the continent of Europe.

Commerce. The industrial supremacy which the United Kingdom has so long enjoyed has probably been most manifest in its commerce. The protection and expansion of trade are the hopes of the British manufacturer and are the secret of British colonial expansion and zeal in maintaining a naval supremacy. In acquiring and maintaining this position Great Britain has perhaps more natural conditions in its favor

markets. From 1782 to 1792 the trade increased in value from £23,300,000 to £44,500,000, and by 1810 it had reached a value of £82,870,000. In 1780 the East Indian trade formed but one thirty-second part of the total foreign trade; but after the abolition of the monopoly feature of the rights of the East India Company as applied to India in 1813 and later in China, this commerce rapidly increased.

Commercial treaties tending towards free trade were concluded with various powers, and finally (1846) an out-and-out free-trade policy was adopted. The development of the commerce of the United Kingdom during the last half century is indicated in the following table, which shows total imports of merchandise; net imports, i.e., total imports less reexports; exports of United Kingdom produce and of foreign and colonial produce; and total exports of merchandise.

YEAR	IMPORTS		EXPORTS		
	Total imports	Net imports	United Kingdom produce	Foreign and colonial produce	Total exports
1862.....	£225,716,976	£123,992,000	£42,175,000	£166,168,134
1880.....	411,229,565	223,060,000	63,354,000	286,414,466
1895.....	416,689,658	226,128,246	59,704,161	285,832,407
1900.....	523,075,163	£459,893,405	291,911,996	63,181,753	354,373,754

1913.....	708,734,739	659,159,702	525,245,289	109,575,037	634,820,326
1914.....	696,635,113	430,721,357	526,195,523

than any other country. An island off the west coast of Europe, it was free from the disturbing international conflicts that afflicted continental trade centres. The importance of its strategic central position increased with the growing commercial importance of the Western Hemisphere. Again, Great Britain has been favored by her coast line. She is favored also by her abundant natural resources, the energy, ingenuity, and perseverance of her people, her democratic institutions, and the activity of the government in fostering and protecting trade interests.

The supremacy of English commerce is, however, of comparatively recent times. Until the reign of Queen Elizabeth the trade of England had been almost wholly in the hands of foreigners. The fostering of English commerce and shipping was one of the expedients devised to help in the acquisition of precious metals; for, according to the mercantilists of that era, increase in trade would result in the natural inflow of metals. Trading companies were encouraged by the granting of monopolies. Though at this stage competition in both East and West was very great, England succeeded in extending its trade, the total for imports and exports increasing from £4,628,000 in 1613 to £12,428,000 in 1699. Out of trade rivalry grew the Navigation Laws of Cromwell and subsequent acts, which tended to limit colonial trade to English or colonial vessels and greatly restricted colonial manufactures with a view to fostering English trade and shipping interests and extending the market for English goods. The policy operated with great severity against both Scottish and Irish trade and industries. The union of Scotland with England in 1707 and the establishment of free trade between the two greatly benefited British commerce. Through the wars of the eighteenth century Great Britain extended its colonial territory and thereby broadened its

From this it will be seen that the imports were increasing faster than the exports. The United Kingdom had the largest imports and exports in the world, Germany and the United States standing next.

Prior to the reign of Elizabeth wool constituted the bulk of English exports, while manufactures of wool and other products constituted most of the imports. But soon England became a shipper of wool manufactures, and these became the leading export. Later, with the great development in sheep raising in British colonies, wool came to be extensively imported, and the manufactures and exports thereof greatly increased. The exports of woolen and worsted manufactures and yarn amounted to £31,386,355 in 1906 and £37,773,504 in 1912. Cotton manufactures did not figure among exports before the industrial revolution. But in 1802 they exceeded the exports of woolen goods and rapidly increased until they were three times the value of the latter and made up the largest single item of exportation; in 1906 the exports of cotton yarn and manufactures amounted to £99,598,915 and in 1912 to £122,219,939. Raw cotton likewise became the greatest item of importation. At first cotton was obtained from Brazil and the West Indies, but during the nineteenth century the bulk of it was supplied by the United States, although Egypt now shares largely in the supply. Cotton imports from India, which became prominent during the Civil War in the United States, are now of minor importance. (See INDIA.) About 1800 the exports of metal products were still small, but they rapidly increased. In 1907 the exports of iron and steel and their manufactures amounted to £46,563,386 and in 1912 to £48,597,677; hardware, cutlery, etc., in 1912 amounted to £8,108,878; and machinery in 1907 to £31,743,253 and in 1912 to £33,158,015. As British iron mines become more difficult to work,

and superior ores are found elsewhere, imports of iron ore may be expected to increase. Imports of iron ore and scrap in 1912 were valued at £6,219,050. The aggregate of other metals exceeds iron in import value, but is much less in export value. The value of coal exports doubled during 1891-1900, being £36,409,614 in 1900 and ranking next to cotton manufactures. The coal export declined in value to £24,859,129 in 1905 and then rose to £40,494,274 in 1912.

The preponderating increase of British imports over exports is due largely to the returns from the enormous foreign investments and the profits accruing from the carrying trade. The imports of grain and flour increased in value from about £34,000,000 in 1870 to £69,200,285 in 1905 and £88,496,284 in 1912. Of the grain articles wheat constituted over half the total in 1912, about one-half of which was from the United States. Corn is next in importance. The imports of meats and animals for food amounted to £49,431,748 in 1905 and to £49,079,559 in 1912. Sugar originally came almost wholly from England's West Indian possessions, but the bounty-produced beet sugar of the Continent has taken its place. Tea, wheat, and jute are the principal imports from British India, and wheat and lumber from Canada. Gold is the leading import from the British South African possessions, and it is also extensively imported from Australia.

The following table shows the value of merchandise consigned from and to foreign countries and British possessions in 1904 and 1912, in thousands of pounds sterling; imports for consumption, or net imports, are discriminated from total imports, and domestic exports, or exports of United Kingdom produce and manufacture, from total exports:

CLASS	Total imports		Net imports	
	1905	1912	1905	1912
From foreign countries	438,368	558,627	395,677	503,174
From British possessions	126,652	186,013	91,616	129,800
Total*	565,020	744,641	†487,240	†632,903
	Total exports		Domestic exports	
	1905	1912	1905	1912
To foreign countries	284,050	407,418	215,599	310,131
To British possessions	123,547	191,543	114,217	177,093
Total	407,597	598,961	329,817	487,223

* Exclusive of the value of diamonds from the Union of South Africa.

† Re-exports in excess of imports to unknown countries were about £53,000 in 1905 and £71,000 in 1912.

Trade with the principal countries in 1905 and in 1912 is shown in the following table, in thousands of pounds sterling; the import figures indicate the net value of merchandise consigned to and retained in the United Kingdom; the export figures indicate the value of the produce and manufacture of the United Kingdom consigned abroad.

Shipping. British expansion is due largely to British shipping. British shipping expansion dates from the time of the mercantilists. (See

Commerce.) The Navigation Laws of the seventeenth century were intended to give English vessels a maximum of the carrying trade. Fishing was encouraged and trained men in a seafaring life, and great pains were taken with marked success by the government to develop skill in shipbuilding. Naval victories in the Napoleonic wars gave British vessels almost a

* Including Formosa.

† Exclusive of Hongkong, Macao, and Weihaiwei.

complete monopoly in the world's carrying trade. About that time, however, British shipping met a formidable rival in the American merchant fleet. Favored by superior forest resources, the American fleet developed very rapidly, until its tonnage in 1860 almost equaled that of the United Kingdom. The American Civil War and the change from wood to iron in shipbuilding resulted in greatly benefiting British shipping and almost ruining that of the United States.

In 1913 American tonnage was about two-thirds as large as British, but most of the British shipping was in foreign trade and very little of the American. Over 50 per cent of Chinese external trade is carried in British ships, and they hold foremost rank also in Japanese over-sea trade. Two-thirds of the tonnage passing through the Suez Canal is British. Registered vessels employed in the home and foreign trade in 1912 (not including vessels employed on rivers and in inland navigation): 3386 sailing vessels, of 569,038 tons net, and 9672 steamers, of 11,145,160 tons; total, 13,058 vessels, of 11,714,198 tons. In 1900 there were 7480 sailing vessels, of 1,989,731 tons, and 7455 steamers, of 7,405,476 tons; total, 14,935 vessels, of 9,395,207 tons. Persons employed in 1912, 286,806; in 1900, 247,448.

Shipping has been greatly facilitated by river and harbor improvements, as, e.g., by the broadening of the river Clyde to Glasgow and the construction of the Manchester Ship Canal. London receives and distributes the greater portion of the Continental and Oriental trade. Cardiff, as a result of its growing exports of coal, is now next to London and Liverpool in the amount of its annual shipping tonnage. Liverpool, ranking next to London, is favored by its position for the trade with America. Other important ports are Newcastle (with North and South Shields), Hull, Grimsby, Leith, Glasgow, Southampton, and Cork (including Queenstown).

Banking. Banking was introduced into Great Britain by the goldsmiths of London in the seventeenth century. The banking systems of England and Scotland have developed independently and naturally along somewhat divergent lines. In England the first connection of the government with banking occurred in 1694, when the financial exigencies of the nation made necessary the advancement of a loan, and the Bank of England was chartered in order that a loan might be secured. This bank, through special privileges granted it by the government—as, e.g., the management of the national debt, the position of being the bank of the government, and until 1826 of being the only joint-stock bank in England, and the power to issue notes—has attained an overshadowing prominence among the banks of that country and among the banks of the world. The monopoly rights implied restrictions on other banks, so that provincial banking in Great Britain is generally admitted to have been inadequately provided for. The Bank of Scotland was organized one year later (1695) than the Bank of England, and it, too, at first (for 21 years) enjoyed monopoly rights; but, unlike the English bank, it did not secure a renewal of its patent rights. This gave an opportunity for the growth of other banks, which have coöperated to secure a uniform system of banking throughout Scotland. The formation of joint-stock companies was also permitted with liberal privileges in respect of note issue. The authorized note issues of Scottish banks may be exceeded, providing there is a specie reserve equal in amount to the excess of the issues—a precaution which, of course, strengthens the circulation. This reserve is considered as part of the cash balance of the bank. The Scottish banks do not lose their rights of issue in Scotland when they open offices or branches in London or in the English provincial towns. In England laws were passed in 1826 which admitted the establishment of joint-stock banks beyond a radius of 65 miles from London, the number of partners not to exceed six. This number was increased in 1862 to 10, except for banks of issue; the latter are still limited to six.

By the Bank Charter Act of 1844 the issue department was separated from the banking department of each bank, and the issue of bank notes was limited to those banks already exercising that privilege. These institutions were restricted to a fixed issue, and if they established themselves within a radius of 65 miles from London they forfeited their rights to issue notes. Under these laws the number of note-issuing banks is decreasing, and this function will probably become the exclusive right of the Bank of England unless the laws are changed. The Bank of England notes are legal tender for all sums over £5 except at the bank and its branches and in Scotland and Ireland. The English and Scottish bankers pursue different policies in matters of interest and commission, the English being inclined to cut rates and to underbid for business, while the Scottish adhere to uniform terms in accordance with an agreement between them. The policies also differ in respect of the dependence placed upon different sources of profit. In England the directors have more to do in the management than in Scotland, while in Scotland the agents play a more important part than in England. The Scottish bankers have become famous for the perfection attained in bookkeeping methods.

In 1827 there were 465 private and 6 joint-stock banks in England and Wales; in 1905 the private banks had decreased to 12 and the joint-stock banks had increased to 62. In 1914 there were 44 English joint-stock banks with 5802 branches. In Scotland there were in 1914 only 9 banks (all joint-stock), with 1240 branches. In December, 1914, the Bank of England (banking department) had capital and "rest" amounting to £17,830,000; deposits and post bills, £155,190,000; securities, £121,050,000; notes in reserve, £51,340,000. In the issue department, notes issued, £87,480,000; securities, £18,450,000; gold coin and bullion, £69,030,000. The English joint-stock banks at the beginning of 1914 had paid-up capital, £63,023,000; reserve funds and undivided profits, £41,618,000; notes in circulation, £29,735,000; deposit and current accounts, £880,694,000; cash in hand and at call, £270,941,000; discounts, advances, etc., £591,937,000; total assets, £1,081,821,000; total liabilities, the same. The Scottish joint-stock banks had paid-up capital, £9,241,000; reserve funds and undivided profits £9,243,000; notes in circulation, £7,744,000; deposit and current accounts, £125,887,000; cash in hand and at call, £3,961,000; discounts, advances, etc., £77,764,000. The Irish joint-stock banks had the corresponding figures: £7,309,000; £4,283,000; £8,074,000; £70,657,000; £17,189,000; £48,600,000. The colonial and the foreign joint-stock banks with London offices have added largely to the total banking business of the Kingdom.

Savings Banks.—A savings bank was established in Scotland in 1810, and soon after such institutions became established in different parts of Great Britain. Under the Law of 1817 and subsequent laws these banks were placed under the regulation of the government, and during the second quarter of the nineteenth century they enjoyed a rapid growth. The deposits of these banks are turned over to the Bank of England, which allows a specified rate of interest upon them. The rate of interest paid depositors varies, but is in excess of that ordinarily paid by banks to their depositors. The trustees are prohibited from receiving any profits. The growth of the old, or trustees, savings banks was checked by the establishment of the postal savings banks.

The scheme for the operation of postal savings banks went into effect in 1861. Deposits, including interest, have a maximum limit of £200. Depositors cannot deposit more than £50 in any one year. Two and one-half per cent interest is allowed on deposits. The depositor may withdraw his money at once through any postal savings bank in the United Kingdom. The number of depositors in the postal savings banks increased from 2,184,972 in 1880 to 9,673,717 in 1904 and 13,198,609 in 1913; and the amount they invested increased from £11,079,137 in 1880 to £44,108,600 in 1904, and to £55,541,010 in 1913. The number of depositors in the trustees savings banks also showed an increase during the before-mentioned period, being 1,519,805 in 1880, 1,704,766 in 1904, and 1,912,816 in 1913. The amount invested in the latter banks amounted to £9,008,315 in 1880, £12,560,322 in 1904, and £14,284,386 in 1913. Penny savings banks and special savings banks for soldiers and seamen have been established. The granting of annuities and the insuring of lives are also provided for through the postal service. See WAR IN EUROPE.

Finance. The ordinary expenditures incurred in the maintenance of the national government are increasing rapidly, necessitating a correspondingly greater national income. The following table shows the revenue and expenditures for years ending March 31.

YEAR	Revenue	Expenditures
1895.....	£101,697,304	£100,931,963
1900.....	129,804,566	143,678,068

* Exclusive of fee and patent stamps.

† Receipts from Suez Canal shares and sundry loans.

† Net receipts.

§ Including fee and patent stamps.

For the same years the expenditure (exchequer issues), under the principal heads thereof, was as follows (the figures in parenthesis show items in the principal head preceding).

In the following table the figures for interest of funded debt and for new sinking fund are

included in those for national debt services; the figures for law and justice, for education, and for charitable services are included in those for civil services. The table discloses the great burden of the national debt and the rapid increases in recent years for the army, the navy, education, old-age pensions, and the post-office services (which include telegraphs and telephones).

As a result of the changed tariff policy, customs duties are relatively less important than in the middle of the nineteenth century, although they have almost held their own absolutely. Collections from excise duties, on the other hand, have about doubled during the same period. The death duties and income tax have latterly become very important sources of revenue.

The British budget is noted for its adjust-

‡ Includes for road-improvement fund £1,172,205 in 1913 and £1,394,951 in 1914, not shown in table.

cause of the reduction of the corn (grain) taxes. The income tax has now become a permanent feature in the national budget. Incomes not exceeding £160 are exempt from the tax, and the moderate incomes, or those below £700, are favored by abatements. The income tax is made to fluctuate more or less as the annual exigencies of the budget may demand. The income-tax rate has gradually increased from 2d. per pound in 1874, until in 1913 it ranged from 9d. to 1s. 2d. in the pound. Like the income tax, the death rates favor the masses. The most important fiscal change made during 1875-1900 was the readjustment of the death rates in 1894 so as to increase them and extend their application to all the estates probated, thus adding greatly to the returns of the tax. The most important of this class of taxes are the estate duties and the legacy duties. Since 1851 there has been an inhabited-house duty (levied in Great Britain only), taking the place of the old window tax assessed prior to that date. This tax is not levied upon property rented for less than £20 per year, thus exempting the houses of the working classes.

In 1840, before the introduction of the free-trade policy (the sweeping Corn Laws were passed in 1846, and the policy became fully operative about 1860), 1046 articles were taxed. In 1913 the number had been reduced to 21 articles (or classes of articles; the category sugar, e.g., includes many confections). The articles now taxed are those not produced in the United Kingdom or such as are considered luxuries. The latest article in the category of necessary products, sugar, was placed upon the free list in 1874, but the exigencies of the South African War led to the reimposition of a duty upon sugar, the raising of the duty upon tea, tobacco, spirits, and beer, and the assessment of an export duty on coal. This last was discontinued in 1907. Tobacco and tea are the chief customs revenue producers, yielding respectively, in the fiscal year 1913, £17,254,125 and £6,151,879. Other dutiable articles are spirits, wine, beer, coffee, currants, raisins, and cocoa. The principle of protection is generally considered to have been wholly abandoned in the British revenue policy, but the tariff is still in a limited way highly protective and is shaped expressly to aid British manufacturers. Thus a distinction is made between raw cacao and the manufactured cocoa, roasted and unroasted coffee, manufactured and unmanufactured tobacco; and the distinction is sufficiently large to guarantee the importation of the raw products and render possible the prosperity of the home industries based upon them. In 1913 the import duty on unmanufactured tobacco was from 3s. 8d. to 4s. 1½d. per pound and on manufactured tobacco from 4s. 8d. to 7s. per pound; the 7s. duty was for cigars. Raw coffee was taxed at 14s. per hundredweight, while kiln-dried or roasted was taxed at 2d. per pound. The tea duty was 5d. per pound. The foregoing applies to conditions existing before the great war which began in 1914. The enormous additional revenue required for the war made necessary the imposition of import and export duties on many articles. See WAR IN EUROPE.

The British fiscal system applies uniformly to England and Wales, Scotland, and Ireland, but Ireland is exempt from the land tax and the inhabited-house duty. The burden of the indirect taxes is relatively much heavier in Scot-

land and Ireland than in England. The income tax had a total net produce of £18,828,958 in the fiscal year 1900, £30,966,404 in 1905, and £41,574,277 in 1913. The latter amount was derived from a total income of £755,577,547; the total income brought under the review of the inland-revenue department for the year was £1,111,456,413, of which the share of England and Wales was £970,093,437, Scotland £99,884,044, and Ireland £41,478,932. Of the total revenue in the fiscal year 1913, about 81.8 per cent was contributed by England and Wales, about 10.6 per cent by Scotland, and about 5.7 per cent by Ireland.

The local taxes are annually supplemented by appropriations from the Imperial revenues. The levying and collecting of the local rates are in the hands of the elected local overseers, the valuation list being made to include every class of property. The rates for real property are based upon the annual value of the property as determined by the amount it will rent for. The town councils, boards of guardians, and school boards are the local spending bodies. In recent years local expenditure and indebtedness have increased rapidly. British municipalities have become noted for their activity in assuming the ownership and control of productive properties, oftentimes receiving the net revenue from this source.

National Debt. The United Kingdom sustains the burden of a heavy debt which is exceeded only by the debts of France and Russia. The beginning of the debt dates from the reign of Charles II and in 1688 amounted to £664,263. The wars of William III raised it to £12,767,225, and by the commencement of the American war in 1775 it had increased to £126,842,811. The war with the American Colonies almost doubled this figure, leaving it in 1784 at £243,063,145. This was followed by the enormously expensive Napoleonic wars, which augmented the debt until in 1815 it was £861,039,049. At the commencement of the Crimean War in 1854 it had been reduced to £804,226,354, and at the end of that war it stood at £836,144,597. From that time it decreased until 1899; at the end of that fiscal year it stood at £628,021,572. The expenditure for the Boer War raised it again until it reached £770,778,762 in 1903. It declined to £702,687,897 in 1909, rose to £713,245,408 in 1910, and declined to £661,473,765 at the end of the fiscal year 1913. The figure for the debt in 1913 included: nominal amount of funded debt, £593,453,857; estimated capital liability in respect of terminable annuities, £31,519,908; unfunded debt, £36,500,000. In addition to this debt of £661,473,765, there were capital liabilities in respect of sums borrowed under various acts amounting to £54,814,656, so that the aggregate gross liabilities of the state were £716,288,421 (as compared with £798,349,190 in 1907 and £635,393,734 in 1899). The debt services for the fiscal year 1913 aggregated £24,500,000, including £15,000,752 interest of funded debt, £3,540,175 terminable annuities, £1,171,863 interest of unfunded debt, £166,907 management of the debt, and £4,620,303 new sinking fund. The estimated assets at the end of the year included: Suez Canal shares, estimated at £39,015,000; other estimated assets, £3,707,733; exchequer balances at the Bank of England and Bank of Ireland, £6,329,160. From March 31, 1913, to March 31, 1914, the public debt decreased from £661,473,765 to £651,270,-

091; but by March 31, 1916, as a result of the great war, it had increased to the enormous total of £2,140,000,000.

Weights, Measures, and Coinage. Two systems of weights and measures are legal not only in the United Kingdom but throughout the British Empire, viz., the Imperial and the metric. The Imperial system is constituted from a variety of ancient and of customary trade denominations and was legalized in 1824. The metric system was permitted to be used for retail trade in 1897, though it had been employed for many years prior to that by chemists, physicists, and manufacturers. Standards of weight and measure are kept at the standards department, Old Police Yard, Westminster, under the custody of the Board of Trade; with these standards other standards must be compared and verified. In practice the ancient native weights, measures, and coinage are still in common use in India. See INDIA.

Defense. Navy.—The British navy is controlled by a Board of Admiralty, which consists of six members, viz., the first lord, the first naval lord, the second naval lord, the third naval lord and controller, the fourth or junior naval lord, and the civil lord. Two other officers, not members of the board, are the parliamentary and financial secretary and the permanent secretary. The system of defense and the military and naval arrangements of the United Kingdom are peculiarly distinctive of that country. The predominating factors are its insular position and the vast extent of foreign domains that need protection. Both of them unite in making the country's safety dependent upon the strength of its navy, and accordingly this has received chief attention from the government. A rule which has been adopted is to keep the fleet as strong as the combined naval forces of any two other countries. All the principal ports are provided with fortifications, but protection against attack is left to the fleet, to mine fields, booms (carrying wire nets), wire nets supported by buoys, and the defense mobile. In time of war the latter consists of torpedo boats (including submarines) and the naval patrol. The character of the defense in all cases depends upon the local peculiarities and the general war conditions. The wire nets are intended to entangle submarines and are watched by the patrol. In the present (1916) war they have proved very efficient as a protection to the ports and to the great fleet which has its headquarters at Rosyth. Since the nets have been in position no German submarines are known to have passed through or over them and a large number have been caught in their meshes and destroyed.

The personnel of the navy consists of the active force and the reserve. (See NAVAL RESERVE.) The education of officers is fully described under NAVAL SCHOOLS OF INSTRUCTION. The enlisted force is recruited by voluntary enlistment. Preparation for the service begins between the ages of 15 and 16½ years, a term of two years being served in the training ships, at the end of which period the recruit may be drafted into the fleet to serve for a period of 12 years, when he may leave the service or reenlist for an additional period of 10 years.

On Jan. 1, 1914, the personnel was as follows: three admirals of the fleet, 12 admirals, 22 vice admirals, 56 rear admirals, 683 captains and commanders, 2414 other line officers, 503 midshipmen at sea, 848 engineer officers, 593 medical

officers, 685 pay officers, 118 naval constructors, 151 chaplains, 2693 warrant officers, 115,208 enlisted men, 471 marine officers, 21,033 marines and coast guard; total, 145,553. The naval estimates for 1913-14 increased the number to about 151,000. Successive additions since then have brought the total to 300,000. The naval budget for 1914-15 was £52,705,779. The war has greatly increased the expenditure, but the exact amount is of course unknown.

At the outbreak of the war the fleet was organized as follows:

HOME WATERS

First Fleet (except 4th Cruiser squadron)

- 1st Battle squadron: 8 dreadnoughts (1 with 10 13.5-inch guns; 7 with 10 12-inch)
- 2d Battle squadron: 8 dreadnoughts (all carried 13.5-inch guns)
- 3d Battle squadron: 8 predreadnoughts (*King Edward* type, 4 12-inch)
- 4th Battle squadron: 3 dreadnoughts, 1 predreadnought (all carried 12-inch guns)
- 1st Battle Cruiser squadron: 4 battle cruisers
- 2d Cruiser squadron: 4 armored cruisers
- 3d Cruiser squadron: 4 armored cruisers
- 1st Light Cruiser squadron: 4 light cruisers

Second Fleet

- 5th Battle squadron: 8 predreadnoughts (*Bulwark* type, 4 12-inch)
- 6th Battle squadron: 5 predreadnoughts (*Duncan* type, 4 12-inch)
- 5th cruiser squadron: armored cruisers (county class)
- 6th Cruiser squadron: armored cruisers (*Drake* class)

Third Fleet

- 7th Battle squadron: predreadnoughts (*Majestic* type, 4 12-inch)
- 8th Battle squadron: predreadnoughts
- 7th, 8th, 9th, 10th, 11th, 12th Cruiser squadrons (cruisers of all sorts)

Mediterranean Fleet

- 2d Battle Cruiser squadron: 3 battle cruisers
- 1st Cruiser squadron: 4 armored cruisers
- 2d Light Cruiser squadron: 4 light cruisers

FAR EAST

- 1 battleship
- 2 light cruisers
- 3 cruisers (armored and unarmored)
- 8 destroyers
- 3 submarines

PACIFIC

- 1 battleship
- 1 battle cruiser
- 5 light cruisers
- 6 cruisers (armored and unarmored)
- 3 destroyers
- 4 submarines

ATLANTIC

- 6 cruisers (armored and unarmored)

The principal dockyards are at Chatham, Devonport, Pembroke, Portsmouth, Rosyth, and Sheerness. Rosyth is the great naval base and repair station on the east coast of Scotland. Smaller dockyards are located at the Cape of Good Hope, Esquimaux (Vancouver Island), Gibraltar, Halifax (Nova Scotia), Haulbowline (Cove of Cork), Hongkong, Jamaica, Melbourne, Malta, and Sydney. Naval stations, some with shops, exist at Ascension Island, Bombay, Calcutta, Colombo, Dartmouth, Delagoa Bay, Deptford, Greenwich, Plymouth, Portland, Sydney, Trincomali, Weihaiwei, and London (West India Docks).

The naval schools are at Dartmouth, Osborne, Greenwich, Keyham, etc., and are fully described under NAVAL SCHOOLS OF INSTRUCTION, *Great Britain*.

The Australian navy consists of 1 battle cruiser of 18,800 tons, 2 fast cruisers of 5400 tons, 1 cruiser of 5880 tons, 1 cruiser of 2200 tons, 3 destroyers of 700 tons. Two submarines of 810 tons were lost during the war. One fast cruiser of 5400 tons and 3 destroyers of 700 tons are under construction at the dockyard on Cockatoo Island, Sydney Harbor. This dock-

yard is the principal one in the state, but there are naval bases and repair stations in Cockburn Sound and Port Western. In 1915 the personnel of the Australian navy consisted of: permanent force, 3700; naval reserve (marines), 493; naval reserve and cadets, 5024; royal naval reserve, 750; total, 9967.

The Canadian navy is of considerably less importance than the Australian, largely owing to its being nearer England. It consists of the protected cruisers *Niobe*, 11,000 tons (completed 1897), and *Rainbow* (completed 1891). They are both used as training ships—the *Niobe* on the Atlantic coast, the *Rainbow* on the Pacific. As Great Britain maintains dockyards at Halifax and Esquimaux, no others are necessary. The vessels of the revenue service, surveying department, and fisheries protection can be put in service for the defense mobile, and one mine layer and one transport were in reserve when the war broke out.

Army.—The military forces of Great Britain fall under several categories. The principal divisions are the regular army and the territorial army. The regular army in India, South Africa, and the colonies is designated as the British army, to distinguish it from the native Indian army in India (q.v.) and the local forces in South Africa (q.v.) and in the British colonies. In addition to the forces already enumerated the self-governing countries, Australia, New Zealand, and Canada (qq.v.), maintain considerable and efficient forces of militia. Large contingents for the European War were furnished by the three countries named.

The regular army in peace is divided into three classes: the permanent or standing army, called the regular army; the army reserve; and the special reserve. Service in all categories is voluntary and as follows: with the colors or regular army, from 3 to 9 years; in the army reserve, 9 to 3 years; total, 12 years, which may be extended to 21 years. Age of enlistment is between 18 and 25 years. The army reserve and special reserve furnish the men to bring the peace units to war strength.

The regular army prior to the great war was composed of 31 cavalry regiments (19 at home), 25 horse artillery batteries (13 at home), 147 field batteries (99 at home), 9 mountain batteries (all abroad), 99 companies of garrison artillery (43 at home), 77 companies of engineers (56 at home), 9 battalions of foot guards, 148 battalions of infantry (74 at home), besides administrative troops.

The special reserve was created out of the militia abolished in 1907; it is available for service abroad in war. Of the 101 infantry battalions of this reserve 74 are attached to regular regiments as depot battalions to supply vacancies in the regular regiments. The remaining 27 battalions are extra reserve battalions, which upon mobilization are filled up as separate organizations and sent into the field. In addition to the 101 battalions of infantry there are 3 cavalry regiments, 2 regiments of garrison artillery, and 2 battalions of engineers in the special reserve. Service in this reserve is for 6 years. Recruits have 5 months' preliminary training, a subsequent annual training of 3 weeks, and 6 days additional for infantry target practice.

The territorial army of Great Britain, for home defense of the British Islands, corresponds to the United States organized militia. Service

is voluntary, for 4 years; enlistments are between 17 and 35 years of age. Two weeks' annual camp and a certain number of drills and target practice are required. The officers are civilians with few exceptions. The organization corresponds to that of the regulars. The bulk of this force is organized as 14 divisions and 14 mounted brigades. A large part of this force volunteered for service abroad during the European War.

Higher Organization.—The regular troops within the British Islands are organized for war as the expeditionary force; which is composed of a cavalry division, 6 infantry divisions, army troops, and line of communication troops; total strength, 165,000. The cavalry division consists of 4 brigades of 3 regiments each, 2 horse artillery brigades (battalions), 4 engineer troops, 1 signal squadron, and 4 signal troops, 1 aeroplane squadron, 1 cavalry train, and 4 field ambulance companies; total, 486 officers, 9410 men, 10,195 horses, 24 guns.

An infantry division is composed of 3 infantry brigades of 4 battalions each, 4 field artillery brigades (battalions, 1 of which is a howitzer brigade), 1 heavy field battery, 1 ammunition column, 2 companies of engineers, 1 signal company, 1 squadron of cavalry, 1 aeroplane squadron, 1 divisional train, 3 field ambulance companies; total, 598 officers, 18,075 men, 6161 horses, 76 guns. British infantry regiments are organized only for recruiting purposes and normally are not used as tactical units. Such a regiment consists of from 2 to 4 regular battalions (half at home and half abroad) and 1 or 2 special reserve battalions. An infantry brigade commanded by a brigadier general consists of 4 battalions. The battalion of 4 companies is commanded by a lieutenant colonel, a company by a major or captain. War strength of a battalion is 29 officers and 995 enlisted men, which will give about 900 rifles on the firing line.

The British artillery (all branches) is known as the Royal Regiment of Artillery. The regiment is divided into the Royal Horse Artillery, the Royal Field Artillery, and the Royal Garrison Artillery. The British field artillery, as is the case with their artillery in general, has an unusual organization. Batteries are commanded by majors and contain 6 guns, except the heavy field-gun batteries, which have 4 guns. Horse and field batteries are grouped as brigades (battalions) of 2 and 3 batteries respectively. Heavy gun batteries are not brigaded. Brigades are grouped under a general officer to form divisional artillery. There are 76 guns with the infantry division. Cavalry divisions have 24 guns. Peace strength of batteries varies from 4 officers and 87 men to 5 officers and 179 men; war strength, horse batteries, 5 officers and 203 men; field batteries, 5 officers and 198 men; heavy field battery, 6 officers and 224 men; siege battery, 5 officers and 124 to 181 men. A coast artillery company varies from 4 to 7 officers and from 100 to 230 men. Total coast artillery, British Isles, colonies, and India, 81 companies, 14,965 officers and men.

A cavalry regiment, consisting of 3 squadrons, at war strength musters 25 officers and 537 men and is a little less than half the strength of a United States regiment. Regiments are grouped in brigades of three each. The squadron corresponds to the troop in the United States.

It counts about 150 sabres in war and is commanded by a major. Technical duties, which in the United States pertain to the engineers and to the signal corps, are performed by the Royal Engineers. The company is the unit of organization and varies in war, according to duties, from 3 officers and 106 men to 6 officers and 386 men. An army service corps provides the supply train troops. Sanitary troops and a veterinary corps are also provided.

The total peace establishment before the European War, including the regular army at home and abroad, the army reserve, the special reserve, and the territorial force, aggregated 803,037 of all ranks. The peace budget was \$144,225,000. After this original estimate for 1914-15 the army was increased to war strength at the end of 1915 by voluntary enlistment to about 3,000,000 men, exclusive of those serving in India. This figure did not include the territorial army serving at home.

Army Administration.—For the purposes of command and recruiting the United Kingdom is divided into seven territorial districts. At the head of each is a general officer with necessary assistants. The land forces are administered by an army council, composed of the Secretary of State for War, the Chief of the Imperial General Staff, the Adjutant General, the Quartermaster-General, the Master-General of the Ordnance, the Parliamentary Undersecretary of State, the Finance Member. The Inspector General of the Forces keeps this council informed of the condition of the army.

Infantry and cavalry have the Lee-Enfield rifle, calibre 0.303 inch. Light field artillery is armed with the 18-pounder, horse artillery with the 13-pounder, and heavy field artillery with the 40-pounder field howitzer and a 60-pounder gun. Aviation, especially by aeroplanes, has been greatly developed and improved by the experiences of the European War. The Royal Flying Corps (military wing) was organized Jan. 16, 1915. The number of squadrons and number of aeroplanes in each had not been made public in 1916. Before the reorganization in 1915, 8 aeroplane squadrons, each of 18 aeroplanes, had been organized.

Population. The first official census taken of Great Britain was in 1801. According to estimates made upon the basis of the Domesday record the total population of England in 1050-1100 was a little less than 2,000,000. Over half of the population was then centred in southeast England—in the counties north and south of London—the Norman Conquest having depopulated vast districts in north England. Investigators claim that it took over five centuries to double this figure. Lack of communication resulted in frequent starvation periods in numerous localities. This, together with occasional plagues, prevented a regular and normal increase. The great modern growth in population dates from the industrial evolution and the improvement in means of communication. The most remarkable feature in this development is the drift of the population from the south to the north. This was the result of improved inventions and methods which secured for manufacturing the aid of water power supplied by the streams of Lancashire and Yorkshire. Still later, when coal and iron were extensively used, these minerals also were found most abundant in this northern district. The greater moisture of the atmosphere in this re-

gion increased its desirability as a textile manufacturing centre and encouraged the growth of its population. The manufacturing and mining district around Manchester and extending southward to Birmingham is the most densely populated district of equal area in Great Britain or in the world, with the possible exception of certain districts of China. The table below shows by divisions the area (including inland water) of the United Kingdom, and the population according to the censuses of April 1, 1901, and April 3, 1911, together with the density per square mile on the latter date; figures also are shown for the Isle of Man and the Channel Islands, which, though not politically a part of the United Kingdom, are included in the British Isles.

DIVISION	Square miles	Population 1901	Population 1911	Density
England.....	50,874	30,813,043	34,045,290	669
Wales.....	7,466	1,714,800	2,025,202	271
Scotland.....	30,406	4,472,103	4,760,904	156
Great Britain....	88,746	36,999,946	40,831,396	460
Ireland.....	32,586	4,458,775	4,390,219	135
United Kingdom.	121,331	41,458,721	45,221,615	373
Isle of Man.....	227	54,752	52,016	229
Channel Islands....	75	95,618	96,899	1,292
British Isles.....	121,633	41,609,091	45,370,530	374

The foregoing population figures do not include army, navy, and merchant seamen abroad, numbering, in 1901, 224,211.

The population of England at various periods, as calculated from the numbers of baptisms, burials, and marriages, is stated as follows: in 1570, 4,160,000; in 1600, 4,812,000; in 1630, 5,601,000; in 1670, 5,774,000; in 1700, 6,045,000; in 1750, 6,517,000. The population present in the British Isles has been returned by the several censuses as shown in the table below.

	England and Wales	Scotland	Ireland	United Kingdom	Man and Channel Islands
1801	8,892,530	1,608,420
1811	10,164,256	1,805,864
1821	12,000,230	2,091,521	6,801,827	20,893,584
1831	13,896,797	2,364,386	7,767,401	24,028,584
1841	15,914,148	2,620,184	8,175,124	26,709,456
1851	17,927,609	2,888,742	6,552,385	27,368,736	143,126
1861	20,066,224	3,062,204	5,798,967	28,927,485	143,447
1871	22,712,266	3,360,018	5,412,377	31,484,661	144,638
1881	25,974,439	3,735,573	5,174,836	34,884,848	141,260
1891	29,002,525	4,025,647	4,704,750	37,732,922	147,842
1901	32,527,843	4,072,103	4,458,775	41,458,721	150,370
1911	36,070,492	4,760,904	4,390,219	45,221,615	148,915

Of the total population of the British Isles in 1911, 22,016,661 were males and 23,353,869 females; in England the number of males was 16,421,298 and of females 17,623,992; in Wales, 1,024,310 and 1,000,892; in Scotland, 2,308,839 and 2,452,065; in Ireland, 2,192,048 and 2,198,171; in the Isle of Man, 23,937 and 28,079; in the Channel Islands, 46,229 and 50,670. The increasing importance of manufacturing and mining as against agriculture has given England a larger percentage of urban population than any other country.

In England and Wales the population of urban districts in 1901 was 25,058,355 and of rural

districts 7,469,488; in 1911, 28,162,936 and 7,907,556. In Scotland the urban population (which in that country includes localities with over 1000 inhabitants) numbered 3,591,276. In Ireland the civic population in 1911 numbered 1,470,595. For many years the rural increase of population in Great Britain has been insignificant as compared with the urban.

The gain in the population of the United Kingdom has been made notwithstanding the great emigration to its colonial possessions or to other countries. The largest was in 1880-93, when the English emigration averaged over 150,000 annually. The United States received about two-thirds of the whole number. The number of outward-bound passengers of British nationality from the United Kingdom to countries out of Europe was 8,864,756 in the period 1853-1900; in 1901-05, 1,170,839; in 1906-10, 1,670,625; in 1911, 454,527; in 1912, 467,066, in addition to which outward-bound alien passengers to non-European countries numbered 189,169, the total outward bound in 1912 being 656,835. Inward-bound passengers in 1912 from non-European countries numbered 340,096 (199,181 British and 141,515 alien), the balance outward for the year being 316,130. The Aliens Act of 1905 aims to keep out undesirable immigrants without infringing on the traditional right of asylum to religious and political refugees. The birth and death rates are decreasing; the marriage rate remains more nearly stationary. The following table shows the rate per thousand of population, of births, deaths, and marriages (i.e., persons married).

	England and Wales	Scotland	Ireland	United Kingdom
Births				
1900.....	28.7	20.6	22.7	28.2
1910.....	25.1	26.2	23.3	25.0
1913.....	23.9	25.5	22.9	23.9
Deaths				
1900.....	18.2	18.5	19.6	18.4
1910.....	13.5	15.3	17.1	14.0
1913.....	13.7	15.5	17.1	14.2
Marriages				
1900.....	16.0	14.6	9.5	15.1
1910.....	15.0	13.0	10.1	14.3
1913.....	15.5	14.3	10.2	14.9

In Wales and Monmouthshire persons of three years of age and upward speaking Welsh only constituted in 1901 about 13.9 per cent of the population and in 1911, 7.9 per cent; speaking Welsh and English, 32.2 in 1901 and 32.5 in 1911; thus about 40.6 per cent could speak Welsh in 1911, as compared with 46.1 in 1901 and about 70 in 1881;—in Scotland, speaking Gaelic only, 0.6 per cent in 1901 and 0.4 per cent in 1911; speaking Gaelic and English, 4.5 and 3.9;—in Ireland, speaking Irish only, 0.4 per cent in 1911; speaking Irish and English, 12.9. For further details of population, see ENGLAND; SCOTLAND; IRELAND.

Religion. In England and Wales, in Scotland, and in Ireland, different churches are dominant; in the first the Protestant Episcopal, in the second the Presbyterian, and in the third the Roman Catholic. In the first two the respective churches are the Established state churches. The Protestant Episcopal church was also the Established church of Ireland during 1801-61. The religious reformation of the sixteenth century was received differently and followed different courses in each of the three

political divisions. In England and Wales the Church maintained its organization unbroken, simply severing its connection with Rome. The movement in Scotland was more radical, necessitating a new organization. In Ireland the native Irish element remained loyal to Rome, only the limited English population revolting. But while the respective churches which the Reformation left in power in the three kingdoms are still the predominant organizations, their majorities have been reduced, and the present religious status differs much from that of the earlier time.

The changes have been most marked in England and Wales. From the first there were dissenters (Nonconformists) from the state church; and the Presbyterians, Congregationalists (or Independents), and Baptists date from this early period. Just prior to the rise of Cromwell the Nonconformists had apparently secured considerable power; but the attempt to make the Presbyterian church the Established church (1648) failed. The Puritan element was dominant during Cromwell's rule. In the following reaction the ranks of the Nonconformists were much reduced, and it was not until the Methodist revival that they again became prominent. In 1700 it was estimated that the Nonconformists numbered less than one-twentieth of the English population. In the eighteenth century religious indifference settled upon the country, from which it was aroused by the preaching of Wesley and his Methodist following. Wesley himself remained a member of the state church and desired that his followers should not be separated from it; but divergence from the Established church was carried too far, and after his death the Methodists became organized (1795) as a separate body. The spirit of the movement was taken up in a degree by other bodies, and the older Nonconformist churches, particularly the Congregationalists, enjoyed a considerable growth in membership. Later there were a number of divisions within the Methodist church, but the Wesleyan Methodists, with a little over half of the entire Methodist following, are stronger than any other Nonconformist church. In the absence of any religious census the strength of the different elements is estimated upon some such basis as the percentage of marriages celebrated according to the rites of the different bodies.

In 1911, in England and Wales, the Episcopal rites were used in 61 per cent of the marriages, the Roman Catholic rites in 4.4 per cent, while the ceremonies in the registered places of other Christian denominations numbered nearly 14 per cent, and the civil marriages 20.9 per cent. It is estimated that the number of people not in the Established, Roman Catholic, or Jewish churches, who are therefore presumably Nonconformists in sympathy, is considerably over one-fifth of the total population. After the Methodists, the Congregationalists and the Baptists are strongest, the Presbyterians following with a much smaller number, the members of this church being most numerous in the northern counties of England. The Nonconformists strongly predominate in the northern counties of Wales, and attempts have been made to secure the disestablishment of the Episcopal church in Wales. The Roman Catholic church had remained small in England and Wales until the influx of the Irish in the famine years from 1845 on. More recently the Roman Catholics have

secured many converts from the Established church. Their number is estimated at about 1,800,000. The Church of England, on account of its latitudinarian policy, retains widely diverse factions within its organization. Since about 1850 the High Church element, inclined towards a greater ceremonial, has become preponderant, while the Broad Church movement, which stands especially for a more liberal theology, has also grown at the expense of the old Low Church.

Presbyterianism is much stronger in Scotland than Episcopacy is in England. But the Episcopal and the dissenting churches in Scotland show a comparatively small increase. Latterly the Roman Catholics have grown in Scotland, and their number is estimated at about 550,000. However, Presbyterianism itself has undergone a number of schisms. The Established branch, though numbering over half of Scottish Presbyterians, contains less than half of Scottish Church communicants. When, after the union with England, Parliament gave lay patrons the right to present clergymen to vacant benefices, the ensuing dispute resulted, early in the eighteenth century, in two divisions, the seceding bodies afterward forming the United Presbyterian Church of Scotland; and finally in 1843 the same question caused another division from the Established church, which gave rise to the Free Church of Scotland. In 1900 this body joined the United Presbyterian branch under the name of the United Free Church of Scotland. Of the minor Presbyterian divisions the most important is the Reformed Presbyterian. Neither the Established church in England nor the Established Presbyterian church in Scotland receives any state financial aid. The support of the Episcopal church is secured mainly from the local endowments of the individual churches.

In Ireland the Celtic element has persistently stood by the Roman Catholic faith, but the early influx of Scottish Presbyterians and English Episcopalians and the very heavy emigration of the Roman Catholics in the nineteenth century have resulted in appreciably reducing the Roman Catholic percentage. The Episcopalians, who in 1911 numbered about 577,000, are mainly in the eastern portion of the island. The Presbyterians, numbering about 441,000, are confined largely to the northeastern part. There are about 62,000 Methodists.

Jews are not numerous in the United Kingdom, 245,000 being given as their number in 1915. They are confined to London and a few of the other large towns. The organization of the different denominations represented in the United Kingdom will be given under the respective titles of those bodies. See also IRELAND.

Education. The educational systems in England and Wales and in Scotland respectively have developed along widely divergent lines. The former had no public-school system until late in the nineteenth century, and its development then was hampered by religious controversy. Scotland provided for public schools before the close of the seventeenth century, and the system was free from religious interference. In earlier times a large number of endowments had been established in England, usually by some religious sect; but the instruction went little beyond the dead languages and was given to comparatively few. The administration of endowments was defective, and many endowments were lost or diverted into other channels.

Early in the nineteenth century an interest in general education was aroused mainly by two rival organizations: the British and Foreign School Society, dating from 1808, representing the dissenting religious elements; and the National Society (1811), representing the Established church. In 1816 and 1818, respectively, elementary education and educational charities were investigated by the government, but no money was granted them until 1833, when \$100,000 was divided between the educational societies. Government inspection, subject to approval of each inspector by one of the rival factions, was the condition of receiving the grant. In 1856 an educational department was founded to administer the grant. The funds were distributed according to results of the examinations held by the inspector in reading, writing, and arithmetic. In 1869 the school accommodations were only half those required, though they had doubled during 1859-69. In 1870 the Elementary Education Act established the basis of the general educational system still in force. It applied to all children between 5 and 14. Other leading features were annual parliamentary grants to public and private schools on the same terms; a central administrative agency; wherever necessary, school boards to be elected and board or public schools to be established; in board schools no religious catechism to be taught, though religious instruction might or might not be given; in the voluntary schools religious instruction not to be forced upon a child if its parents objected. In 1872 a similar system was established for Scotland, but with elected school boards for every parish, and these in charge of both higher and elementary education. Scotland has its own central administrative board. In 1900 improved secondary and technical instruction in England was secured by uniting under a board of education the former separate department of education and science.

The Education Act of 1902, reactionary at some points, was at other points a great advance in the conditions prevailing since 1870. It caused acute political differences; it contributed to the overthrow of the Conservatives in 1905 and led to the introduction of the Birrell Education Bill of 1906, which caused great popular disapproval by its provision for support of the voluntary or religious schools by local taxes, while leaving their control with religious bodies. The Birrell Bill was withdrawn because the House of Commons refused to accept amendments made by the House of Lords. The voluntary or Church schools are mainly in rural regions or small towns and are most controlled by the Established church. In 1912 the number of voluntary schools in England and Wales was 12,704, with accommodations for 2,797,636 pupils, while the number of council schools was 8196, with accommodations for 4,065,240 pupils. Of the voluntary schools, 10,877 schools (2,227,431 pupils) were controlled by the Church of England, 1082 schools (377,859 pupils) were Roman Catholic, 214 schools (65,749 pupils) were Wesleyan, and the remainder were divided among various denominations, including the Jewish, or were undenominational. The chief benefit of the Act of 1902 was the substitution of an educational unit of administration (the county council) for the numerous bodies that enforced the Law of 1870. Thus two great features hitherto absent from the English system were obtained: first, a public authority charged with educational interests;

second, these councils have the power of coördinating every branch of education, elementary, secondary, and technical. They are empowered to levy taxes, may borrow money, and can turn over the control of each local school to a board of six managers, one of whom is appointed by the religious body furnishing the school building and equipment.

Education is now compulsory in both England and Scotland for the age period from 5 to 14, though total or partial exemption may be secured at the age of 11 in England and of 12 in Scotland. Kindergarten work is given a prominent place in the elementary system. Women may be elected members of the school boards. In England and Wales, on July 31, 1912, departments in the ordinary public elementary schools numbered 32,234; accommodations, 6,862,876; teachers, 41,307 men, 122,676 women; pupils enrolled, 3,044,384 boys, 2,992,986 girls; average attendance, 88.79 per cent. There were 51 higher elementary schools, with 464 teachers and 10,806 pupils (average during the year). In Scotland, for the year ended Aug. 31, 1912, there were 3164 public primary schools in receipt of grants, with accommodations for 1,042,703 pupils, 820,171 pupils enrolled, and 733,792 in average attendance; 196 higher grade schools in receipt of grants, with 24,544 pupils enrolled and 24,201 in average attendance; 1152 continuation classes, with 144,815 pupils. Teachers, including those in the higher-grade schools; numbered 5362 men and 15,096 women. In Ireland, on Dec. 31, 1912, public primary schools in operation numbered 8255, with 13,213 teachers, accommodations for 769,697 pupils, an enrollment of 668,974, and an average attendance of 499,038. The public schools for which statistics are here given must not be confounded with the many private English institutions known as the public schools.

Secondary and Technical Education.—The secondary public school is not thoroughly established. In England and Wales, on Jan. 31, 1912, there were 995 secondary schools recognized for grant, having full-time teachers 5106 men and 4974 women; part-time teachers 3326, and full-time pupils 89,004 boys and 76,613 girls. At evening and similar schools pupils enrolled in 1912 numbered 784,984; in day technical classes, 11,758; in technical institution courses, 1289; in art classes, 3250; in schools of art, 41,677 (20,359 males, 21,318 females). In Scotland, for the year ended Aug. 31, 1912, there were 56 secondary schools claiming grant, with 1175 teachers, 20,484 pupils enrolled (11,956 boys, 8528 girls), and 19,458 in average attendance. There is a large number of secondary schools maintained by private enterprise, endowment, subscription, etc. These schools emphasize distinctions based upon social caste, and some of them are very exclusive. In Wales each county has an educational council, and over all is a central board with powers of inspection and examination of the secondary schools. In Scotland school boards may establish secondary schools.

The Scottish provision for evening continuation schools is almost identical with that of England. In England and Wales there is no thoroughly defined system of technical instruction, although, through the assistance of special grants, manual training and the industrial arts and sciences are given much attention, while the municipalities have been active in building technical institutions. In Scotland technical schools may be established by school boards.

Universities.—Great Britain does not provide so amply for university education as do some other large European countries. Within the last few decades, however, the number, attendance, and influence of universities have increased. The new colleges are free from the traditional restrictions of Oxford and Cambridge, and their courses have better met the demands of science and local industries. London University, constituted an examining body in 1836, became also a teaching body in 1900, comprehending in 1913-14 over 30 colleges, with an enrollment of 5840. In 1878 colleges situated at Manchester, Leeds, and Liverpool were federated under the title of Victoria University. The Durham University, established in 1832, was extended in 1871 so as to include the colleges of medicine and science at Newcastle-upon-Tyne. Birmingham University was constituted in 1900. All of these, established first by private beneficence, now receive government aid. Birmingham rejected the widely adopted plan of affiliated collegiate institutions and was the first autonomous, compact, self-centred institution, similar to those of the United States and continental Europe. This institution was equipped for teaching, research, and examination from the first and was imitated in other large industrial cities. In 1903 the University of Liverpool was founded on the basis of the old college, which had been a constituent part of Victoria University. In the next two years Manchester, Leeds, and Sheffield followed this example and established independent universities. See articles on the universities of OXFORD, CAMBRIDGE, LONDON, WALES, ST. ANDREWS, GLASGOW, ABERDEEN, and EDINBURGH.

Charities. Charitable functions, at first exercised by the Church as a religious duty, were gradually taken over by the parishes, and when the towns and guilds became powerful they established charitable institutions for the benefit of their members. It was not until the Reformation, however, that the state began to deal with the problem of pauperism. The relief supplied formerly by the monasteries had to be replaced, so that during the reigns of Henry VIII and Elizabeth a general state policy was rapidly developed. By an Act of 1601 a regularly assessed poor rate became compulsory, laying the foundation principles of the poor-law policy. Children were provided for through apprenticeship, and adults able to work were compelled to do so, while to others relief was given. A law passed in 1723 made possible the establishing of workhouses and the application of the principle that those might be used as a test of need, and outside relief refused to the able-bodied. Many persons failed to adapt themselves to the changed conditions brought on by the industrial revolution in the beginning of the eighteenth century, and the pauper element rapidly increased.

The Gilbert Act of 1782, while creating the Poor-Law Union and introducing other administrative improvements, violated the workhouse test by making outdoor money aid possible. In 1795 this was further violated by supplementing the ordinary wage of the laborer with money aid, the amount of which was increased by the number of members in the family. These aids tended to weaken the sense of personal responsibility, a large portion of the agricultural laborers became pauperized, relief was expected, and disgrace no longer attached to it. In 1802-03, 28 per cent of the population in England and Wales re-

ceived permanent or occasional aid. Conditions became very bad, and in 1834, as the result of the investigations of a parliamentary commission, measures were passed which marked a new epoch in poor-law administration.

A commission was established which became a permanent government department in 1867 and in 1871 was known as the Local Government Board. The board consists of a president appointed by the King and a number of ex-officio members. It not only enforces law but also issues orders and regulations. It establishes unions and determines district boundaries and exercises administrative and financial control over guardians. Assistant commissioners were appointed as agents, and later these were succeeded by inspectors. Auditors examine accounts and disallow improper expenditures, while guardians have absorbed most of the former functions of overseers and are the chief local officers of poor relief.

The unit of administration of the board of guardians is the poor-law union, a combination of parishes. Each parish selects one or more guardians, and these may choose two additional members. In the rural districts the poor law is administered by the district councilors. The most important of the appointed officers are the relieving officer, who investigates and deals immediately with the case at hand, the clerk, who is the secretary of the board, and the assistant overseers and collectors. While the poor rate is levied upon the parish, the cost of relief is defrayed from the common fund of the union. Provision is made for the combination of unions into larger districts for special purposes, as in the case of the maintenance of pauper institutions.

Since 1830 the policy pursued has been to limit relief as much as practicable to indoor methods. Asylums, infirmaries, and hospitals are provided for the classes needing such treatment as these institutions afford; schools and training ships for children; and workhouses for the able-bodied. In the care of children considerable progress has been made in the operation of the placing-out system.

The experience of Scotland has been much different from that of England, particularly in its lack of continuity. The Scottish Parliament passed laws for poor relief as far back as 1575, but compulsory taxes were not generally collected until the nineteenth century. An Act was passed in 1845 providing a system of poor relief, resembling that of England and Wales, which is still operative.

The mean number of paupers and the ratio per thousand of estimated population relieved on January 1 and on July 1 preceding (exclusive of casual paupers and insane) are reported as follows for England and Wales:

YEAR	INDOOR		OUTDOOR		TOTAL*	
	No.	Ratio	No.	Ratio	No.	Ratio
1900...	188,423	5.9	500,214	15.8	688,505	21.7
1905...	222,217	6.6	542,891	16.1	764,589	22.7
1910...	256,523	7.2	534,933	15.1	790,496	22.3
1914...	234,510	6.4	382,734	10.4	617,128	16.7

* Deductions are made from total for paupers who received both indoor and outdoor relief on the same day.

A number of paupers, especially outdoor paupers, ceased to be dependent on poor relief

in 1911 in consequence of the partial removal of the pauper disqualification for old-age pensions.

In parishes in Scotland the poor of all classes (including lunatic poor) in receipt of relief on Jan. 15, 1914, were 66,832 paupers and 38,413 dependents. In unions in Ireland the number of paupers in receipt of relief at the close of the first week of January, 1914, was 74,841 (of whom 3915 were able-bodied adults receiving indoor relief). Throughout Great Britain private charity is very active and is thoroughly organized. There is a very clear distinction between state and private charities, and the two cooperate harmoniously. The state aims only to alleviate actual distress, regardless of its cause or the character of the individual, and it does not undertake to prevent poverty. Private charities cover a much wider scope, attending to many questions of public welfare, aiming to prevent and improve conditions that are not necessarily due to immediate distress.

Colonies. While directly after the repeal of the Corn Laws of 1846 many persons, both in the mother country and in the colonies, considered a complete separation of the colonies and Great Britain desirable and probable, since about 1870 the tendency has been towards a closer union of the various members of the British Empire. The mutual interest existing between the colonies rests not only upon a feeling of racial and cultural kinship, but upon such practical matters as trade and defense. The first important step taken to strengthen this bond was in the conference held at London in 1884 by the Imperial Federation League. Numerous conferences have been held since, and were given mainly to the discussion of closer Imperial co-operation and unity. For a statement of the varying methods of government and the area and population of the colonies, see **BRITISH EMPIRE** and the articles on the different colonies.

Government. The constitution of the United Kingdom is the result of long historical growth. It is more largely unwritten than that of any other country of western Europe. What is written is not in a single instrument, but is scattered through various acts of Parliament and solemn agreements from the Middle Ages to the present. The unwritten part consists of customs, maxims, and institutions which, in virtue of long acquiescence of the nation, have acquired the force of written law. The British constitution is not, therefore, the artificial creation of a single constituent body organized to incorporate in legal institutions the results of a violent and bloody revolution. See **PARLIAMENT**.

The House of Commons at present (1916) consists of 670 members, of whom England chooses 465, Wales 30, Scotland 72, and Ireland 103, and they are elected by secret ballot for a term of five years. The voter in an English county or borough must be a male citizen 21 years of age, a freeholder of the annual value of 40s., or a copyholder or leaseholder of the annual value of £5. But if he has no such interest in real estate he must be a householder of the annual value of £10 or a lodger of the same value. In Scottish and Irish counties the qualifications are substantially the same. The more important disqualifications relate to the holding of incompatible offices at the same time, conviction of certain crimes, and receipt of poor relief. Voters with sufficient property in different districts may vote in each district. Members are distributed

according to population and are chosen by districts and on single ticket. Members of the House of Commons must be male citizens not under 21 years of age. Disqualified are English and Scottish peers, representative Irish peers, Roman Catholic priests, clergymen of the Established church, judges, sheriffs, and other returning officers, government contractors, bankrupts, and persons convicted of certain crimes.

The House of Lords consists of (1) English hereditary peers whose ancestors have received a royal summons to Parliament since 1295, or who have themselves received a patent of nobility in the United Kingdom; (2) 16 Scottish representative peers chosen for the term of Parliament by a majority of all the Scottish peers, i.e., those whose ancestors sat in the Scottish House of Lords before the union; (3) 28 Irish peers chosen for life by all the Irish peers; (4) 2 archbishops and 24 bishops by virtue of their office; and (5) 4 judicial members, known as Lords of Appeals in Ordinary, appointed by the crown for life. The full House (in 1915) would consist of 654 members. The crown may create an unlimited number of English hereditary peers, but this is not true of life peers and of Scottish and Irish peers. The only qualification for membership in the House of Lords is male sex, citizenship, and attainment of the age of 21 years, while bankruptcy and conviction of felonious crime disqualify.

The members of both Houses are privileged from arrest except for indictable offenses—the Commons during the session, and 40 days before and after, the Lords at all times. They cannot be questioned outside of Parliament for opinions expressed or votes cast in that body; but the courts have held (*Stockdale and Hansard*) that if the Commons have their speeches published and circulated they are amenable to the law of libel and slander as private individuals are. Up to 1911 members of neither House received pay for their services, except that an occasional constituency undertook to pay its member a salary. In August of that year a resolution of the House of Commons provided for an annual salary of £400 to members other than those already in receipt of salaries.

Parliament must assemble at least once in three years. It usually meets annually, in February, and remains in session until midsummer. It is summoned, opened, and prorogued by the crown and upon the advice of the Prime Minister. It is dissolved either by legal expiry of the term of the Commons or by order of the crown, with the advice of the ministry. Parliament has seldom lasted through its full term, dissolution usually resulting from the action of the crown. Dissolution ends the House of Commons without affecting the Lords, except the Scottish peers elected for the term of Parliament, while prorogation ends the session merely. Formerly the sovereign's death dissolved Parliament, but a recent law abolished this custom. Either House may adjourn for short periods of time independently of the other or of the crown. The internal organization of Parliament is left partly to the action of each House. Thus the Commons choose their own Speaker, although by custom the presiding officer in the House of Lords is the Lord Chancellor, a member of the ministry. But as he may be a member of the House of Commons, his seat is placed without the limits of the chamber in which the Lords hold their sessions. The other officers of Parliament are

appointed by the crown. Over its discipline and procedure each House has full control, and may expel a member or punish an outsider for contempt. A quorum necessary for doing business is fixed at 40 in the British Commons and three in the Lords. The constitution places no legal limitations upon the power of the British Parliament. Its power, however, is a present one and cannot bind future parliaments. See LORDS, HOUSE OF; PARLIAMENT.

The executive power is, nominally at least, in the crown, which is legally and theoretically irresponsible, immaculate, and immortal. It is hereditary, according to lineal primogenial descent, with preference for males over females among brothers and sisters. The ruler must not be a Roman Catholic, must be a communicant of the Established church, and apparently by custom must be 18 years old before exercising the royal powers. At present the powers of the crown include the declaration of war; the negotiation of treaties; the appointment and reception of diplomatic officers; the issuance of passports; the command of the army and navy, with a large power over the appointment, promotion, and dismissal of officers, and the promulgation of rules for the government and disposition of the forces; the appointment of all the civil officers of the government and the removal of most of them; the appointment of the high clerical officers of the Established church, and full power of control over the ecclesiastical parliament or convocation; and the granting of pardons. The power of the crown in legislation has already been discussed in connection with the subject of Parliament. The power of the crown to veto all legislative measures passed by the Houses of Parliament has not been exercised since 1707 and has practically fallen into disuse.

As already stated, the crown is irresponsible. It therefore exercises its powers through a responsible ministry selected from the members of Parliament belonging to the political party which has a majority in the House of Commons. They are also the heads of the executive departments and members of the King's Privy Council. The King appoints the Premier, who is the leader of the party in power and who selects the other members of the cabinet from his own party. They may be members of either House, but commoners must resign their seats and be reelected. The cabinet is an extra-legal institution, having never been recognized by act of Parliament; the names of the members are never officially announced to the public, and no record is kept of its meetings or acts. The size of the cabinet varies according to the prominence which certain interests are likely to assume in the Parliament. Strictly speaking, it need not, according to custom, include more than 11 members, viz., the First Lord of the Treasury, the Lord Chancellor of England, the Lord President of the Council, the Lord Privy Seal, the Chancellor of the Exchequer, the Secretaries of State for Home Affairs, for Foreign Affairs, for the Colonies, for India, and for War, and the First Lord of the Admiralty. To these may be added the President of the Local Government Board, the President of the Board of Trade, the Chief Secretary to the Lord Lieutenant of Ireland, the Lord Chancellor of Ireland, the Secretary for Scotland, the First Commissioner of Works, the President of the Board of Agriculture, the President of the Board of Education, the Chancellor of the Duchy of Lancaster, the Postmaster-General, and

the Attorney-General. A minister of munitions and a minister of war trade were added to the cabinet after the outbreak of the great war. The legislative duties of the cabinet are to urge the adoption of government measures in the House of Commons and to defend the government's policy against the opposition, and for that purpose the members have seats in Parliament. It initiates public legislative measures and leads the majority in debate. The ministers are responsible to the Commons for their policy, and if defeated on any important measures, or if the House votes lack of confidence in them, they resign, and another ministry is formed from the new majority. If, however, the defeated cabinet think they still represent the popular will, they can ask the King to dissolve the House of Commons and order a new election. If the electorate pronounces against them, they must resign. Their responsibility is collective, and therefore they all go out together unless the conduct of a particular minister has been such that the responsibility for the objectionable policy may be fixed on him, in which event he alone resigns. This happened in 1851 in the case of Lord Palmerston, the Foreign Secretary, who was forced to resign.

In addition to their legislative functions the ministers act as heads of the various departments of administration. The Prime Minister usually takes the portfolio of the Treasury Department with the title of First Lord of the Treasury. There are few duties, however, attached to the First Lordship of the Treasury, the actual head being the Chancellor of the Exchequer, the chief financial officer of the government. He prepares annually and submits to Parliament the budget or statement of the estimated receipts and expenditures of the government for the ensuing year, together with suggestions for the increase or reduction of taxation in case of expected deficit or surplus. The duties of the Foreign, Colonial, War, and India secretaries are sufficiently clear from the names. The Secretary for Home Affairs supervises the police and certain local administration, advises the sovereign in the matter of granting pardons, and in part concerning labor legislation. The Admiralty administers naval affairs and is controlled by six lords. The Board of Trade supervises commercial, railway, marine, and statistical affairs, coinage, weights and measures, and the post office.

The judicial system has only two tribunals which are in any sense constitutional courts: the House of Lords and the Judicial Committee of the Privy Council. The House of Lords acts as a criminal court for the trial of peers, as a general court of impeachment, and as the highest court of appeal for the United Kingdom. In the last-mentioned capacity only the Lord Chancellor, who presides, the Lords of Appeal in Ordinary (four life lords of high judicial standing provided for by statute), and such members as have formerly held high judicial office, take part in the hearing. The jurisdiction of this court includes cases appealed from any appellate court in England, or from any court in Scotland or Ireland, from which appeals were allowed to the House of Lords previous to 1876. The Judicial Committee of the Privy Council is a court of last resort for India, the colonies, the Isle of Man, the Channel Islands, and the vice-admiralty courts abroad. Its personnel is substantially the same as that of the House of Lords when sitting

as highest court of appeal. Apart from these tribunals the general courts of the Kingdom are the High Court of Justice and the Court of Appeal. The former consists of three sections, known as the Chancery Division, of six judges, the King's Bench Division, of 15 judges, and the Probate, Divorce, and Admiralty Division, of two judges. Appeals lie from this court to the Court of Appeal, a tribunal consisting of the Master of the Rolls, five justices, and the three presidents of the divisions of the High Court. The principal criminal courts are the petty sessions and quarter sessions, held by the justices of the peace; the assize courts, held four times a year in certain towns, usually by judges of the King's Bench Division; and the Central Criminal Court, which is the court of oyer and terminer and jail delivery for the city of London and surrounding territory.

The English system of local government is highly complex and difficult of explanation. The parliamentary Acts of 1888 and 1894 somewhat simplified the system. The more important local units are now counties, county boroughs, municipal boroughs, urban districts, rural districts, parishes, and school districts. The chief county officers are the Lord Lieutenant, the sheriff, the justices of the peace, the clerk, and the coroner. The Lord Lieutenant represents the crown in the county and is the keeper of the records. The sheriff, who formerly wielded large powers, is now a ministerial officer whose chief duties relate to the enforcement of the judgments of the courts and the holding of parliamentary elections. The justices of the peace were in 1888 stripped of most of their former administrative and financial powers by the Local Government Act of that year and are now chiefly judicial functionaries who attend to the preliminary investigation of all crimes. The Lord Chancellor appoints them upon nomination by the Lord Lieutenant of the county in which they reside. They try minor offenses without a jury. As a criminal court of first instance they all sit together in a court of quarter sessions, and without a jury they are a court of appeal from orders and decisions of justices acting individually or in petty or special sessions. They still retain some administrative duties, such as issuing liquor licenses, appointing overseers of the poor, and assisting in police administration.

By the Act of 1888 there was created in each of the 62 administrative counties (except the administrative county of London) into which England and Wales are divided a popularly elected County Council of councilors and aldermen, the latter selected by the councilors, usually from their own body. Councilors sit for three years, the aldermen for six, one-half their number retiring every third year. They all sit together under the presidency of a county chairman, chosen from the aldermen; he alone receives compensation. The powers and duties of the County Council include (1) care and administration of county property; (2) selection and supervision of most of the minor county officers; (3) assessment of rates and raising of loans; (4) management of highways; (5) granting of licenses to music and dancing houses; (6) control of the police (except in London) through a committee of the Council; and (7) a variety of other local matters. Like the similar county authority in the United States, the English County Council is restricted to enumerated powers.

Below the county is the district, either rural or urban. The Act of 1894 provided that each rural district should consist of a group of rural parishes, and its chief organ a council elected for three years by the parish assembly, and vested with administration of the poor law, the public health, and the highway acts. The urban district consists of a group of urban parishes in unincorporated boroughs, and, like the rural district, has a council with the same powers, except that the poor-law administration is left to a board of guardians. Below the district is the parish, urban or rural. In 1894 the rural parishes were reorganized, but the urban were only slightly changed. By that act every rural parish of not more than 300 people has a parish meeting, or assembly, at which every elector has the right to vote. Rural parishes of more than 300 people have also a parish council of from 5 to 15, elected for one year. The councils have taken over the civil powers of the old vestries, which after 1894 were ecclesiastical bodies merely, and besides have duties relating to charities, water supply, public health, highways, and other matters.

Incorporated towns, including county boroughs (i.e., boroughs which are treated somewhat as a county), are governed by a mayor, aldermen, and councilors, which together constitute a municipal corporation, known as the council. The councilors are elected practically by the ratpayers for three years, one-third retiring annually; the aldermen, by the council for six years, one-half retiring every third year; and the mayor by the council for one year. He alone is salaried, and is an ex-officio justice of the peace. The municipal corporation has only enumerated powers, substantially the same as the urban council, but provision is made for a separate quarter session and a separate police force.

London, by the Local Government Act of 1888, was made an administrative county with its own council, sheriff, and other officers. In 1901 the County of London, aside from the city, was divided into 28 metropolitan boroughs, each with its mayor, aldermen, and councilors, which take the place of the old parish vestries, formerly the chief local governing bodies of the metropolis.

The recent parliamentary legislation has shown a marked tendency towards greater central control over the local administration. The chief organ of supervision is the Local Government Board, created in 1871, the president of which is usually a cabinet minister. It can approve or disapprove many acts of the local organs, can audit the accounts of the local authorities, compel them to act in certain particulars, and to a certain extent can discipline local civil servants.

Scotland.—The government of Scotland, since the union with England in 1707, has been part of the general administration of Great Britain. The connection was maintained chiefly through the Home Office until 1885, when the office of Chief Secretary for Scotland was created, and duties previously discharged by different departments were transferred to the new office. The Chief Secretary is usually a cabinet minister, and the chief cabinet spokesman in the House of Commons in regard to Scottish business. The Lord Advocate, the chief law officer of the crown for Scotland, is the legal adviser of the crown in Scottish affairs. He serves as Attorney-General for Scotland, controls the whole criminal business of that country, also the preparation

for Parliament of all Scottish bills, and is assisted by a Solicitor-General for Scotland, whose duties resemble those of the similar officer for England. Local government in Scotland is regulated chiefly by Acts passed in 1889 and 1894. By the former elective county councils were created similar to those provided for English counties in 1888. They took over most of the duties of the old county boards, the chief of which was the Commission of Supply. The Act of 1894, like the Act passed the same year in England, provided for an elective parish council in each parish to take the place of the old parochial boards and to exercise substantially the same powers as the English parish councils. The same Act created a local government board for Scotland, consisting of the Secretary for Scotland as President, the Solicitor-General, the Undersecretary for Scotland, and three other members appointed by the crown. Scottish municipal administration differs little from that of England. Some burghs have a little more local autonomy than others. The municipal officer corresponding to the English alderman is known in Scotland as the baillie, while the Scottish provost corresponds to the English mayor.

The Scottish Court of Sessions corresponds to the Supreme Court of Judicature in England. It is the highest Scottish civil tribunal, consists of 13 judges, and is divided into chambers and subdivided into divisions for the dispatch of business. The Supreme Criminal Court for Scotland is the High Court of Justiciary, consisting of all the judges of the Court of Sessions. It sits part of the time in Edinburgh and part of the time goes on circuit. Circuits are held twice a year, for which purpose Scotland is divided into three districts. For the trial of criminal cases, usually one judge with a jury of 15 men constitutes the court. The High Court has exclusive jurisdiction in cases of treason, murder, robbery, rape, and the other more serious offenses. The more important inferior courts of Scotland are held by county sheriffs, appointees of the crown, for a good behavior tenure. They have civil and criminal jurisdiction somewhat similar to that of the county courts and courts of quarter sessions in England, and cases tried by them with a jury cannot be appealed. For the government of Ireland, see IRELAND.

HISTORY

Development of Cabinet Government, 1688-1760. The legislative union of England and Scotland was formally consummated on May 1, 1707. There had been much opposition to the union in Scotland on account of the unwillingness of the English Parliament to grant a trade-union with equality of commercial privileges; but the threatening measures of the Scottish Parliament looking towards an absolute separation overcame this unwillingness, and Scotland was received as an equal in all respects, with a proportional representation in both Houses of the new British Parliament. Ireland was less fortunate. The Protestant Parliament there, in direct violation of the Treaty of Limerick, made the position of the Catholic population, which was the great majority, almost intolerable. The English Parliament, by forbidding the import of Irish meat and cattle into England, and the export of Irish woolen goods to any country other than England in 1699, effectually destroyed Irish trade. During the latter part of the reign of Anne the Tories, under the leadership of Harley

(Earl of Oxford) and St. John (Earl of Bolingbroke), ruled the country. The Tories did all they could to preclude their opponents from the possibility of future success. The Occasional Conformity Act and the Schism Act further disqualified Dissenters from voting or holding office. The creation of 12 new peers in 1711 gave the Tories a majority in the Lords and was a most important constitutional measure, since it demonstrated that in case of disagreement between the two Houses the Commons could always prevail by the creation of the requisite number of peers to constitute a majority. Harley and St. John even contemplated the restoration of the house of Stuart in order to prevent the Whigs from returning to power; but their plans were thwarted by the refusal of James the Pretender to declare himself a Protestant and by the sudden death of the Queen in 1714. The Treaty of Utrecht, which terminated the War of the Spanish Succession, gave Gibraltar and Acadia to England, together with Minorca, which was finally restored to Spain in 1783.

With the accession of the house of Hanover (or of Brunswick), in the person of George I, came a long supremacy of the Whig party, which was a combination of the great landed aristocracy with the industrial classes of the towns, while the strength of the Tories consisted in the support of the country gentry. The Whigs derived their strength from the boroughs, the more important of which numbered Dissenters among their industrial population, while the pocket boroughs, often inconsiderable hamlets, were either directly under the control of the neighboring magnates, usually Whigs, or else purchasable by them. As the Tories favored the house of Stuart, the first Georges were compelled to choose their ministers from the Whigs. They were more interested in their German than in their English possessions, and as long as they were supported by England in their continental designs they were quite willing to allow the English ministry to do as it pleased in regard to home affairs. The cabinet ceased to hold sessions in the King's presence, and by degrees his place as head of the council came to be filled by one of its members. This member was usually the guiding spirit of the cabinet. He chose the ministry and distributed the royal patronage. He and his ministry were responsible to Parliament alone.

The first act of the Whig Parliament of 1715 was the impeachment of Tory leaders for treasonable correspondence with the exiled house of Stuart. Oxford was sent to prison, Bolingbroke and Ormond fled to France. The rebellion of 1717, in favor of the son of James II, was easily suppressed in Scotland and northern England. In 1716 the same Parliament prolonged its power by an Act providing for septennial parliaments, and in 1719 it provided relief for the Dissenters by the repeal of the Occasional Conformity Act and the Schism Act. In 1720 a mad wave of speculation in shares of the South Sea Company swept over the country, based on exaggerated notions of the value of the trade with the Spanish colonies in South America. The ministry had allowed the national debt to be incorporated with the stock of the company, with a promise that the debt should be extinguished in 25 years, and when the bubble burst it was forced to resign. A partial relief for the sufferers was provided by the able administration of Sir Robert Walpole (q.v.), who was the virtual head of the

new cabinet. For 21 years this astute man was the guiding spirit in English politics. By his ability as a financier he greatly promoted trade and commerce, and incidentally he made cabinet government a working system and caused the House of Commons to become more important than the House of Lords. He avoided exciting popular feeling, even withdrawing measures of undoubted excellence because of the prejudice against them; as, e.g., his Excise Bill in 1733, which provided for the regulation of import duties in government warehouses. With great reluctance he permitted the popular feeling in 1739 to involve the nation in the Spanish War, but resigned in 1742 rather than embark in a second war, that of the Austrian Succession. In his previous peace policy he had had the support of the nation, although he had never hesitated to maintain his majorities by making use of corruption. Carteret was the actual head of the next ministry, a short-lived one. His participation in the War of the Austrian Succession was indeed fortunate for Hanover, but brought neither glory nor profit to England. During this war occurred the daring invasion of the Young Pretender, Charles Edward Stuart. At the head of the Highland clans he gained a brilliant victory over the royal forces at Prestonpans in 1745 and advanced into England as far as Derby, but was finally forced to withdraw to Scotland and was overthrown at Culloden in 1746. In 1745 began the struggle between England and France for dominion in India.

After Carteret had been compelled to resign, and the great Whig family of Pelham had shown its incapacity, and the Duke of Newcastle had demonstrated his incompetence to rule by corruption, Pitt entered the cabinet in 1756. Although nominally a Whig, he was in reality above party ties. The middle class trusted him and formed his strongest support. He was hostile to France and took active part with Frederick the Great in the Seven Years' War, in which the French were deprived of Canada, which became English, and of Louisiana, as well as of their power in India. He resigned in 1761 because the cabinet refused to follow him in the declaration of war with Spain, which he considered inevitable. In the course of the Seven Years' War and the ensuing years Clive laid the foundation of a great British empire in India.

The Struggle against Democracy, 1760-1820. Meanwhile in 1760 George III had ascended the throne, with the fixed design of restoring as far as practicable the royal prerogatives which his two predecessors had allowed to slip from their grasp. He was determined to break up the party system as it then existed, to destroy the Whig oligarchy, and by selecting his own ministers exert a determining influence in English politics. Resuming the royal patronage, he had soon formed a party of adherents, the "King's friends," who looked to him for political guidance. Availing himself of dissensions within the Whig party, he forced Lord Bute, his favorite, into the cabinet as Prime Minister, but the latter showed incapacity and had to resign. At last the King found in Lord North a minister through whom he could carry out his ideas. Under the North ministry the American War of the Revolution was waged, and England, through stubborn adherence to her old colonial policy, lost her most valuable colonies. With the greatest reluctance the King

allowed the Rockingham ministry, with Fox as its leading spirit, to be formed. He was opposed to Fox's grant of legislative independence to Ireland, and the actions of Shelburne, backed by the King's influence, caused the disruption of the ministry before the completion of the negotiations of the Treaty of Paris, 1783, conferring independence upon America. By his personal influence again the King overthrew the coalition ministry of Fox and North, and in the face of a hostile majority appointed the younger Pitt Prime Minister.

Although the King did not always approve Pitt's measures, they were agreed in the general policy to be pursued. Pitt's India Bill in 1784 reduced the power of the East India Company by submitting its political measures to the control of a commission named by the King. Although at first he was not in favor of the war against the French Republic, he soon became its principal advocate. He was joined by a majority of the Whigs, the most influential of whom was Burke. Fox, however, remained his opponent, arguing that the demands of the democracy should be met by reforms at home. The revolt in Ireland, in connection with this war, resulted in the Act of Union in 1800, but Pitt was compelled to resign because the King was unwilling to sanction Catholic emancipation in that country, which was one of the terms upon which Pitt proposed the union. He soon resumed power, however, and the war against Napoleon was prosecuted vigorously and with success. Nelson conquered at Trafalgar, and Wellington drove the French out of Spain. The Congress of Vienna allowed England to retain a large part of the territories (Cape Colony, Ceylon, British Guiana), gave her Mauritius, Tobago, and St. Lucia, and confirmed her in the possession of Malta, which she had wrested from the French in the course of the French wars. But while the war against Napoleon, simultaneously with which a less successful conflict was waged with the United States (1812-15), confirmed the naval supremacy of England, it entailed upon the country an enormous debt, at a time when the great body of common laborers were in dire distress as a first result of the industrial revolution that followed from the introduction of the spinning machine (1764), the weaving machine (1785), and the steam engine. For five years following Waterloo it was the policy of the government to suppress the unrest, while the masses, on the other hand, were threatening political revolt. In 1815 the first Corn Law, in the interest of the landowners, forbade the importation of corn until the price of the domestic product should rise to 10s. a bushel. In 1817 the Habeas Corpus Act was suspended; in 1819 occurred the Manchester Massacre, and the notorious Six Acts, by which meetings for the consideration of grievances were suppressed, were enacted. In 1820 George IV, who had been appointed Regent for his insane father in 1811, ascended the throne.

Democracy and Reform, 1820 till the Present Time. With the accession of Canning to the Foreign Office in 1822, England again entered upon a more liberal policy by opposing the Holy Alliance between Russia, Austria, and Prussia for the suppression of democracy. In 1824 she acknowledged the independence of the Spanish colonies. Assistance was afforded to the Greek patriots in their uprising against Turkey in 1827. In 1823, under Sir Robert Peel, an enlightened

Tory, the criminal law was radically reformed by the abolition of the death penalty for about 100 crimes, most of which were trivial offenses.

The combination laws, which prohibited any workmen's associations, were repealed in 1825, and thus the way was paved for the trades-unions that followed. In 1823 and again in 1825 the import duties were materially reduced. Both of these measures were brought about through the instrumentality of John Huskisson, President of the Board of Trade.

During its long exclusion from office the Whig party had changed from the close oligarchy of the eighteenth century and had become the advocate of democratic reforms. Lord John Russell, its most energetic leader, waged a long struggle in Parliament for liberal measures, and it was largely owing to his efforts that the Corporation Act and the Test Act, under which Catholics and Dissenters had been excluded from all corporate offices, were repealed in 1828 by a Tory ministry, headed by the Duke of Wellington. In 1829, in consequence of the O'Connell agitation for the separation of Ireland from Great Britain, Catholic emancipation was granted. At length, in 1830, a few months after the accession of William IV, the Whigs, by a fusion with the more advanced Conservatives (Canningites), returned to power with Earl Grey as Premier. His ministry was celebrated for the number of reforms it introduced. In 1831 Lord John Russell introduced the first Reform Bill in the House of Commons, which, after an appeal to the country, was indorsed by an overwhelming majority and, notwithstanding the opposition of the Lords, became a law in 1832. In its final form this law took away the franchises of 56 boroughs and reduced the membership of 32 others, distributing this representation among the larger towns and more populous counties, and it increased the number of voters from 430,000 to 650,000. By these measures it transferred the balance of political power to the middle classes of the towns.

In the next election the Ministerialists received an overwhelming majority. This majority was composed of two groups, the Radicals and the Whigs, who assumed the common name of Liberals. A number of important reforms were introduced. The number of bishops of the Established church of Ireland was reduced from 22 to 12, and certain ecclesiastical taxation was levied on the clergy, instead of being levied on the population at large. In 1833 slavery was abolished in the colonies, and a compensation of £20,000,000 was given to slaveowners. In the same year the first Factory Act, limiting the labor of children to eight hours a day, was passed through the efforts of Lord Ashley, and in 1834 the new Poor Law, abolishing outdoor relief and charity to the able-bodied, was enacted. The Liberal ministry of Lord Melbourne, which came to power in 1835, also enacted a Municipal Corporations Act providing for the election of corporations by the ratepayers, in place of the old method of self-election. In 1837 a rebellion in Canada gave occasion for uniting the provinces of Upper and Lower Canada into one province, under a new constitution which embodied the essentials of internal self-government. In 1838 the principles of the English Poor Law were extended to Ireland, and a Tithe Act was passed, levying the tithes on the landlord instead of on the tenants. During this reform period the foreign

policy, which was directed by the brilliant Lord Palmerston, acted as a check on the absolute governments of Russia, Austria, and Prussia. His support of the Sultan of Turkey against Egypt, however, brought about an estrangement with France. With the accession of Queen Victoria in 1837 the Kingdom of Hanover, not allowing a woman to occupy the throne, became detached from England.

In 1839 the Chartists (see CHARTISM), a body of radical reformers, presented to the House of Commons their petition for manhood suffrage, vote by ballot, annual parliaments, the abolition of property qualification, the payment of members, and equal electoral districts. In 1841 the new Conservative party came to power under Sir Robert Peel. It was composed of the Tories and of the more conservative Whigs under the leadership of Lord Stanley, afterward the Earl of Derby, who had left the Liberal party. By anticipating the plans of the Liberals the Conservatives sought to make reforms, but in accordance with their own principles. In 1842 and 1845 Peel further reduced the protective tariffs, providing an income tax to meet the ensuing deficiency in the revenue. The conditions of women and children employed in the mines were improved by the efforts of Lord Ashley in Parliament. In consequence of the spirited campaign against the Corn Laws by the Anti-Corn-Law League, which was headed by Richard Cobden and John Bright, and under the stress of the Irish famine, Peel went so far as entirely to repeal the import duties on corn in 1846. In this measure he was supported by the Liberals, but opposed by the majority of his own party, which represented the land interests. He was consequently overthrown; but the Liberal ministry of Lord John Russell, which followed, introduced no measures of importance, either to relieve the tenant farmers in Ireland or to enlarge the suffrage in accordance with the demands of the Chartists in England. The foreign policy of all reform ministries had been one of hostility to Russia. The invasion of Afghanistan in 1839, intended as a measure against Russian aggression, resulted in the disastrous retreat from Kabul and the annihilation of a British army in 1842—a humiliation in a measure retrieved by the subsequent successes of the British. England's alliance with France in the Crimean War (1854-56), by which Russian aggression against Turkey was checked, was actuated by the same motives. The leading statesman identified with this aggressive policy was Lord Palmerston. In the early part of the reign of Victoria the British Empire in India expanded with giant strides, Sind, the Punjab, and Oudh being annexed between 1843 and 1846. The Opium War with China (1840-42) gave Hongkong to England. In 1857 occurred the terrible mutiny of the Indian Sepoys, the native troops in British employ. On the suppression of the mutiny Parliament put an end to the authority of the East India Company by making India a crown colony. Its Governor-General (henceforth Viceroy) was brought directly under the British monarch.

During the third Derby ministry Disraeli, its real leader, carried the Second Reform Act, by the aid of the Liberals, in 1867. This Act established, practically, household suffrage in the towns, thus giving to the workingmen a voice in political affairs, and greatly enlarged the suffrage in the country. The first ministry of

Gladstone, which followed (1868-74), resembled the ministry of Earl Grey in the number of reforms it inaugurated. The attempted Irish revolutions of 1848 and 1867 (see FENIAN SOCIETY) had convinced Gladstone of the necessity of the redress of Irish grievances. In 1869-71 the Irish church was disestablished and disendowed. A Land Act in 1870 compelled landlords to compensate tenants for improvements in cases of eviction and provided for government loans to tenants wishing to buy their holdings. Forster's Education Act provided for national primary schools and for compulsory attendance, in place of the public aid which had previously been given to private institutions. The purchase of positions in the army was abolished in 1871, and the Ballot Act of 1872 instituted secret voting at elections. Gladstone's foreign policy was weak but pacific. He allowed Russia to abrogate her treaty obligations guaranteeing neutrality in the Black Sea, and he settled the *Alabama* claims by the payment of \$15,000,000 to the United States, in accordance with the decision of a court of arbitration which sat at Geneva in 1871.

The second ministry of Disraeli (1874-80), on the other hand, was noted chiefly for its aggressive foreign policy. He had Queen Victoria proclaimed Empress of India in 1877. His interference robbed Russia of the fruits of her victory over Turkey in 1878 and secured Cyprus for England, and in the same year he made war upon Afghanistan, whose sovereign was leaning towards Russia. In Africa a controlling interest in the Suez Canal was acquired, the Transvaal was annexed (soon, however, to be set free), and the Zulus were subdued. In his second ministry (1880-85) Gladstone also was compelled to extend the Empire by suppressing the revolt of the native Egyptians under Arabi Pasha against the dual control of the finances of Egypt by France and England. As a result of this war Egypt came under British control. Forster's Land Act of 1881 provided for free sale, fair rents, and fixity of tenure in Ireland, and the Third Reform Act in 1884 gave to the country the universal suffrage already practically established in the towns.

Subsequent legislation has been largely democratic in character. The local government measures (1888, 1892, 1899) took the local government out of the hands of the gentry by the establishment of county councils (q.v.) elected by the people. Under this act Greater London at last received the self-government it had so long deserved by being organized as a county. The proposed Home Rule acts were a result of the demands of the great majority of the Irish people under the leadership of Charles Stewart Parnell. Gladstone's first act, in 1885, was rejected by the Commons, and caused the disruption of the Liberal party. A strong minority, under the leadership of Lord Hartington and Joseph Chamberlain, revolted and, assuming the name of Liberal Unionists, joined the Conservatives. Gladstone's second Home Rule measure (1895) was accepted by the Commons, but rejected by the Lords, and the next general election returned the Conservatives to power with Salisbury as Premier. The aggressive policy of Joseph Chamberlain, the Colonial Secretary, involved the nation in a bloody war with the two Dutch republics of South Africa in 1899. (See SOUTH AFRICAN WAR.) The struggle which opened with serious British reverses nevertheless

ended in the subjugation of the Boers. In the course of this struggle Queen Victoria died, Jan. 22, 1901, and was succeeded by her son, Edward VII.

In 1902 a new Education Bill was enacted in spite of violent opposition on the part of the Liberal and Nonconformist elements aroused by the extensive favors the new measure conferred on the Anglican denomination. In 1903 a Land Act for Ireland was passed, providing the sum of £100,000,000 for distribution in the form of long-term loans to tenants for the purpose of enabling them to acquire ownership of the land they occupied.

In 1903 Joseph Chamberlain injected a momentous question into the sphere of party politics by bringing forward suggestions for an alteration in the fiscal arrangements of the country, equivalent to the abandonment of the time-honored system of free trade. For the purpose of bringing about closer relations between the United Kingdom and its colonies so as to enable British interests more effectually to compete with the growing rivalry of Germany and the United States in the commercial field, as well as to establish an effective system of Imperial defense, he proposed that, in exchange for preferential tariff treatment of British manufactures by the colonies as against foreign manufactures the United Kingdom should impose a duty on food imports from foreign countries and admit colonial produce free. The tariff question was debated extensively in Parliament throughout 1904 and 1905 with no other result than that of emphasizing the unpopularity of Chamberlain's views. In December, 1905, the Balfour cabinet found its position untenable and resigned. A Liberal ministry was organized by Sir Henry Campbell-Bannerman (q.v.), who immediately thereafter appealed to the country. The general election of January, 1906, was fought out on the issues of tariff reform, repeal of the Education Bill of 1902, and the policy of the Unionist government in the matter of admitting Chinese labor into the Transvaal, and resulted in an overwhelming defeat for the Unionist party, the Liberals receiving a majority of over 300. In April, 1906, the government introduced an Education Bill which dealt radically with the question of religious instruction in the schools and in a spirit acceptable to those who had opposed the bill of 1902. The measure was passed by a large majority in the House of Commons, but in the House of Lords it was bitterly assailed by the Anglicans and so radically amended that it was dropped, not, however, without producing strained relations between the Lords and the government and agitation on the part of the Radicals for the abolition of the Upper House.

In the sphere of foreign politics British prestige, which had suffered badly in the course of the South African War, reached a higher point than ever in the three years following the conclusion of peace with the Boers. In the East Great Britain appears as the ally of triumphant Japan, with which treaties were concluded in 1902 and 1905. (See JAPAN.) Its position in India was strengthened by the second of these two treaties, by the confirmation of treaty relations with the Ameer of Afghanistan in 1905, and the establishment of trade relations with Tibet (q.v.) in 1904. Its position in Egypt was improved by the agreement of April 8, 1904, with France, in which the latter power gave its con-

sent to the indefinite continuance of the status quo, and by the enforcement of British claims to the Sinai territory against Turkey in 1906. The agreement of 1904 with France was of primary importance for European politics also as marking the establishment of peculiarly intimate relations between the two Powers in their opposition to German policy.

The strained relation between the government and the House of Lords continued unabated, and in 1907 the government resolved that the powers of the Lords in rejecting and delaying legislation ought to be checked. The same year Herbert Henry Asquith, in preparing the budget, reduced the tax on incomes directly earned in comparison with that on incomes derived from real property and from investments. When Campbell-Bannerman died, in 1908, and was succeeded by Asquith, there was another failure to pass an Education Bill, and although the Lords agreed to an Old Age Pension Bill, which had been formerly promised by the Unionists, they rejected a bill from the Commons for reducing by one-third the number of houses licensed to sell intoxicating liquors. In 1909 David Lloyd-George, the new Chancellor of the Exchequer, in preparing a budget that would enable England to meet the increasing naval efficiency of foreign powers, greatly increased the tax on liquor licenses, increased the tax on incomes exceeding £5000 a year, and laid a tax on land calculated to appropriate to the use of the state a portion of the unearned increment. The Lords, accepting this budget as a challenge, threw it out. The government went twice to the country in 1910 with the issue and was sustained each time. The same year Edward VII, who was one of the most sagacious occupants of the English throne since William III, died and was succeeded by George V. In 1911 the House of Commons, considering itself authorized to settle its difficulty with the House of Lords, passed a Parliament Bill depriving the Lords of practically all power over money bills and providing that any other bill which passes the House of Commons unchanged in three successive sessions of the same or successive parliaments does not require the assent of the Lords to become a law. The Parliament Bill passed the Lords under a threat to create new peers if necessary, and the first important measures to pass into laws under the operation of this somewhat revolutionary Act were a Bill disestablishing the Anglican church in Wales (1914) and a Home Rule Bill for Ireland (1914). (See *Government*.) To meet the threatening violent opposition to the latter Act by the Protestants of Ulster the House of Commons passed in 1914 an Amending Bill allowing the electors of each county of Ulster to decide whether or not their county shall be excluded from the operation of Home Rule for a period of six years. Another part of the radical programme of the Liberals was the National Insurance Bill, passed in 1912, and providing both national health insurance and unemployment insurance. For several years the militant branch of the woman's suffrage movement had been a disturbing factor in political and social England, but apparently without enhancing the cause.

The great war which began in 1914 came at a most inauspicious moment for the United Kingdom. Ireland was on the verge of civil war, the army was in a poor condition, and the vast increase in naval appropriations, together

with the disagreement with the colonies over the naval policy, presented serious internal problems. A Suspensory Bill was passed which suspended from operation the Home Rule Act and the Welsh Disestablishment Act until 12 months from the passage of the acts or "until such later date (not being later than the end of the present war) as may be fixed by His Majesty by Order in Council." In 1915 the operation of the Acts was definitely suspended until the close of the war. War measures were passed providing for authorization of war credits; a Defense of the Realm Act, aimed against espionage; government control of the railroads and a strict censorship of the press.

Three great problems faced the British government in 1915, viz., finances, supply of munitions, and the recruitment of the army. (For a full treatment of the first of these, see WAR IN EUROPE.) By April, 1915, 750,000 men of "Kitchener's Army" had been sent to the front. However it was soon evident that Great Britain was not supplying enough men to meet the task assigned her in western Europe. Conscription, as opposed to volunteer enlistment, was proposed by many prominent men, although the cabinet seemed loath to take it up. The last three months of 1915 witnessed a great campaign for recruits, known as the Derby Recruiting Campaign. It was conducted by Lord Derby* and was the final effort of the government to avoid forcing conscription on the unwilling workmen. Lord Derby estimated that his campaign yielded 831,062 men. In January, 1916, the Military Service Bill was introduced, which provided that all bachelors and widowers (having no children dependent on them), between the ages of 18 and 41, were liable for military service. Ireland was excluded. The Laborites and Miners' Federation were bitterly opposed to the Bill. It was passed by a majority of 4 to 1 on its first reading. Premier Asquith postponed action on the Conscription Bill until May, 1916, when it was again introduced, and passed.

The supply of munitions was undeniably inadequate to meet the needs of the new army, although the rate of production was rapidly increased. Agreements were made with the labor unions by which semiskilled and female labor could be used without any discriminations against the unions. The government took over the control of all factories which were capable of producing war munitions. Nevertheless strikes and lockouts caused serious losses of time and supplies. A Munitions Act was passed which provided for government supervision of all manufacturing and which made strikes and lockouts illegal and proposed government arbitration for all disputes.

In May, 1915, a cabinet crisis occurred over the quarrel between Winston Churchill, First Lord of the Admiralty, and Lord Fisher, First Sea Lord. The result was the formation of a coalition cabinet. Eight members of the cabinet were asked to resign, and eight Unionists were brought in. Two new positions were created. (See *Government*.) The new cabinet consisted

of 12 Liberals, 8 Unionists, 1 Labor member, and Lord Kitchener, who lost his life on June 5 when the *Hampshire* was lost off the Orkney Islands. In the course of the year Winston Churchill and Sir Edward Carson resigned. In December, 1915, Parliament introduced a Bill to prolong its life for 12 months. By a later compromise this was reduced to eight months.

In April, 1916, a serious outbreak occurred in Ireland. It was presumably engineered by Sir Roger Casement† in Germany. He was captured as he was about to land in Ireland from a German vessel, tried by court-martial, and sentenced to death. The Irish organization behind the revolution was the Sinn Fein (the Celtic equivalent for "ourselves alone"). It is a revival of the Young Irish movement of 1848 and opened a branch in New York City in 1907. It is a society whose purpose is purely national and is opposed to Home Rule for Ireland on the grounds that it is too conservative. Being nonsectarian, it hoped for an Irish republic which would appeal both to the Irish Catholics and the Ulster Protestants. The rebels seized many buildings in Dublin, and several insurrections broke out in other parts of the country. Martial law was declared and troops were immediately sent over from England. After several days of street fighting and the destruction of many buildings, the government troops were in control of the situation. Some of the leaders were taken to England, tried by court-martial, and shot.

As a result of the activities of spies, and in consequence of the violent popular excitement caused by German Zeppelin raids and submarine warfare, a strong tide of anti-German feeling swept over the British Empire. For the diplomatic, military, economic, and financial aspects of the war, see WAR IN EUROPE.

UNITED PROVINCES OF AGRA AND OUDH, formerly NORTHWESTERN PROVINCES AND OUDH. A province of British India, in the Upper Ganges valley (Map: India, D 3). Total area, 107,267 square miles, of which 83,109 belong to the Territory of Agra, 24,158 to Oudh. They surround the native states of Garhwal, 4180 square miles, and Rampur, 899 square miles. Except the extreme northern part, which is a wild and elevated mountain region of the Himalaya, the province is a low alluvial plain watered by the Ganges and its numerous large parallel tributaries, chief of which is the Juma. The climate is hot and unhealthy, especially in the large jungle region below the mountains. The soil is fertile, but the western and southern parts of the province have a very uncertain rainfall, and are subject to severe droughts, so that these regions would be practically a desert were it not for many large streams.

Extensive irrigation works have been constructed. The total area cropped in 1912-13 was reported as 44,431,737 acres, of which 9,646,374 acres were irrigated. The area irrigated by wells was 5,514,879 acres and that by government canals 2,234,207 acres, the latter being entirely in Agra. The principal crops are of more nearly equal importance than in the other provinces. The United Provinces rank next to the Punjab as a wheat producer, the area under wheat in 1912-13 being 7,442,486 acres. Rice, though of much less relative importance than in Bengal and some other parts of India, covered 6,812,004 acres. Other acreages in 1912-13 were: barley, 4,643,334; grain, 5,507,486; spiked millet, 2,617,439; great millet, 2,169,370. The United Provinces have an area under sugar cane nearly four times as large as that of the Punjab, which stands second, the area under sugar cane in the former being, in 1912-13, 1,424,064 acres and in the latter 367,373 acres. Other crops include maize, cotton, opium, and indigo. The people eat little animal food, and stock raising is of subsidiary importance. Cattle and buffaloes take the place of horses. Mining is of little value.

Modern methods of manufacturing have been seldom adopted. For 1912 there were reported 201 factories, with 54,803 employees (of whom 6328 were women, 1693 children). The more important factories are cotton mills, especially in Cawnpore. The Ganges affords a means of water transportation. The province is better supplied with railroads than any other in India. It exports large quantities of oil seeds, wheat, raw cotton, hides, sugar, indigo, and opium, and imports cotton goods, metals, railroad materials, coal, and salt. A frontier trade is carried on with Tibet and Nepal.

The United Provinces are under the administrative control of a Lieutenant-Governor, appointed by the Governor-General, with the approval of the crown. There is a legislative council of 50 members (21 official, 27 unofficial, 2 experts). The provinces are divided into municipalities and districts administered by boards, a large part of whose membership is elective. The police force in 1912 had a sanctioned strength of 35,926 officers and men. The capital of the United Provinces is Allahabad.

The population of the United Provinces was

46,905,512 in 1891, 47,692,277 in 1901 (increase 1.7 per cent), and 47,182,044 in 1911 (decrease 1.1 per cent). Agra in 1911 had 34,624,040 inhabitants, and Oudh 12,558,004. The population of the United Provinces native states was 792,491 in 1891, 802,097 in 1901 (increase 1.2 per cent), and 832,036 in 1911 (increase 3.7 per cent). In the United Provinces and the native states respectively, Hindus numbered, in 1911, 40,253,433 and 583,599; Mohammedans, 6,658,373 and 246,358; Christians, 177,949 and 1745; Jains, 75,427 and 308; Sikhs, 15,160 and 20. There are more large cities in the United Provinces than in any other division of British India. City populations, with cantonments, were as follows in 1911: Lucknow, 259,798; Benares, 203,804; Agra, 185,449; Cawnpore, 178,557; Allahabad, 171,697; Bareilly, 129,462; Meerut, 116,227.

UNITED STATES. The order of treatment and scope of the article are indicated by the following main topics: Natural Features, Climate, Flora, Fauna, Geology, Soils, Fisheries, Mineral Resources, Agriculture, Manufactures, Transportation, Commerce (Foreign and Domestic), Shipping (Foreign and Interior), Government, Finances, Army, Navy, Population (including Interstate Migration, Sex, Density, etc.), Religion, History. Much of the material is treated to a greater extent and in more minute detail in other parts of the work under separate headings. Adequate cross references are provided throughout, which should be followed up should the reader desire to make a more exhaustive study of the whole subject or any one phase of it.

The territory of the United States of America, exclusive of Alaska and colonial dependencies, lies in the temperate portion of North America, but reaches to within one degree of the tropical zone. It extends approximately from long. 67° to 125° W. from the Atlantic Ocean (whose great arm, the Gulf of Mexico, forms half of the southern boundary) to the Pacific. The northern boundary is somewhat arbitrary in the east between New England and the lower St. Lawrence region, but from northern New York it follows the St. Lawrence and the middle line of the Great Lakes to northern Minnesota. Beyond the Lake of the Woods the boundary follows the 49th parallel to the Pacific Ocean. Key West, the southern point of Florida, has a latitude of 24° 33', and the southern part of Texas about 26°, north latitude. The parallel 49° is about that of Paris, while the latitude of Key West reaches south into the Sahara. New York is on the parallel of Naples and Constantinople, and Memphis on that of Gibraltar. The length of the boundary of the United States pro-

per is given by the Coast and Geodetic Survey as 10,758 miles. This is divided as follows: Atlantic Ocean, 1883; Pacific Ocean, 1316; Gulf of Mexico, 1639; Canada, 3900; Mexico, 1975. The country has preponderatingly a natural boundary of salt and fresh waters. On the side of Mexico and of British Columbia the boundary

crosses the Cordilleran ranges. The land and water area of the United States proper and its noncontiguous territory is shown by preceding figures. This article treats of the United States proper except when otherwise stated. Alaska and also the colonial dependencies are treated under their respective heads.

NATURAL FEATURES

General Description. The lands of the United States are crossed from north to south by the four principal physiographic provinces of the North American continent: (1) on the east, bordering the Atlantic, coastal plains and plateaus; (2) west of these, the Appalachian highlands extending from the Gulf of Mexico into Labrador; (3) a great system of plains and plateaus extending from the Gulf of Mexico northward to the Arctic, bordered on the east by the Appalachians and on the west by the Rocky Mountains; (4) a group of mountain chains and ranges on the west side of the country, including the Rocky Mountains, Sierra Nevada, Cascade, etc. (called the Cordilleras). These western highlands are so prominent and so extensive that the United States may be viewed as divided into two parts by the 100th meridian—the eastern part being a lowland plain with slight elevations in the Appalachian system, and the western standing at an elevation of 4000 to 6000 feet, with large areas over 10,000 feet.

Atlantic Lowland.—This region, although not large, contains a vast population and is historically the most important. It made the interior of the continent accessible to discovery from the east, offered hospitable ground to the colonists, and in the north is rich in the harbors that have led to the building of cities and the growth of commerce. The Atlantic lowland includes the piedmont plain. The latter extends south from New York to Florida Strait, including southern New Jersey, Delaware, and a broad belt of all the South Atlantic States. It is a smooth land, without projecting masses of rocky hills, and slopes gently up from the tide levels to the rougher lands of the Appalachian belt. It is intersected by Delaware and Chesapeake bays and their rivers and by more southern streams. It is often known as the tide-water country because the sea enters its estuarine rivers for scores of miles. It is covered with fields of tobacco, cotton, rice, and fruit orchards or with pastures or native forest. The region is in greater part a sea bottom uncovered at a comparatively recent period and becomes continuous, beneath the Atlantic waters, with the continental shelf which lies between the land border and the deep seas. North of New York in New England and west of this plain is a much denuded belt of ancient Appalachian mountains which is known as the piedmont plain. New England, which is generally treated as a distinct physiographic province, is a rough lowland rising from sea level to the height of 400 or 500 feet. It is naturally dissected, upland country. By the piedmont plain is usually understood the land between the coastal plain and the Blue Ridge. See **PIEDMONT PLAIN**.

One feature of the entire Atlantic coast is that the rivers are tidal. They may occupy narrow channels to the sea border, like the Hudson, or they may enter at the head of deep and spacious bays, as do the Delaware and the Susquehanna. Such a water system with the above rivers, the Potomac, James, and other streams,

is well called a drowned river system. By this is meant that the trunk valley and its branches were submerged by the sea entering their lower parts because of a sinking of the edge or of larger parts of the continent. The historical meaning of these conditions can hardly be reckoned. It is enough here to observe that nearly all the harborages and quiet salt waters of the Atlantic border have this origin, and that thus have grown the great seaboard cities, where ships may ride safely at the mouth of tidal streams whose waters offer gateways to the interior of the continent.

Appalachian Mountains.—From the physical point of view these may be taken as the eastern part of the rocky skeleton of the country and the continent. In their highest points, the White Mountains in the north and the Black Mountains in the middle south, they attain elevations exceeding 6000 feet in the loftiest projections east of the Rocky Mountains. Historically they form the Appalachian barrier, with large consequences in Colonial annals and in the opening of the lands that lie westward. See APPALACHIANS.

Central Lowlands.—The central part of the United States between the Appalachians and the 100th meridian is commercially a unit and a great agricultural section. The plains in this region pass gradually up into the plateau on the east. To the north they merge with the smooth lowlands about the Great Lakes, to the south they are continuous with the Gulf lands, and to the west they pass gradually into the high plains west and south of the Missouri River. The region is roughly coterminous with the prairies. See PRAIRIE.

Great Lake Region.—The lands about the Great Lakes have considerable variety. During the recession of the continental glacier the lakes had higher water levels and often much greater extent than now. During this flooded condition what are now the bordering lands received a cover of such fine muds as are spread upon the bottom of all great bodies of water. To some extent previous inequalities are masked, and the resulting surface is often very smooth and almost level. This is especially true of Lakes Ontario, Erie, Huron, and Michigan. Some of these lands were treeless and hence were properly called prairies, although modern physiography prefers to designate them as lake plains. Lake Superior is surrounded by older rocks, which have been greatly disturbed and metamorphosed, and the remnants of these ancient mountains form a higher and rougher land than about the lower lakes. This is true of the northern peninsula of Michigan, of Wisconsin, and of northeastern Minnesota. Naturally, therefore, these rocks hold vast stores of iron and copper, while the strata of the prairies offer little in the way of mineral resources except coal. See GREAT LAKES.

Gulf Plains.—These are most simply defined as a continuation of the Atlantic coastal plain, or another part of the younger fringe of the continent. In central Georgia and Alabama the younger formations abut on the older rocks of the southern Appalachians and mark approximately the encroachment of the later seas. By gentle uplift the marginal sea bottoms of the Gulf were laid bare and form the flat lowlands of this semitropical region. Before the uplift Florida existed as an extension of the submarine platform which probably extended to Cuba

and beyond. Its limestone strata have resulted in cavernous openings in the rocks, underground streams, and springs of great volume. The seaward edge of this land abounds in sand bars, coral reefs, and mangrove swamps, and this single State, counting its main shores, its bays and numberless islands, has more than 4000 miles of shore line.

Westward from Alabama the Mississippi River (q.v.) becomes the controlling feature in the topography of the Gulf region. The broad Gulf plain occupies a large part of southern and eastern Texas. As in the region to the eastward, the younger rocks have been made into land by uplift and retreat of the sea. As a rule the surface slopes gently towards the Gulf, but with escarpments and great local variations of topography. Some areas are prairie, while others are heavily forested, and the rise to the northwest leads first to the great plateau, or Llano Estacado, and then to the mountains of the Rocky Mountain Range. The shore line is a long crescent, bordered by extensive barrier beaches and sand bars, which inclose stretches of quiet water. Galveston is on one of these beaches, and it is thus exposed to the Gulf hurricanes.

Great Plains.—This is the name usually given to the lands which rise gradually from the prairies to the eastern base of the Rocky Mountains. But the altitude of these lands is such that they are often called the high plains. From altitudes of about 1000 feet along the Missouri River in Kansas and Nebraska, they rise to heights of 5000 to 6000 feet at the foot of the western mountains. In general this rise is imperceptibly gradual, but its continuity is sometimes interrupted by escarpments, and the easterly flowing rivers have incised shallow valleys upon the region. The strata are little disturbed, and thus the country resembles the prairie region, but the underlying beds are geologically younger and are overlain in many areas by large bodies of waste, which in part may have been deposited in lakes and in part was no doubt distributed by torrents from the mountains. Climatic causes have also made the region different in aspect from the prairies. The plains have from 10 to 20 inches of rain per year; therefore forests are infrequent, the vegetation consists largely of sparse grasses, and agriculture is altogether dependent on irrigation. Over large areas the water supply for this purpose is deficient and grazing is the only remaining resource. This region is a vast one, having the east and west limits already given and reaching from central Texas to the north border of the country, where it merges into the great western plains of Canada. In the north the most prominent break in the plains is the Black Hills mountain area. Here an elevated mass of ancient rocks protrudes through the younger strata, giving a region of rugged relief, hard rocks, mines, and forests. In the Black Hills region, in much of the western Dakotas, and in Montana and western Nebraska, are the Bad Lands (q.v.).

Uplands of Missouri and Arkansas.—The most extensive body of elevated land between the Appalachians and the higher levels of the great plains lies in southern Missouri and in northern and central Arkansas and westward. In Missouri and northern Arkansas these uplands are of moderate height, dissected by the rivers, covered with forests, and known as the Ozark plateau. Still better known, owing to their metallic

deposits, are some low mountains of very ancient rocks, outliers of the Ozarks, familiar as Iron Mountain and Pilot Knob. Running through southern Arkansas are the Ouachita Mountains. These rise from below the young sediments of the Mississippi valley and trend westward, passing through Indian Territory and Oklahoma into northern Texas. This upland region south of the Missouri River, therefore, is associated on various sides with the prairies, the alluvial plains of the Mississippi, the Gulf plains of the South, and the great plains of the West.

Rocky Mountains.—The name is properly applied only to the eastern ranges of the Cordilleras. The ranges with numerous peaks rising above 14,000 feet extend through Idaho, Montana, Wyoming, Colorado, and New Mexico and send some outlying ridges into Texas. See **ROCKY MOUNTAINS**.

Colorado Plateaus.—West of the Rocky Mountains, in Colorado, Utah, New Mexico, and Arizona, are the Colorado plateaus. The prominent and general characteristics of the plateaus are the flat but partially dissected upper surfaces of the various parts, the distinct boundaries of the individual plateaus as marked by fault scarps, and the great cañons that ramify through almost every section. The most striking feature of the plateaus is the Colorado River with its world-famed cañon. This great stream confines its drainage, save near its mouth, to an upland several thousand feet above the sea. Having abundant sources in the rains and snows of the various parts of the Rocky Mountain Range and rising at great altitudes, it has both velocity and volume and hence has cut deeply into the plateaus. This being an arid region, the abundant waters are of remote derivation and sunk in the cañons, while the sparse rainfall causes desert conditions to be general, with much exposed rock, little vegetation, and a general absence of conditions favorable to civilized life. Closely associated with these great plateaus are two short lofty ranges of mountains. One of these is the Wasatch, marking the boundary between the plateaus and the Great Basin in central Utah. The other is the Uinta Range, about 150 miles in length and extending from northwestern Colorado through the borderlands of Wyoming and Utah. Its chief development is in the latter State, and in its east and west trend it departs from the usual direction of American mountain axes.

Great Basin.—This is an area of interior drainage, made up of many minor basins, of which the chief is that of the Great Salt Lake in Utah. See **GREAT BASIN**.

Columbia and Snake River Plateaus.—Large areas drained by these streams in Idaho, Oregon, and Washington are of volcanic origin, and along the Snake River in Idaho and Oregon the lavas form plateaus about 4000 feet in altitude. They are a natural desert, since the region is arid, but are capable of great development under the process of irrigation.

Mountains and Valleys of the Pacific Coast.—The features to which reference is here made belong to three States, California, Oregon, and Washington. They will be best understood if it is observed that a single lofty range, the Sierra Nevada, forms the eastern border of California, and that it extends, under the name of the Cascade Range, northward through central Oregon and Washington. Its loftiest peak, in California, is Mount Whitney (14,502 feet),

which is the highest point of the entire United States south of Alaska. Bordering the sea are lower mountains, in the form of a series of ranges known as the Coast Ranges, parts of it being known as the Klamath Mountains in Oregon and the Olympic Mountains in Washington. (See **SIERRA NEVADA**; **CASCADE RANGE**; etc.) Between these parallel ranges are lowland valleys of the utmost importance in the development of the region. They include in California the great valley drained by the Sacramento and San Joaquin rivers, the centre of the fruit and grain culture of the State; in Oregon the Willamette valley; and still farther north the Puget Sound valley in the State of Washington. In these mountain ranges the extinct volcanic cones of Shasta, Hood, Rainier, and Baker are prominent features, and Lassen in active eruption adds a new character. The coast line of the Pacific is not nearly so great as that of the Atlantic coast, because it is less indented. It has, however, a few of the choicest bodies of inland or protected waters to be found on any shore. Such are San Francisco Bay and Puget Sound, while the deep, tidal Columbia and Willamette rivers offer similar advantages to northern Oregon. It is thus seen that the Cordilleran system is made up of many parallel ranges of mountains, separated in turn by intermontane areas of lofty plateaus and valleys, or, nearer the Pacific Ocean, by broad and fertile lowlands.

Hydrography. The drainage of the United States may be classed as Atlantic and Pacific. As with the entire continent and with South America, the smaller ocean receives by far the greater contribution of fresh water from the lands now under review. The Atlantic streams may be considered as belonging to the Hudson Bay, the Gulf, or to open-sea drainage. With unimportant exceptions farther west, the Red River of the North carries a small contribution of the United States area to Hudson Bay. The open-sea streams are all of moderate length and volume except the St. Lawrence, which, rising in Minnesota, expands into lakes of exceptional size. (For details concerning these bodies of water see **GREAT LAKES**.) All the streams which enter the lakes from the United States are relatively small. Their courses are short, which is equal to saying that the line of water partings between the Laurentian and Mississippi basins is close to the lakes. The divide is also nearly everywhere quite inconspicuous. The streams have thus small capacity for transporting land waste into the lakes. Such waste as reaches the lakes rests in them, a condition from which results the exceeding clearness of Niagara, or of the St. Lawrence waters that pass the Thousand Islands.

The open Atlantic streams, draining that part of the country which is historically oldest, and being often tidal, have a fame and a commercial value out of all proportion to their size. To begin with the rivers of New England, its conspicuous streams—the Penobscot, Kennebec, Merrimac, Connecticut, and Housatonic—are most of them entered by the tides for many miles. The Merrimac and Connecticut, above tide water, are types of many New England rivers which, being interrupted by rapids resulting from the glacial invasion, furnish a great store of water power.

New York is composite in drainage. The Hudson, with the Mohawk, drains much of its central and eastern lands, but is chiefly impor-

tant for its tidal course of 150 miles, with great harborage at its mouth, and an open gateway to the west from the head of tide water. The Genesee, Black, and other rivers carry to the St. Lawrence much of the run-off of northern and western New York. The Susquehanna, the Delaware, and the Mississippi take nearly all the remainder of New York waters. The Allegheny gathers for the Gulf of Mexico waters that fall within a few miles of Lake Erie.

The Delaware, Susquehanna, and Potomac are all important rivers which rise in the Appalachian plateau and find their way across the various mountain ridges of the Appalachian system by water gaps, and enter the seas through drowned valleys which are characteristic of all the Atlantic streams north of Virginia. In the plateau, where the strata are nearly horizontal, the streams are dendritic, or finger-like, in arrangement. Within the mountain belt the streams are in part longitudinal and in part transverse. By thus running between the ridges and cutting through them in water gaps a rectangular or trellised drainage is formed which is widely found in the Appalachian region. The northern Appalachian waters thus flow mainly to the open Atlantic. In the south, however, or beyond the Potomac, the coastal rivers head in the eastern edge of the mountains, while the Kanawha and the Tennessee, with their branches, head far across the mountains and carry the waters to the Ohio River. The great core of the southern Appalachians in western North Carolina, so convenient it would seem to the sea, is thus drained by a circuitous route into the Gulf of Mexico. The entire belt of Appalachian uplands has for the most part arrived at the stage of mature dissection, with abundant valleys, sunk from 500 to 1500 feet below the prevailing level of the uplands.

Many rivers of local importance rise on the east slope of the Blue Ridge and cross the piedmont plateau and the coastal plain to the sea. Such are the James and other rivers of Virginia, the Roanoke, Cape Fear, Great Pedee, Savannah, and Altamaha of the Carolinas and Georgia. The rivers of Florida are mainly small, but have important tidal courses. The other Gulf drainage is overshadowed in magnitude by the Mississippi. The greater streams aside from this are the Chattahoochee, Alabama, and Tombigbee on the east, and the Colorado (of Texas) and Brazos on the west, and the international Rio Grande, rising in Colorado.

Mississippi River.—See MISSISSIPPI RIVER.

Pacific Drainage.—The Rocky Mountains, especially in Colorado and northward, are the sources of many streams, part of which empty into the Pacific. To the south they send forth the Rio Grande. To the east flows the Arkansas, while to the north and east pass important branches of the Missouri. From the southwest issues the San Juan, while farther north the Grand, White, and Yampa rivers rise in Colorado. All of these join the Colorado River (q.v.) and thus introduce us to the most southerly of rivers in the United States that reach the Pacific Ocean by way of the Gulf of California. Some of the chief facts concerning this river have been given in the description of the topography of the region. Its ultimate sources are in the Wind River Mountains of Wyoming. The only remaining master stream is the Columbia, with its widespread sources in the Rocky Mountains. These largely belong to its tribu-

tary, the Snake River, which after passing the lava plateaus joins the trunk stream in south Washington. The Columbia has an important tidal course before it enters the ocean, and this and the St. Lawrence are the only rivers of the United States which receive great accessions to their waters from foreign territory.

The Hudson may be taken as the type of that great number of streams, especially on the Atlantic side, which have a tidal course. Within the glaciated district most rivers show serious inequalities in their beds, causing innumerable rapids and waterfalls. Such concentration of descent does not occur elsewhere, save in the mountainous belts. The greatness and destructiveness of floods depend upon rainfall, gradient, the porosity of the rocks or soil, and other features. Thus the Ohio has steep slopes, an impervious bed, and a moist climate, when compared with the Missouri taken as a whole. In its long course across the plains the latter loses by seepage, by evaporation, and by abstraction of water for irrigation.

The rivers exhibit great diversity in relation to human uses. The Merrimac and many other streams within the glacial belt are mainly useful for manufacturing or for water supply. The Mississippi is chiefly of value theoretically, but actually its importance is decreasing as a highway, while the Hudson combines transportation, water and ice supply, and the furnishing of power. The Colorado is thus far almost purely scenic in its relation to man, arousing interest by the origin and magnificence of its cañons. The streams of the West are largely used for irrigation. See IRRIGATION.

Climate. The greater part of the area of the United States proper has a climate pertaining to the temperate zone. The average annual temperatures vary from somewhat less than 40° on the northern border to 75° in the extreme southeast. The average temperature for July is about 65° on the north border, and for January it is about 20°. The whole country is exposed to much greater annual oscillations of temperature than occur in Europe. The extreme maximum temperatures are as high as 115° to 120° in the drier portions of Texas and Arizona, and the average minimum falls as low as -60° in northern Montana. The climate of the United States is controlled very largely by its characteristic winds and by its topography. In general the prevailing winds are from the west, coming to the west coast off the Pacific Ocean. To that coast they bring the moisture and uniform temperature of the sea. If the land is cooler than the sea, as in winter, they bring copious rains. If the land is warmer, as in summer, they bring little or no rain, and the moist-air currents pass on eastward to water the Rocky Mountain region. Hence the winter is the rainy season on the Pacific coast and the summer is the rainy season in the Rocky Mountain region.

The majority of the storms originating in the northwest or over the northern Pacific Ocean, travel at first southeastward to the Mississippi valley and then with an east-northeastward course pass over New England or down the St. Lawrence valley. The winds of these cyclones blow spirally inward towards the storm's centre; thus, over the greater part of the country, the winds in advance of such storms are from the east-southeast and south, and draw warm, moist air from the Atlantic and the Gulf of Mexico. After the passage of the storm centre the winds

shift to the west and northwest and are cold, coming from the north interior of the continent. Occasionally more violently whirling storms come up from the West Indies, the tropics, and invade the east United States. These are commonly more intense and severe, but affect smaller areas than those of the westerly winds and resemble closely the typhoons of the Philippines. The absolute annual range of temperature is, of course, greatest in the interior of the country, being about 150° in the upper portion of the Missouri valley and diminishing to 60° in the southern part of Florida and the northwestern part of Oregon. The suddenness with which the air temperature falls is an important consideration. Thus changes of 20° in 24 hours occur far more frequently in the lake region than in the Ohio valley and there again oftener than of the south coast.

The average date of killing frosts in the spring and autumn determines the average length of the growing season for most of the important crops. The autumnal date is September 15 for the region from North Dakota to Lake Huron and October 15 for the region from Colorado to Pennsylvania and northeastward along the New England coast. The latest spring frosts occur on May 20 from Idaho to Lake Superior and February 15 along the South Atlantic and East Gulf coasts. The growing season may be considered as the interval between the last frost of spring and the first of autumn, or it may also be defined as the season within which the average daily temperature does not fall below 40°. From this point of view the growing season diminishes as one goes northward and amounts to about 120 days at the north border of the United States. By a natural process of selection, stimulated by culture, plants that formerly required this length of time for maturity are now pushing northward beyond the borders into Canadian regions where the growing period is as much as 20 days shorter.

One of the most notable features in the climate of the United States is the great contrast between the Atlantic and Pacific coasts. This is due to the fact that the prevailing winds are

The temperatures here given are as read off on charts of isotherms and refer to locations on the land at sea level near the shore. These temperatures are controlled largely by the prevailing winds and the adjacent oceans. A similar great contrast prevails between the temperatures on the east side of Asia and west side of Europe, but in the Southern Hemisphere the corresponding contrasts are not so marked, owing to the presence of the great Southern Ocean and the small area and low altitude of the lands.

Another striking peculiarity in the climate of the United States is the great contrasts of dryness and rainfall. The heaviest precipitation (100 inches and over) and humidity prevail on the coast of Oregon and Washington, due, as noted above, to the prevailing westerly winds and, since nearly all of it comes in the winter, to the fact that the land is then colder than the sea. This winter rainfall diminishes southward, and in southern California it is slight. In the Great Basin and the Rocky Mountain region the rainfall is slight (5 to 20 inches), and the country is in greater or less degree a desert. Yuma in Arizona, Santa Fe in New Mexico, and Pueblo in Colorado have mean relative humidities of 43, 45, and 46 per cent respectively. The amount of evaporation from the soil is correspondingly large in these regions, and artificial irrigation is quite essential for successful agriculture. Even the summits of the mountains of this portion of the continent show but little permanent snow, and that in sheltered spots. What would remain on the ground in an ordinary moist climate is rapidly evaporated in this dry air. Here the scanty rainfall comes mainly in the summer, being, as noted above, derived from the Pacific.

The eastern parts of the country derive their rain from the Gulf of Mexico and the Atlantic Ocean, the former supplying most of the Mississippi valley and the latter the Atlantic plain. The heaviest rainfall in this part of the country is on the north shore of the Gulf of Mexico, where the saturated warm south winds reach the land. Here the annual rainfall exceeds 60 inches. Thence northward up the Mississippi valley the amount diminishes, until about the Great Lakes the precipitation does not exceed 30 to 35 inches. Westward also it becomes lighter, until at the east base of the Rocky Mountains it is in the neighborhood of 15 inches. On the Atlantic coast it is abundant, being supplied from the Atlantic by easterly winds. At Cape Hatteras it is 60 inches, diminishing northward along the coast to 45 inches and diminishing also inland.

Thus the three sources of water supply to the country are the Pacific, which supplies the entire Cordillera region; the Gulf of Mexico, which supplies the Mississippi valley and the region of the Great Lakes; and the Atlantic, which supplies the Atlantic plain. The areas supplied by these three sources are, roughly estimated in percentages of the total area: Pacific, 45 per cent; Gulf of Mexico, 44 per cent; and Atlantic, 11 per cent. The proportions of the total rainfall which are contributed by these three bodies of water are quite different, being roughly as follows: Pacific, 20 per cent; Gulf, 56 per cent; and Atlantic, 15 per cent.

Vegetation and Flora. The eastern and western portions of the United States differ greatly in their vegetation. A small area on mountain summits in northern New England and New York is too cold for trees and has herbs and

from the west and northwest. The land is heated quickly and as quickly cools. The sea is heated slowly, and as the water has circulation it tends to obtain a uniform temperature. Hence the west winds blowing off the Pacific give the west coast a mild and uniform climate. The winds coming from the interior of the continent to the east coast give it a hot climate in summer and a cold climate in winter. The contrast between the mean temperatures on the immediate coast of the United States in January and July are shown in the accompanying table.

low shrubs of arctic aspect. A large part of the eastern United States north of lat. 44°, with isolated patches on the mountains farther south, where the annual snowfall exceeds 50 inches, is characterized by dense forests of spindle-shaped conifers, such as spruce, fir, tamarack, arbor-vite, and jack pine, very similar in aspect to the forests of the colder parts of Europe and Asia, interspersed with many peat bogs or muskegs in depressions and hardwood forests on the richer soils. In these forests there are no broad-leaved evergreen trees, but many evergreen shrubs, largely of the heath family. Berry-bearing plants are abundant, and sedges are more numerous than grasses. All such coniferous forests are subject to fire, once or twice in a long period of years, killing the trees, which are then temporarily replaced by birch, aspen, and other short-lived hardwoods, together with various shrubs and coarse herbs characteristic of such situations, known collectively as fireweeds.

A little farther south, and at lower altitudes on the mountains, usually in better soil, are forests of white pine, hemlock, and numerous hardwoods characteristic of cool-temperate regions.

Most of the country between southern New England and central Mississippi, as far inland as the Alleghany plateau and eastward to the edge of the coastal plain or a little way into it, including the lower slopes of the Appalachian Mountains, has pines and deciduous hardwoods in varying proportions, with a great variety of species in different parts. Something like half the forest in this area is now replaced by fields and pastures. The forests of the Ozark region of Missouri and Arkansas are similar, but with fewer species.

From western New York and central Minnesota to Indiana and Tennessee was originally the great hardwood region of the continent, with over 90 per cent of the trees deciduous. Handsome spring flowers are very noticeable in the forests, which now cover only a small part of the region, the rest, on account of the very fertile soil, being given over to agriculture.

A belt averaging about 100 miles wide from the mouth of the Ohio River to the Gulf is the Mississippi embayment of the coastal plain, mostly alluvial bottoms, originally densely wooded (except near the coast) with cypress, sweet gum, cottonwood, sycamore, elm, pecan, several oaks, and other deciduous trees, with comparatively few shrubs and herbs.

In the sandy coastal plain from Cape Cod to southeast Louisiana, pines of several species constitute the bulk of the forests. These pine barrens are interspersed with numerous swamps, shallow ponds, bays, pocosins, hammocks, scrubs, marshes, and prairies. There are more evergreen hardwoods or broad-leaved evergreens in the coastal plain than in any region previously mentioned. The pine forests have been reduced about one-third by lumbering and farming. Fire sweeps through the grassy undergrowth nearly every winter, but does little damage to the trees.

An area of a few hundred square miles near the coast in extreme eastern and southern Florida, where frost is practically unknown, is characterized by dense tropical jungles of broad-leaved evergreens, of many species, mostly with crooked trunks and fleshy fruits. In such forests fires are rare, but very destructive. A few tropical trees are found also in extreme southern Texas.

A narrow strip of salt marsh and dune vegetation.

tation is nearly continuous along the Atlantic and Gulf coasts from Maine to Texas, except in south Florida, where there are mangrove swamps instead of marshes and almost no dunes.

The great American prairie region extends from west Indiana to North Dakota and Texas. Trees (nearly all of them deciduous) are chiefly confined to the immediate vicinity of streams, and the predominant vegetation is grasses and other coarse herbs, which make a great display of flowers in late summer. Prairie fires were the terror of the early settlers, but are no longer dreaded, for the area is now nearly all in cultivation.

The Great Plains are higher and drier, with more diversified topography and soil and less luxuriant vegetation. The Rocky Mountains (q.v.), extending from Canada to New Mexico, with a little interruption in Wyoming, have considerable areas above timber line. The slopes bear a rather sparse growth of spindle-shaped conifers of several species, varying with altitude, similar in aspect to those of the Northeastern States. Deciduous trees are chiefly confined to banks of streams and recently burned areas. There are many natural meadows and parks, with diversified herbaceous vegetation.

The Colorado plateau, southwest of the Rocky Mountains, is mostly dotted with sagebrush, greasewood, shad scale, and other low hoary shrubs, giving the vegetation a gray tone. But there are vast open forests of yellow pine (*Pinus ponderosa scopulorum*), somewhat resembling the southeastern pine barrens, near its southern edge in Arizona, and scattered junipers and nut pines or piñons (*Pinus edulis*) on rocky slopes.

The hot deserts from western Texas to southeastern California are characterized by scrubby spiny plants with reduced or thickened foliage, such as cacti of many species, yucca, sotol, lecheguilla, ocotillo, palo verde, mesquite, acacia, and creosote bush. In some places, especially at higher altitudes, there is enough grass to support large herds of cattle, but elsewhere grass is scarce. Willows and cottonwoods are common along some of the streams. Some of the mountains in the desert region are high enough to be rather cool and moist and support forests much like those of the Rocky Mountains.

The Great Basin, which covers nearly all of Nevada and parts of the adjoining States, is similar in topography to the hot deserts just described, and equally arid, but cacti and other spiny and fleshy plants are rare, and sagebrush and other gray bushes make up the bulk of the vegetation. Junipers and piñons occur on mountain slopes, as in the Colorado plateau. There are some vast plains of salt and alkali nearly devoid of vegetation, such as the salt desert of western Utah and Death Valley in California.

The arid Columbia plateau and Snake River lava desert are mostly treeless, with sagebrush and greasewood at lower altitudes (below 1500 feet), bunch-grass prairie higher up, a few willows and cottonwoods along streams, and yellow pines on mountain slopes.

The Cascade and Sierra Nevada Range, extending from Washington to southern California, with the heaviest snowfall in the United States, is treeless at higher altitudes, but mostly covered with magnificent coniferous forests, interspersed with meadows or natural parks, somewhat like those of the Rocky Mountains. Northward the forests consist mostly of Douglas spruce, lodgepole pine, western hemlock, various

species of fir, etc., similar in aspect to the north-eastern conifers but larger. Southward and eastward and at lower altitudes and on granitic soils the forests are more open, with yellow pine, sugar pine, and incense cedar the prevailing trees, and fires are more frequent and less destructive, being chiefly ground fires. The noted Big Tree (*Sequoia gigantea*) is confined to a few groves on the west slope of the Sierras in California.

The Coast Range, which borders the Pacific coast of the United States with slight interruptions, naturally has a varied vegetation on account of the great range of annual precipitation, from over 100 inches in west Washington to less than 10 inches in south California. Northward dense coniferous forests similar to those of the Cascade Range prevail. The characteristic tree of this region in California, from the north boundary of the State to about 100 miles south of the Golden Gate, is the redwood (*Sequoia sempervirens*). Several other conifers are endemic to the same region, some of them restricted to only a few square miles. There are more broad-leaved evergreens here than anywhere else in the West, characteristic species being the madrona (*Arbutus menziesii*), California laurel (*Umbellularia*), tanbark oak (*Pasania densiflora*), and California live oak or encina (*Quercus agrifolia*). Southward with increasing aridity the forests give way to chaparral (q.v.), a characteristic vegetation composed of stiff evergreen shrubs, and to grass lands.

For additional details, see the articles on the several States; also ADIRONDACKS, AMERICA, BLACK HILLS, EVERGLADES, GREAT AMERICAN DESERT, OKEENOKEE SWAMP, ROCKY MOUNTAINS, WHITE MOUNTAINS, CHAPARRAL, DESERT, FOREST, HAMMOCK, POCOSIN, PRAIRIE, SWAMP, ETC.

Fauna. The fauna of the United States is an integral part of that of the Nearctic Province (q.v.) and is fully representative of that of North America described in the paragraph *Fauna* under AMERICA. (See also DISTRIBUTION OF ANIMALS; *Fauna* under ROCKY MOUNTAINS.) With the exception of a few strictly boreal species, such as the muskox (q.v.), almost all the genera and species of North American animals of every kind are represented within the boundaries of the United States and its adjacent waters; and most of the Arctic absentees are found in Alaska (q.v.). Reference to the articles cited above and to such articles as BEAR, BEAVER, BISON, DINOSAURIA, EAGLE, EXTINCT ANIMALS, FOSSIL, FUR-BEARING ANIMALS, GROUSE, HORSE, OYSTER, PRONGHORN, PUMA, QUAIL, RATTLESNAKE, SALMON, SKUNK, TURKEY, WHALE, WHITEFISH, and others, will give a conspectus of the fauna of the country.

Geology. North America, like other continents, combines very ancient areas with those that are geologically young. The primitive framework of the continent was drawn somewhat upon the lines of the existing mountain systems of the east and west, forecasting the Appalachian and Cordilleran uplands and the Mississippi lowlands of to-day. The oldest rock systems belong to pre-Cambrian times and are represented to the northward by an irregular V-shaped area inclosing Hudson Bay between its arms and resting its blunted apex upon the north border of the Great Lakes. Extensions of this early nucleus are found along the Appalachians to Alabama, and consist of hard crystalline rocks

of igneous and metamorphic origin, granites, gneisses, schists, marbles, and quartzites being among the common kinds. Such areas are the Adirondacks, some tracts in New England, the Highlands of the lower Hudson and of New Jersey, South Mountain in Pennsylvania, with the Blue Ridge and Unakas of the Southern States. Other primitive masses are found in Wisconsin and Minnesota and form a straggling archipelago in the West, as in the core of the Black Hills, along the axis of the present Rocky Mountain Range, and in the Wasatch and Sierran regions. It must not be thought, however, that the present boundaries of these belts of ancient rock mark the shores of the ancient islands, but the lands now belonging to the United States began thus in narrow strips and patches, east and west.

The next younger but still very old formations belong to the Paleozoic era. This interval of geological time was very long and includes an extended succession of periods, with their subdivisions or epochs. The rocks of the Cambrian, or earliest of these periods, are mainly sandstones, conglomerates, and shales, and are found in limited outcrops about the borders of the earlier crystalline rocks. The Ordovician, Silurian, Devonian, and Carboniferous formations, on the other hand, cover wide areas, especially in the eastern United States. They constitute the bed rocks of a region extending from the Archean axis of the Appalachians, beyond the Mississippi River, reaching into eastern Nebraska, central Kansas, and far into Texas. From the Great Lake region they are found southward to middle Georgia and Alabama, but do not appear along the Mississippi south of the Ohio River. Thus at the close of the Paleozoic era the territory of the United States was a semi-continent on the east, sending lobate areas southward, with the Mississippi embayment between them. There were also rock accumulation and land growth in the Cordilleran region, but it still held a group of islands rather than a continental area. The largest western lands of Paleozoic age are in the region of the Great Basin, but the regions of the Colorado plateaus and of the coastal Pacific States were still sea, the Rocky Mountain belt was a chain of islands, and an unhindered sea swept from the tropical waters to the Arctic.

The Paleozoic era closed, in North America, with what is known as the Appalachian revolution, i.e., with the disturbances which created the great series of folds which now extend from eastern New York to central Alabama. There had long been mountains in the east, as the Adirondacks and Blue Ridge. What their height may have been is not known. During Paleozoic time also the Green and Berkshire ranges of New England were formed. But there were then no mountains west of the Blue Ridge. During all the periods of the Paleozoic era the waste of the older lands on the east and north was swept into an interior sea that ranged from central New York far to the west and southwest. Thus originated the sandstones, shales, and limestones of the Cambrian and succeeding periods, to which reference has been made. Along the old Appalachian border these formations acquired a thickness of several miles. In the mountain building which ensued, these thick beds were crumpled and built into a range of high mountains. These mountains, having wasted away during the long periods which have since elapsed, leave to the

United States the low ranges found now in Pennsylvania, and west of the Blue Ridge in Virginia and more southern States. With the building of the mountains there was a general uplift in the east, which banished the sea waters from the eastern and central States of the Mississippi basin, except in the south.

During the Mesozoic era and the succeeding Tertiary period, the additions to the land areas of the east were confined to the Atlantic border and the Gulf region. From the enlarged lands of the east, following the Appalachian uplift, materials were available for further extensions. In the west the growth was interior as well as on the border, and these later times are marked by the filling in of partially inclosed seas and by retreat of waters, due to massive continental uplift. Thus gradually the western interior sea of the Great Plains region disappeared (as did that of the Colorado basin), and the Pacific shore line was pushed to its present position.

Some of the important episodes of Mesozoic and Tertiary continental evolution may now be noted. The eastern border region has a series of areas of red and brown shale and sandstone, of Triassic age. These formations underlie the lowlands of the Connecticut valley in Massachusetts and Connecticut. Another belt extends from the Palisades of the Hudson into Virginia, and there are other and smaller areas. Associated with these rocks are the lava sheets which form the Orange Mountains of New Jersey, the Palisades of the Hudson, and the Mount Holyoke Range of Massachusetts. The Cretaceous and Tertiary beds of the Atlantic border form southern New Jersey, and the outside lowlands of all the States southward to Florida, and make the coastal plain of this region. They slant gently down and become continuous with the beds that lie below the marginal waters of the Atlantic. Owing to their comparative recency, they are often partially or wholly unconsolidated and occur as sands, gravels, clays, and marls. But they may consist also of well-indurated sandstones and limestones.

Similar statements may be made concerning the formations and the lands that border the Gulf. Here belongs the entire State of Florida, which is low not because of denudation, but because of gentle and limited uplift of the undisturbed and youthful strata which lie beneath its surface. As has been intimated, the ancient Mississippi discharged, not far from the present mouth of the Ohio, into a gulf that thus lay between south-reaching lands on the east and west. Its successive burdens of land waste served gradually to fill the embayment, and its delta reached more and more to the south, encroaching, as it is still, upon the Gulf.

Mesozoic deposits of Triassic, Jurassic, and Cretaceous age are found along the eastern base of the Rocky Mountains, where they are upturned at various angles, as in the vertical or highly inclined strata of the Garden of the Gods. Eastward, at a little remove from the mountains, these beds, which have yielded perhaps the most remarkable series of fossil vertebrate remains that have been obtained in any country, become horizontal and are often covered with still younger stratified formations, which all together make the underlying masses of the Great Plains. The breaking and upturning of the strata seen in the Rocky Mountain foothills points to the main uplift of these mountains which took place at the close of the Mesozoic era.

After the Rocky Mountain revolution, the Great Plains area ceased to be a region of salt-water deposition and was characterized by swamps and great lakes of brackish or fresh water. The Laramie formation belongs to this era of low-lying lands in that region when the sea was excluded, and some of the largest coal deposits of the West were accumulated in the marshes of the time.

Over many thousands of square miles in Colorado, Kansas, Wyoming, and Nebraska are sheets of incoherent or partly consolidated gravels, sands, and clays, which have usually been attributed to sedimentation in such lakes. It is probable, however, that in part, at least, these beds are due to torrents carrying down enormous volumes of waste from the mountains and distributing it in their wanderings over the plains. Present conditions were not approached in this region until the late Tertiary. By that time the entire belt, including the plains and Rocky Mountains, had received a massive uplift, by which the lakes were drained and the plains given an eastward slant, from altitudes of 5000 to 6000 feet at the base of the mountains, to the low prairies west of the Mississippi River.

The rocks of the Colorado plateaus consist of some thousands of feet of sedimentary beds of Mesozoic and younger rocks, overlying a Paleozoic and Pre-Cambrian foundation. The Colorado River has for some distance sunk its channel through the Paleozoic strata and cut far down into the basal granites. Like the Great Plains, this was long a region of marine deposition; here, too, great and widespread uplifts took place, in which the strains were so great as to produce profound fractures and dislocations or faults and attended at times by large outflows of lava. These upflows sometimes stopped below the surface and domed up the overlying strata, making a kind of mountain known as laccolithic, of which the Henry Mountains in Utah are the type.

The initial uplifts of the Sierran mountain belt were made in Mesozoic time, and the strata involved were formed from the waste of the older lands in the present Great Basin region to the eastward. But it was not until late Tertiary time that the entire block or mass of the Sierras was lifted to a great height and tilted to the west. In connection with this uplift a lofty fault scarp developed, which now forms the steep eastern front of the mountains. This crest, therefore, is towards the east, and the principal drainage is down the gentler western slope into the valley of California. The Sierras continue northward as the Cascade Mountains of Oregon and Washington. The Willamette valley in Oregon and the Puget Sound valley in Washington are the analogues of the valley of California, and they are separated from the ocean by a young range of mountains, known as the Coast Range and in parts as the Klamath Mountains and the Olympic Mountains.

Thus it appears that the western United States has had a composite history. It began with island nuclei which grew by sedimentation and uplift. The several great ranges of mountains mark several periods of folding, faulting, and uplift, while both mountains and plains rose by massive and wide-ranging or continental movements, thus adding to the height of the mountains and making the plains into plateaus of from 3000 to 8000 feet in altitude. With these disturbances, especially in Tertiary times, were

the most extensive outflows of lava of which this continent shows any record. These are found either as remnant sheets and volcanic necks, or as vast sheets scarcely changed since their outflow. They occur in nearly every Cordilleran State, as on both sides of the Rocky Mountains in Colorado, in New Mexico, in Utah, in Mount Shasta, and the great cones of the Cascades, and especially in the lava plateaus of the Snake and Columbia rivers in Idaho, Washington, and Oregon. As a lingering episode of their interior volcanic energy we may, perhaps, recognize the geyser phenomena of the Yellowstone Park.

Through all the periods which have been passed in review, the process of land sculpture was active and all varieties of relief have been shown, even in the same area, in successive cycles of denudation and uplift. Thus New England is everywhere mountainous in structure, although much of its surface is now reduced to hills, and to valleys whose bottoms are not far above base level.

The strata of the Mississippi basin have for the most part never been raised to considerable heights, and the streams have not had sufficient vigor to be the instruments of largest denudation. But among the mountains and plateaus of the Cordilleran region the land forms owe their reliefs to long-continued denudation, conditioned by the composition and structure of the rocks.

The principal reliefs were given to the country prior to the glacial invasion. But within the field of glacial movement important changes were effected, and in some cases the combined effect of the wearing of hill and mountain tops and of the filling of valleys was to diminish the total relief by several hundred feet. The territory affected includes all of New England, the Middle States into northern New Jersey and Pennsylvania, and the Central States to lines not far from the Ohio and Missouri rivers. Eastern Nebraska was included, with much of the Dakotas, Montana, and the more northern Cordilleras. Small remnant glaciers are still found in the high Sierras, on the volcanic cones of the Cascades, and in Montana and Colorado. The general effects of the ice sheet were the grinding and transport of rocky waste, coarse and fine, the commingling of this material with the preëxistent soils, the formation of moraines and other bodies of drift during retreat, the blockading of ancient valleys causing innumerable changes of drainage, and the formation of thousands of lakes.

Since the departure of the ice, or during post-glacial time, many of the smaller or more shallow lakes have been filled by sediment, or by deposits of vegetable origin, sometimes forming beds of peat. In the larger lakes deltas and marshy areas have been formed in the same manner. The interrupted streams have resumed their flow along the lowest line of levels that they could find, and in so doing have often cut through the veneer of drift and worn deeply into the underlying rock. This is the origin of most of the gorges of the Northern States. They are young postglacial valleys, and the old, buried channels are often to be found not far away. These conditions have not only produced striking scenic results, in the gorges and waterfalls of the Northern States, but have created nearly all the available water power of the same region. Before the ice invasion many streams flowed at lower levels, in the deep and mature

valleys of the time. But the obstruction of these valleys has compelled the streams to flow at greater altitudes, and the rocky masses and spurs encountered in their downcutting have caused a concentration of descent in rapids or falls and thus have made the streams a source of power, while at the same time obstructing the otherwise open ways of commerce.

Soils. Broadly considered, the soils may be divided into two classes, differing from each other in manner or origin. One class includes the sedentary soils, formed in place, of which the larger proportion have resulted from the decay of the rocks underlying them; their nature depends primarily upon the character of the rocks, whether sandstone, limestone, granite, etc., but is also influenced by the climate and the length of time the soil has been exposed to the weather. Compared with the rocks from which they have been derived the soils of this class contain larger proportions of the more insoluble minerals, like quartz, and less of the soluble ingredients, like calcium carbonate. The soils that have originated in this way occur over a large section outside of the glaciated district. They are the prevalent soils of the South. The second class consists of the transported soils and includes those of glacial, æolian, and alluvial derivation. The glacial soils are found in the northern tier of States that were covered by the Pleistocene ice sheet. Where unmodified they consist largely of heavy clay, but they have often been worked over by water and then are likely to be sandy or loamy in character. Æolian soils are restricted to parts of the Middle West; they consist of exceedingly fine sands with more or less lime and clay as binder and are very deep and fertile. Alluvial soils occur in many of the stream valleys, particularly those subject to periodic inundations, and are best illustrated by the fine silty black soils of the Lower Mississippi basin; they are perhaps the most fertile of all, but for the best results usually have to be drained. See articles on the individual States for further details.

Fisheries. Marine fisheries are practically limited to the submerged coastal plain fringing the continent. The principal fishing grounds of the United States are the Grand Banks of Newfoundland, the Georges Banks off Cape Cod, the Great Bahama Bank off Florida, and the Campeche Bank off Yucatan. The northern waters are remarkable for the enormous quantities of a few species, while the southern are characterized by smaller numbers of individuals, but greater variety of species. Ordinarily the fishing industry concentrates at the nearest point to each of these fishing banks offering a primary market. The total first value is approximately \$75,000,000 annually; capital invested, \$90,000,000; persons employed, 200,000. Boston—next to Grimsby, England, the largest fresh fish market in the world—distributes chiefly herring, haddock, cod, pollock, mackerel, halibut, swordfish, and lobsters. The fisheries were the basis of the early wealth of New England. Approximately 175,000,000 pounds of fish are annually handled; of these 75 per cent comes from the coast of Massachusetts. Savannah and Pensacola are centres of distribution for the southern fisheries (red snapper, bluefish, bass, pompano). Of the Gulf States Florida leads in variety, volume, and value. Here also sponge fishery is important. On the Pacific coast Seattle, San Francisco, and Portland are the great

markets for salmon (value, in 1921, \$29,000,000). The fishery products taken in Puget Sound and landed in Seattle in 1920 aggregated 9,813,966 pounds, valued at \$881,066. This quantity included 7,911,820 pounds of salmon, valued at \$765,145, a considerable decrease from the previous year.

Of the anadromous fish, alewives, shad, and striped bass were originally especially abundant on the Atlantic coast, while the salmon and sturgeon were abundant in both Atlantic and Pacific rivers. Unwise methods of fishing have already resulted in commercial extinction of the salmon on the Atlantic coast, and sturgeon, striped bass, shad, and alewife are decreasing. To a large extent the original beds of oysters and other edible mollusks have been extirpated in the Northern sections nearest the primary markets, but in the Southern waters extensive natural beds still obtain. Artificial propagation produces mollusks of better quality and cheaper. At present more than one-half of the market supply of oysters comes from cultivated areas. The annual mollusk crop ranks first in food and in market values (among the

in 1906 at \$11,446,671, and in 1921 at \$29,041,707. The value of exports, chiefly to Europe and the West Indies, in 1906 was \$6,422,748, and in 1921, \$15,950,501.

For details, see FISH, FISH CULTURE, FISHERIES, FISHING LAWS, SEALING, WHALING, ETC.; on the various species of fishes, COD, MACKEREL, MENHADEN, ETC.; also the various State articles.

Mineral Resources. Prior to the nineteenth century the mining industry in the United States was quite insignificant, but it was not until nearly 1850 that it began to be important. Since that period the industry has developed with a rapidity equal to that of manufactures and transportation. It is significant that the production of the mines constitutes over one-half of the total freight tonnage handled by the railroads. By 1905 the United States had advanced to first rank in the production of most of the useful minerals, and the total value of the combined mineral output was far greater than that of any other country. The growth of the industry since 1880 is seen in the accompanying table.

PRODUCTION AND VALUE OF PRINCIPAL MINERALS FOR 1880 TO 1920

United States fisheries) and exceeds that of all other nations combined. The chief centres of the oyster industry are Baltimore, Norfolk, Providence, New Haven, and New Orleans.

The most important manufactured fisheries products in addition to the food specialties of Gloucester are oil and fish scrap from menhaden, oil from the blackfish and dolphin, glue and fish scrap from the wastes.

The great inland rivers are prolific producers of catfish, buffalo fish, and German carp, which are even shipped to New York and Boston in competition with local fish. Fresh-water mussels are exploited in the manufacture of pearl buttons.

The import trade, largely through New York and Boston, consists chiefly of pickled herring and canned sardines and mackerel from Europe, and fresh haddock, cod, and lobsters from Canada; from Japan canned crab meat and sardines. In 1892 the imports were valued at \$5,457,785,

To the above should be added an unspecified sum amounting in value to \$6,000,000 in 1880, to \$1,000,000 in 1890 and 1900, to \$300,000 in 1910, and \$5,200,000 in 1920. The United States probably has more mineral lands in proportion to its total area than any other country. Nearly every mineral that is used in the arts is mined. These are discussed under their own heads, as COAL, IRON, GOLD, ETC., and in the sections on *Mining* in the articles on the various States. The following paragraphs, however, summarize the production of the more important minerals.

Coal.—Coal is the most widely distributed mineral and is far in advance of any other in the annual value of its output. It is regularly mined in 30 States. The area of the coal fields exceeds 300,000 square miles, of which only a small portion consists of anthracite (q.v.); this is almost wholly confined to the middle-eastern portion of Pennsylvania. Bituminous coal mining began regularly in 1750,

while anthracite mining did not begin until 50 years later. The rapid growth of the industry began after the Civil War and was such that the output of bituminous coal doubled for each decade from 1870 to 1890 and since that time has increased at a rate but little smaller. The output of anthracite increased from 967,108 tons in 1840 to 15,664,275 tons in 1870 and to 89,100,000 tons in 1920. The total production of coal in short tons in 1870 was 33,035,580; in 1880, 71,481,570; in 1890, 157,770,963; in 1900, 269,684,027; in 1910, 501,596,378; in 1920, 556,563,000. The accompanying table shows in short tons the production of coal in the leading States in the years 1870, 1880, 1890, 1900, 1910, and 1920.

STATE	1870	1880	1890	1900	1910	1920
Pennsylvania (anthracite)...	15,650,275	26,249,711	46,468,640	57,367,915	84,485,236	163,000,000
Pennsylvania (bituminous)...	7,798,517	21,290,000	43,302,173	79,842,326	150,521,526	90,050,000
Illinois.....	2,621,163	4,480,000	15,274,727	25,707,981	45,900,246	45,000,000
Ohio.....	2,527,284	7,840,000	13,233,522	18,988,150	34,209,668	45,000,000
West Virginia.....	618,878	1,404,008	6,002,800	22,647,207	61,671,019	87,500,000

Indiana.....	437,870	1,680,000	3,305,737	6,484,086	18,389,815	30,420,000
Kentucky.....	150,582	1,120,000	2,483,144	5,328,904	14,623,319	31,000,000

In 1918 the total coal production in the United States was 678,211,904 tons, the record output for one year. See COAL.

Petroleum.—The production of petroleum began in western Pennsylvania in 1859. The United States soon became the chief source of the world's supply and, except for a few years when Russia surpassed it, has held the primacy. The principal producing States and their production in barrels in 1920 were: California, 105,668,000; Oklahoma, 105,725,000; Illinois, 10,772,000; Texas, 96,000,000; Louisiana, 35,649,000; West Virginia, 8,173,000; Pennsylvania, 7,454,400; Ohio, 7,412,000; Wyoming, 17,071,000; Kansas, 38,501,000. See PETROLEUM.

Iron.—Iron making ranks in importance next to coal, iron ore, like coal, being very widely distributed in the United States, 26 States reporting its production in 1920. The mining of iron began in early Colonial days, but it did not rise into importance until near the middle

ing range, Mesaba, the ore is sometimes found so near the surface that with the removal of a few feet of earth it is mined by the open-pit method, the ore being scooped by huge steam shovels directly from the pit to the car. Probably in no other mines in the world does massive machinery play so great a part in mining operations and hand labor so little. See IRON; IRON AND STEEL, METALLURGY OF.

Gold.—The mining of gold on an extensive scale did not begin until the discovery of the placer gold in California in 1848. Between 1820 and 1830 some interest had developed in the States of Virginia and North and South Carolina, and for a number of years the output averaged about \$1,000,000. In 1850, within two

years after the California discoveries, the output was \$50,000,000, and it did not fall below this figure until 1860. The product greatly exceeded in total value all other minerals mined during that period. As ordinary placer mining became unprofitable, quartz mining and hydraulic mining were resorted to, and California continued to be an important gold-mining State. The production of gold in 1921 was 2,375,479 fine ounces, valued at \$49,105,500. See GOLD.

Silver.—The development of silver mining in the United States was almost as sudden as was that of gold. The production of this metal had been quite insignificant until the discovery of the Comstock Lode (q.v.) in western Nevada in 1859. The United States then became the leading silver-mining country of the world. The only other nation that now competes with it in this industry is Mexico. The output of the Comstock Lode declined rapidly after 1877. Nevertheless other mines were developing, and

PRODUCTION OF IRON ORE IN LONG TONS

STATE	1850	1891	1901	1910	1920
Minnesota.....	645,105	11,109,537	31,966,769	40,274,000
Michigan.....	2,700	6,127,001	9,654,067	13,303,906	18,715,000
Alabama.....	1,838	1,986,830	2,801,732	4,801,275	5,769,000
Pennsylvania.....	877,283	1,272,028	1,040,684	739,799	675,000
Virginia.....	67,319	605,116	925,394	903,377	296,000
New York.....	46,385	1,017,216	420,218	1,287,209	978,000
Wisconsin.....	1,149,551	1,067,000

of the nineteenth century. Of the total output in 1918 the hematite variety amounted to 65,894,709 long tons (maximum output, 70,743,513 long tons in 1917). The Lake Superior ore is almost wholly red hematite, which represents about nine-tenths of the ore mined in the United States. The development of the Lake Superior iron region is one of the most significant of recent industrial movements in the United States. It has been rendered possible largely through the advantage afforded by the Great Lakes for transportation. In the principal min-

ing range, Mesaba, the ore is sometimes found so near the surface that with the removal of a few feet of earth it is mined by the open-pit method, the ore being scooped by huge steam shovels directly from the pit to the car. Probably in no other mines in the world does massive machinery play so great a part in mining operations and hand labor so little. See IRON; IRON AND STEEL, METALLURGY OF.

Copper.—Very little copper was mined prior to the development of the Lake Superior copper mines, which began operations in 1845. From that year, when the production was 224,000

pounds, the product has continued to increase steadily and rapidly. In 1866 the famous Calumet and Hecla mine was opened. In 1917 the smelter output had grown to 1,886,120,721 pounds. In 1920 it amounted to 1,209,061,040 pounds. The chief producing States are Arizona, Montana, Michigan, Utah, Nevada, New Mexico, and Tennessee. The smelter production of Alaska in 1920 was 66,093,924 pounds, as compared with a production of 56,534,992 pounds in 1919. In 1918 Arizona produced 769,521,721 pounds. See COPPER.

Lead.—The United States ranks first among the countries of the world in the production of lead. The mining of this mineral began as early as 1720 in the southwestern part of what is now Missouri, but it was not until a century later that operations assumed much importance. For a number of years the mining of lead was, after iron, the most important metal-mining industry in the United States. Lead was mined in Utah in 1858. About 1877 work began on the Leadville mines, Colorado. The Leadville ores are argentiferous, and the silver obtained in the early days of mining was of greater value than the lead itself. A little later argentiferous lead mines were developed in Idaho (Cœur d'Alene) and other Cordilleran States. See LEAD.

Stone.—Stone suitable for building and other industrial purposes is abundant in almost every State. Because of its bulk and the consequent shipping expenses, its production is largely limited to a comparatively local market. Hence in many of the States which have the most valuable resources of stone the quarrying industry has scarcely more than begun. The utilization of stone varies with the economic condition of the country, the total value having fallen from \$53,035,020 in 1889 to \$31,346,171 in 1896, and advanced steadily to \$120,500,000 in 1920. See BUILDING STONE.

AGRICULTURE

The United States produces a larger value of agricultural products than any other country. In 1919 the total value of crops and animal products was about \$17,000,000,000. Until the last quarter of the nineteenth century agriculture strongly predominated in the industrial life of the nation. It still employs a much greater number of individuals than any other industry. Owing to the vast area and great variety of physical and climatic conditions, most of the staple products known to the world can be raised. To the Mississippi valley, which stands preëminent for agricultural purposes, are being added vast areas of the West and Northwest which are being rapidly brought under cultivation. If to the arable portion of the Mississippi drainage basin be added the area drained

into the Gulf of Mexico by other streams, it would include about one-third of the country's total area. In this division, almost unbroken by mountain or swamp, the soil is generally fertile.

The Appalachian and Atlantic seaboard region contains much broken and rocky land, and soil of only moderate or of inferior quality. Throughout the eastern half of the United States the rainfall is ordinarily sufficient for growth of crops. Westward, however, in the longitude of central Kansas, the rainfall is greatly diminished and irrigation, dry farming, and grazing are followed. The Gulf of Mexico has a decidedly moderating effect on the climate of the Gulf States, particularly Florida. But there is no protection in this region against the cold winds from the north which occasionally sweep southward and bring frosts even to that State. Although much farther south than south Europe, the Gulf region is less adapted to the growing of subtropical products. The Appalachian Mountains and the Atlantic Ocean together have a somewhat moderating effect upon the Carolina-Virginia region and the region farther north; hence this area has an advantage in the raising of some products, especially fruit. In the north the lakes have a moderating influence, making some sections of that territory also favorable for fruit growing. On the Pacific coast the ocean currents and the mountains together afford the most highly protected portion of the United States and make it well adapted as a fruit region.

Area of Farms and Improved Land. In the following table it will be seen that the total farm area of the United States increased from 1860 to 1920 nearly 500,000,000 acres.

ACRES OF LAND IN FARMS

CENSUS YEAR	Total	Improved
1860.....	407,212,538	183,110,720
1870.....	407,735,041	188,921,099
1880.....	536,081,835	284,771,042
1890.....	623,218,619	357,616,755
1900.....	811,201,546	414,793,191
1910.....	878,798,325	478,451,750
1920.....	955,883,715	503,073,007

The largest absolute increase in the acreage of farm land between 1910 and 1920 occurred in the West North Central division, which at both censuses comprised a larger area than any other division. The highest rate of increase was in the Mountain division, 50 per cent. More than five-sixths of the improved farm land of the United States in 1920 was in the two North Central and the two South Central divisions. The following table shows the acreage of improved land and the total land area in 1920.

DIVISION	Total land area (acres)	Total land in farms (acres)	Improved land in farms (acres)
United States.....	1,903,289,600	955,883,715	503,073,007
New England.....	39,664,640	16,990,642	6,114,601
Middle Atlantic.....	64,000,000	40,572,901	26,562,107
East North Central.....	157,160,960	117,735,179	87,894,835
West North Central.....	326,914,560	256,973,229	171,394,439
South Atlantic.....	172,205,440	97,775,243	48,509,886
East South Central.....	114,885,760	78,897,463	44,380,132
West South Central.....	275,037,440	173,440,127	64,189,606
Mountain.....	549,840,000	117,387,226	30,105,868
Pacific.....	203,580,800	56,152,705	23,921,533

The most noteworthy fact shown is the great importance, absolutely and proportionately, of the North Central divisions. Nearly three-fourths of the total farm area in this section is improved. There are but few large regions in the world so easily and uniformly adaptable

The percentage of rented farms and the rate of increase of these are greatest in the South. The greater proportionate number of rented farms in that section results from the industrial change incident to the overthrow of slavery, many negroes becoming renters, although an

AVERAGE NUMBER OF ACRES PER FARM BY GEOGRAPHIC DIVISIONS

GEOGRAPHIC DIVISION	1920	1910	1900	1890	1880	1870	1860
The United States.....	148.2	138.1	146.2	136.5	133.7	153.3	199.2
North Atlantic.....	101.9	112.9	96.5	95.3	97.7	104.3	108.1
South Atlantic.....	84.4	93.3	108.4	133.6	157.4	241.1	352.8
North Central.....	17.1	105.1	144.5	133.4	121.9	123.7	139.7
South Central.....	124.5	236.2	155.4	144.0	150.6	194.4	321.4
Western.....	360.2	296.9	386.1	324.1	312.9	336.4	366.9

to cultivation. In Iowa over 95 per cent of the total land area was in farms in 1920, and of this over 25 per cent was improved. Illinois makes almost an equally good showing, and Indiana, Ohio, North Dakota, Missouri, and Minnesota are other States in this group which have a large percentage of improved land.

Size of Farms. From the table above it will be seen that the size of farms varies greatly in different parts of the country.

The most fundamental principle in determining the size of the American farm is the character of the land and the type of farming. The average size of farms is smaller in the older sections of the country than in the newer and is smaller in the South where leased to tenants than in the North. The recent settlement of the West, in which the average homestead (160 acres) was adapted to the average family, has tended to establish this unit. In the South, where the plantation system formerly prevailed, a rapid breaking up is taking place to suit the family unit. The size of farm that a family can cultivate varies with the type of farming. Thus the same labor that will suffice for a grain or stock farm of a given size is sufficient for only one-half or less of that amount when a cotton farm is in question.

Farm Tenure. As the country becomes older there is a rapidly increasing and almost universal tendency towards the renting system, though this is much more marked in some regions than in others. In the earlier period of development the man of small means took a claim, but now he is forced to rent. The frontier, as it pushed across the country, has been characterized by the fact that most of its farms were operated by owners. In the table below it will be seen that the highest percentage of owned farms is in the West, but the renting of farms began at once and steadily increased.

YEAR	Total farms	NUMBER OF FARMS OPERATED BY		
		Owners	Cash tenants	Share tenants
1920.....	6,448,343	3,025,090	480,009	1,117,721
1910.....	6,361,502	3,948,722	712,294	1,528,389
1900.....	5,739,657	3,713,371	752,920	1,273,366
1890.....	4,564,641	3,269,728	454,659	840,254

There is an increased tendency to delegate the management of farms. In the South and North Central States especially a large number of the owners are absentees. The table in the next column shows the number of owned and rented farms and the tenancy in each class.

increasing number are acquiring land. (See NEGRO IN AMERICA.) Rented farms average less in size than the owned farms, and a larger percentage of the rented farms is improved. This is particularly true in the South and is most noticeable in share-rent farms. Farms in that section are leased mainly for raising crops.

Farms in the United States are usually rented for short periods, one year at a time being the most common. In Great Britain, by contrast, the long-term system of tenure prevails.

Methods. See AGRICULTURE.

Irrigation. Within the territory now comprising the arid region of the United States irrigation has been practiced to a limited extent from prehistoric times. When the Spanish explorers entered the territory now forming the States of New Mexico and Arizona, they came across the remains of ancient aqueducts and found the natives watering their crops. The Spaniards who settled in this territory continued and extended this practice, as the country was uninhabitable without it. The area irrigated was very limited, however, being confined principally to the pueblos of the Indians and the missions of the Roman Catholic fathers, until about the middle of the nineteenth century, when American settlers began to go into the West from the East and North. The beginning of irrigation in the United States by Americans is usually attributed to Brigham Young and the Mormon pioneers who settled in the Salt Lake valley in 1847. The fact is that in many parts of the West irrigation was necessary for obtaining subsistence, and wherever permanent settlements were made the settlers began applying water to the soil for the production of crops. The settlement of the Mormons in Utah and the discovery of gold in California occurred at about the same time, and both the Mormon farmers and the California miners were compelled to use irrigation in order to subsist.

In 1870 the first colony of any considerable size depending on irrigated agriculture, aside from the Mormon colony, was founded at Greeley, Colo., under the patronage of Horace Greeley. The first period of active construction of irrigation works on a large scale occurred in the late eighties and early nineties, when many large enterprises were undertaken by promoters who hoped to profit by the great increase in land values created by irrigation. Few of these undertakings were successful financially. This boom in irrigation construction was followed by a long period of depression, lasting until 1902 or 1903, during which little construction took place. In 1902 Congress enacted the Reclamation Law, providing for the construction of irrigation works by the Federal government with the proceeds from the sale of public lands, and at about the same time construction by private enterprises was renewed.

The first statistics of irrigated lands in the United States were collected in connection with the census of 1890, and they have since been compiled for each census period of ten years, including 1920. These figures show the great development of irrigated lands.

The census of irrigation, as taken both in 1920 and in 1910, covered the States of North Dakota, South Dakota, Nebraska, and Kansas in the West North Central division, and all of the West South Central, Mountain, and Pacific divisions. In that part of the United States east of the territory covered, small areas of truck and fruit crops are irrigated at times, but they were not included in the canvass.

The total area reported as irrigated in 1919 was 19,191,716 acres, an increase of 4,758,431 acres, or 33 per cent, over the area irrigated in 1909. The total area to which existing enterprises were capable of supplying water in 1920 was 26,020,477 acres, an excess of 6,828,761 acres over the area irrigated in 1919. These figures indicate the extent to which existing irrigation works were utilized in 1919, about 74 per cent of the effective capacity being used.

In 1910 existing irrigation works were capable of irrigating 20,285,403 acres, an excess of 5,852,118 acres over the area irrigated, indicating that in 1910 about 71 per cent of the effective capacity was utilized. The absolute excess of capacity over utilization, however, was greater in 1920 than in 1910.

The area of land in irrigation enterprises reported as available for settlement in 1920 was 2,257,981 acres.

The total capital invested in irrigation enterprises to January 1, 1920, was \$697,657,328, an average of \$26.81 per acre, based on the area to which the enterprises were capable of supplying water in 1920. The capital invested to July 1, 1910, was \$321,454,008, and the average per acre was \$15.85, based on the area enterprises were capable of irrigating in 1910. The increase from 1910 to 1920 in the total capital invested was 117 per cent, and in the average investment per acre, 69.1 per cent.

The total value of crops reported as grown on irrigated land in 1919 was \$801,005,326, an average of \$76.41 per acre for the acreage of crops reported.

The irrigated land of the United States is supplied with water principally from streams, 94 per cent of the acreage irrigated in 1909 being supplied from this source, 3.3 per cent being supplied from wells, 1.4 per cent from springs, and the remainder from reservoirs and lakes. The normal summer flow of most of the streams of the arid region is utilized. Irrigation works have been constructed by individuals, coöperative companies, commercial enterprises, irrigation districts, and the Federal government. The coöperative companies are usually joint-stock companies; irrigation districts are organized under State laws authorizing the issuing of bonds, to obtain funds to meet the cost of works and the levy and collection of taxes on the lands composing the districts to pay the bonds, interest, and operating expenses. The Carey Act is a Federal law granting lands to the States containing arid lands on condition that the States provide for reclamation by irrigation; and the Reclamation Law provides for the construction of irrigation works by the Federal government with the proceeds of the sale of public lands and for the repayment of the cost of such works by the users of the water supplied by the works.

Crops. The table on page 708 shows value of all farm crops by divisions and States in 1909 and 1919, as returned by the Bureau of the Census. The most important crops are corn, hay, wheat, and oats.

Corn.—The largest and most valuable American crops are corn and hay. They are at the basis of the great stock-raising interests of the country. Corn stands without a rival either in respect to area or value. It is indigenous to America, and the United States produces about four-fifths of the world's supply. The production of corn in 1921 was about 3,081,251,000 bushels, valued at \$1,305,624,000. See MAIZE.

Hay.—As compared with corn, hay is of greater relative importance in regions which are not well adapted for the growing of corn, but where the demand for stock food is nevertheless great. Thus in the North Atlantic States the acreage of hay is twice the total area devoted to cereals, and in the western division of States the acreage of hay is over 16 times

VALUE OF ALL FARM CROPS BY DIVISIONS AND STATES—1919 AND 1909
(Not including forest products or nursery and greenhouse products.)

1 The 1919 figures include the value of corn cut for forage, which crop was not reported to any extent in 1909. The value of corn cut for forage in the United States in 1919 was \$200,934,660, or 8.2 per cent of the total value of hay and forage.

that of corn and nearly 30 per cent greater than that of all cereals combined. In the latter region a large part of the crop has the advantage of irrigation. In most of the North Central States hay is the second crop in respect to acreage and value. In the cotton States less attention is given it, although there has been a significant increase in this section in recent years. The increase in the acreage of hay has been especially rapid since 1880, the area devoted to it having doubled since that time. The principal variety of hay is timothy, its production being confined largely to the North Central and the North Atlantic States. The production of hay in 1921 was about 96,802,000 tons valued at \$1,090,776,000. Next in importance are wild, salt, and prairie grasses, which are produced in regions in which timothy is little grown—the salt and other marshes, and the more arid prairie region and westward. Alfalfa stands closely in acreage to timothy. Its production is largest in the North Central and the Western States. Two or more cuttings of this crop are obtained annually, and it stands first in yield per acre. Clover grown alone ranks next to alfalfa in acreage, but a larger area is devoted to clover and timothy as a mixed hay crop. In the Far West, especially California, large quantities of grain are cut green for hay. Millet and other hay and forage crops are grown in most parts of the country.

Wheat.—The United States wheat crop varies in amount from one-third to one-half that of Europe. Wheat can be successfully grown in every State of the Union. However, the competition of certain favored regions has limited its cultivation in others. A hardy crop and of quick growth, it is the principal crop in the North and the West. The climate and soil are less favorable to its growth in the South. The extensive wheat farms of former years have been gradually broken up and mixed farming has taken their place. During the period from 1870 to 1890 wheat cultivation developed in Argentina, India, and other regions, and these countries came into competition with the United States in the European market. This fact, coupled with the high production of the United States, caused a decrease in the price of wheat over the greater part of the country. In the regions where the winters are rigorous, especially where the snowfall is not heavy enough to protect vegetation or where the rainfall may be inadequate in the autumn, the wheat crop is sown in the Spring. In 1921 a little less than one half of the total wheat acreage was winter wheat. Wheat benefited even more than corn from the improved machinery which came into use about 1850 and subsequently. This, together with the improvement of transportation and the adaptability of the prairie soils to wheat culture, resulted in a rapid increase in the acreage devoted to the crop. The total production of wheat in 1921 was 794,893,000 bushels, valued at \$737,068,000.

Cotton.—Nearly 65 per cent of the world's supply of cotton is produced in the United States, where it is one of the leading crops. The area devoted to cotton and the production have been greatly extended in the past half century. According to the United States Bureau of the Census the acreage of cotton harvested by recent census years was: 1879, 14,480,019; 1889, 20,175,270; 1899, 24,275,101; 1901, 32,044,000; and 1919, 33,740,106. The production of cotton

lint for the same dates, by running bales, was 5,575,359, 7,472,511, 9,393,242, 10,072,731, and 11,376,130 respectively. The production of cotton in 1921 was 8,340,000 bales, and the amount reported ginned on Jan. 1, 1922 was 7,884,272 bales. Linters to the amount of 439,637 bales were produced in 1921, and the total amount of the cottonseed, which was crushed for its oil, hulls and cake, was \$4,060,604 tons. The principal area of cotton production is the region between the Appalachian Mountains and the sea, beginning with the southern tier of counties in Virginia and including more than two-thirds of North Carolina, practically all of South Carolina, Georgia, Alabama, Mississippi, Arkansas, and Oklahoma, most of Texas, and all of Louisiana except the sugar and rice parishes. Most of the cotton area is devoted to the growing of upland types of cotton (*Gossypium hirsutum* and various hybrids), but the finest and most expensive cotton is the Sea Island (*Gossypium barbadense*), which is grown in the coast region of South Carolina, southeastern Georgia, and northern Florida. Locally produced strains of Egyptian cotton are grown in Arizona, and a very superior upland cotton in California.

The cotton-boll weevil menace, which grew to serious proportions in the last decade of the nineteenth century, has been a disturbing factor in cotton production. First appearing in Texas, it gradually spread until it reached nearly to the northern limit of cotton production in Oklahoma and eastward until in 1922 it covered nearly all the cotton area of North Carolina. The presence of the boll weevil has probably done more to revolutionize methods of production and to diversify agriculture in the infested regions than any other agency.

Oats.—The only other crop which is grown on a scale comparable with the foregoing crops is oats. The acreage of oats is indeed greater than that of cotton, but the value is much less. In New York, Wisconsin, and some other Commonwealths oats has the largest area of all cereals. In a number of other States it ranks second, including the two largest oats-growing States, Illinois and Iowa, in each of which it is much more extensively grown than wheat. The United States produces less than one-third the oats of the world. The production in 1921 was 1,060,739,000 bushels, valued at \$321,540,000.

Rice.—Although rice was introduced as early as 1700, and has been grown ever since, it was not until near the year 1900 that its cultivation began to assume large proportions. South Carolina ranked first in its production until 1880. A new epoch in rice cultivation began in 1897-98, when it was successfully grown by the aid of irrigation in the coastal prairie lands of southwest Louisiana. The cultivation of rice in that region developed with remarkable rapidity, and the production of the country increased from 21,838,580 bushels in 1909 to 39,653,000 bushels in 1921. Of this last amount, which was only a little short of the consumption of the country, Louisiana, Texas, Arkansas, and California together produced by far the largest amount.

Other Cereals.—Other varieties of cereals than those mentioned flourish, but have not become favorites as in some other countries. The United States produces only one-tenth of the barley crop of the world and prior to the World War was exceeded by European Russia. It is an important crop in California, where it is used as

a stock-food substitute for corn. The other States in which it is most grown are Minnesota, Wisconsin, Iowa, and the Dakotas. The production of rye is greatest in Wisconsin, Pennsylvania and other northern States. Pennsylvania and New York produce over five-eighths of the buckwheat of the country. Kafir corn and other nonsaccharine sorghums are adapted to the semiarid regions and are grown chiefly in western Kansas, Oklahoma, and Texas.

Vegetables.—Vegetables are grown commercially on three classes of farms: intensively cultivated gardens adjoining the large centres of population and devoted to the more perishable; general farms which include the staple fall and winter vegetables in their planting scheme; and truck farms located in mild regions along the South Atlantic and Gulf coasts as well as in southern California, where large quantities of perishable vegetables can be grown in greenhouses. The reported acreage of vegetables, not including potatoes and sweet potatoes, increased from 2,162,130 acres in the census year 1899 to 2,763,269 in 1909 but decreased in 1919 to 1,475,000. The South Atlantic States lead in both acreage and value, having planted 337,379 acres in vegetables in 1919. Of the individual States, the leading ones, judged by area of vegetables planted, were New York with 132,000 acres, Ohio with 60,860 acres, Pennsylvania with 54,283 acres, Illinois with 60,705 acres, Virginia with 47,307 acres, Kentucky with 16,124 acres, and Maryland with 119,922 acres.

Potatoes.—The most extensively grown and most valuable of the vegetables are potatoes, yet the production is small as compared with that of Europe. About 78 per cent of both acreage and production was in the Northern States. Among the individual States New York led in production in 1919 with 32,470,847 bushels, followed by Wisconsin with 26,376,021 bushels, Maine with 25,531,470 bushels, and Michigan with 23,929,560 bushels.

Sweet Potatoes.—More than nine-tenths of the sweet potato crop is grown in the South. The total acreage in 1919 was 803,727 as compared with 641,255 in 1909. The total production was 78,091,913 bushels, compared with 59,232,079 in 1909. New Jersey, the most important sweet-potato State in the North, planted 15,427 acres. The Southern States grew sweet potatoes in large quantities, especially Georgia, Virginia, North Carolina, South Carolina and Florida. California had 7632 acres, or more than nine-tenths of the acreage for the entire West.

Fruits.—The most remarkable development of all phases of American agriculture in the three decades, 1890–1920, was made in fruit culture. This industry nearly doubled in magnitude in that period. The number of orchard trees, e.g., increased from 193,452,598 to 226,153,971 (not including subtropical varieties). Most varieties of temperate-zone fruits are grown in every State. The use of refrigerator cars has made it possible to transport fruits long distances, and thus all parts of the country have the advantage of the general market. However, climatic differences tend to localize. From the

accompanying table it will be seen that the apple has a decided primacy among American fruits.

Formerly the apple received most attention in the Northeastern and North Central group of States, but its commercial culture has rapidly extended southward to northern Georgia and west to the plains region and to the northwestern States. New York, on account of its old orchards, is still the largest-producing State. The total production of apples in 1921 was 96,881,000 bushels. The peach crop amounted to 32,733,000, the pear crop to 10,705,000 bushels and the orange crop to 30,700,000 bushels. Peaches are grown generally throughout the country, but the greatest development has been in the production of early peaches in the South and in California, where the rapid development of the dried-fruit industry has further stimulated the production of all orchard fruits. In fresh deciduous fruits California shipped in 1921 over 40,000 carloads, the largest shipment being of grapes, 28,000 carloads. In dried fruits California shipped 277,660 tons, a decrease from 330,370 tons in 1920. The Pacific coast, particularly California, leads in the production of plums, prunes, apricots, and grapes. The total number of grapevines of bearing age in the United States in 1920 was 225,754,285, of which California had nearly two-thirds. The raisin industry is confined to California. Besides California, the chief region for the production of table grapes is the Lake Erie region in northern Ohio and western New York. Cherries and pears are grown throughout the country.

The production of the three most important varieties of small fruits—strawberries, raspberries, and blackberries—is well extended over the country. Cranberries require boggy lands and are principally limited to the Cape Cod region, southern New Jersey, and central Wisconsin. Massachusetts produces over 60 per cent of the product. California is unsurpassed as a region for the growing of all kinds of subtropical fruits, as the remarkable development of that region during the period 1880–1920 fully demonstrates. This region is also the chief centre of production of almonds and English walnuts. South Florida is also a large centre of orange culture and is the only important centre of pineapple culture of continental United States. (See CALIFORNIA; FLORIDA.) Arizona and New Mexico also give promise of becoming important centres for the growth of subtropical plants. The total acreage in small fruits in 1920 was 249,084, and the production was 324,988,968 quarts. Strawberries aggregated 119,395 acres, with 176,931,550 quarts, raspberries and loganberries amounted to 66,333,509 quarts, blackberries and dewberries 39,945,078 quarts.

Tobacco.—Virginia maintained the primacy in tobacco production until 1850, when it was surpassed by Kentucky. The latter State has steadily increased, until it represents over twice the acreage and value represented by the former. The total production in 1921 was 1,117,682,000 pounds, compared with 1,582,225,000 in 1920. The other principal States producing tobacco are Ohio, Tennessee, South Carolina, Wisconsin, Pennsylvania, Maryland, and Connecticut.

Sugar and Sugar-Producing Crops.—The raising of sugar cane in the United States proper is largely confined to Louisiana. The area devoted to sugar cane in the United States in 1919 aggregated 372,938 acres. The production of cane sugar in 1921 amounted to over

ORCHARD FRUITS, TREES OF BEARING AGE IN 1920

Peaches and nectarines.....	65,646,101
Pears.....	44,647,412
Plums and prunes.....	20,452,293

1,121,000 tons. Sorghum cane is grown very generally throughout the United States. The total acreage in 1919 was 482,043, and the sirup produced amounted to 21,523,025 gallons. In the early history of the country a large part of the sugar and sirup consumed was manufactured from the sap of the maple tree. The maple sugar made in 1919 amounted to 9,691,854 pounds. About two-thirds of this was made in Vermont and New York. The maple-sirup product in the same year amounted to 3,507,745 gallons, Ohio being the leading State in sirup production. Since 1890 there has been a rapid development of the beet-sugar industry. The production of beet sugar increased from 2203 tons in 1889-90 to 900,000 tons in 1921. The latter amount was produced from 636,000 acres of beets. Over two-thirds of this acreage was in Colorado, California, and Michigan, and the remainder was distributed through a number of States. Unlike sugar cane, the sugar beet is usually grown as an incidental to other farming operations. Owing to their high value per acre, they are both, however, important to the sections in which they are grown.

Stock Raising. Compared with crop growing, stock raising is of much more importance in the United States than in European countries. The per capita number of horses, cattle, and hogs is much greater in the United States than in any of the principal European countries. The total value of all live stock on farms in the United States in 1910 was \$4,925,174,000. Of the total, the value of domestic animals, \$4,760,060,000, represented 96.6 per cent and the value of poultry most of the remainder. The accompanying table shows the number of live stock on farms and ranges in 1900, 1910, and 1920.

world. Vermont early became well known for the raising of driving horses, but the blue-grass region of Kentucky contains a large number of the most famous breeding farms of driving horses in America. (See HORSE.) From the trotting stock are bred roadsters and coach horses, the European breed of coach horse not being extensively bred in the country. The United States has not developed any new breeds of draft horses, but imports stock horses of this kind from Europe. The favorite breeds are the Percheron, Shire, and Clydesdale. The steady growth in the demand for horses prior to about 1890 resulted in the breeding of the low-grade as well as the better class. In recent years the premium paid for high-grade horses has checked the breeding of inferior animals, and since 1890 the grade of horses has improved much faster than before.

Cattle.—The nineteenth century was well advanced before stock cattle from Europe had been imported to any considerable extent. Short-horns were for several years imported in the largest numbers, and there are more shorthorns in the United States to-day than of any other breed. The hustling qualities of the Herefords made them favorites in the range States. The Aberdeen-Angus were introduced later (1870), but have become rivals of the Herefords for beef purposes, especially in the North Central States. These are the three principal breeds used in the United States for breeding and for grading up native cattle for beef purposes. In feeding and breeding beef cattle it has been the aim to reduce the time necessary to prepare the animal for market and the tendency has been to produce earlier maturing animals. In the North Central division cattle are being finished for market at from

1900.....	39,144,046	2,533,579	1,706,199	10,055,721	3,328,848	22,228,620

Little was done prior to the beginning of the nineteenth century to improve the breeds. By the year 1900 the rate of improvement had become very rapid, and at the present has been extended to all classes of live stock in practically all sections of the country.

Horses.—The most distinctive success attained in American horse raising has been in the development of a new and superior breed of race horses. American racers are the best in the

12 to 18 months and known as baby beeves.

The method of cattle raising in the range region has greatly changed since about 1900. Formerly cattle were pastured and driven about without hindrance over government lands. To-day much of the range area is inclosed by wire fences. Part of the former range area has been settled by small farmers, but produces more cattle than under the old system. Instead of letting range cattle shift for themselves in

winter, as formerly, it is common to provide food and protection for them.

The recent remarkable development in the dairying industry has exercised a decided influence over cattle raising. The number of milk or dairy cows increased from 6,385,000 in 1850 to 31,364,459 in 1920, while the increase in dairy value of these cattle was proportionately much greater. See CATTLE; DAIRYING.

Swine.—The United States has accomplished more in the development of new and superior breeds of hogs than in that of any other farm animal. Indeed, in both the quality of the breed and in absolute number the United States stands almost alone in this branch of industry.

Until towards 1850 the most common grade was the half-wild, long-legged, thin animals known as razor-backs. They are still common in the Southern States, but before 1830 a distinct breed, the Chester White, had been developed in Chester Co., Pa., and about 1840 another new breed, the Poland China, originated in southwestern Ohio. The Duroc-Jersey, another native breed, first became common in New Jersey, and is now well known over the country. Through these and other improved native breeds, together with the imported Berkshires, the grade of hogs in the North Central States has been improved until it has reached a very high standard. Stockmen have aimed at securing a breed that will fatten quickly and at an early age. The Poland China does this, and its imprint is most noticeable among American hogs.

Sheep.—Sheep hold a much lower rank in the agricultural economy of the United States than in that of most modern nations. The industry has labored under the disadvantages of a vacillating tariff policy. During the middle of the nineteenth century the merino was the prevailing breed, but in 1900 it was estimated that 30 per cent of the flocks in the range country were of mutton breeds, and that from 70 to 80 per cent of those in the farming States had a predominance of English blood. The merino blood still predominates in the range States. The number of sheep in the United States in 1910, outside of the Western division of States, was not so great as in 1850. Sheep raising began to spread rapidly in the Western division about 1870. Since 1890 there has been remarkable development in that region. The foremost sheep-raising States of the Western division are Wyoming, Montana, New Mexico, and Idaho. In New England the dairy industry has supplanted sheep raising, so that the number of sheep in 1910 was less than one-third the number in 1850. Since 1880 there has been a decline in the North Central States, particularly Ohio. Texas in 1890 had attained first rank, but in 1920 had less than one-third the number of sheep reported for the earlier year.

Poultry.—The importance of the production of eggs and poultry in the United States is not generally realized. The value of the poultry and the egg products in 1920 was \$373,395,057 respectively, an increase of 115.6 per cent. The different kinds of fowls in 1920 numbered as follows: chickens, 359,537,127; turkeys, 3,627,028; geese, 2,930,203; ducks, 2,817,624. The total value of live stock products in 1919 was \$2,667,072,273, compared with \$1,177,974,703 in 1909. The value of dairy products was \$1,481,462,097, of eggs and chickens \$1,047,323,170, of wool and mohair \$124,006,859, and of honey and wax \$14,280,153.

Forests and Forest Products. See FORESTRY; LUMBER INDUSTRY.

MANUFACTURES

The United States is the foremost manufacturing country in the world. Manufacturing in the United States is of coördinate importance with, if not of greater importance than, either of the two other leading American industries, agriculture and trade and transportation. A statistical summary from the thirteenth census for the more important American manufacturing industries will be found under MANUFACTURES (q.v.). In the export of manufactures the United States in 1919 led all countries with a record of \$4,063,354,637, as compared with about \$1,500,000,000 for Great Britain. Germany's resources have been so crippled by the war that her foreign commerce has been practically destroyed. Her trade with the United States is therefore seriously reduced. Previous to the European War Germany also exceeded the United States in its export of manufactured goods, the total amount averaging slightly in excess of \$1,500,000,000. With the revival of business it is estimated that new records in exports will be made.

The following are the general statistics of manufactures in 1919, as obtained by the 1919 census.

Number of establishments.....	290,105
Capital.....	\$44,688,093,771
Wage earners.....	9,096,372
Wages.....	\$10,531,600,340
Value of materials.....	\$37,376,380,283
Value of products.....	\$62,418,078,773

In a preliminary analysis of the 1919 census returns for manufactures an increase in products amounting in value to some \$41,000,000,000 was indicated, as compared with \$24,000,000,000 reported for 1910, and \$11,500,000,000 in the 1899 census. These figures may be compared with the total returns of the census of production of Great Britain for 1907, viz., some \$8,000,000,000, estimates of \$17,500,000 in 1922, and the approximate figures of between \$11,000,000,000 and \$12,000,000,000 for 1913 in Germany, and an estimated output from France running about the same as that of Great Britain, before the war.

Natural Advantages. The abundance of raw material required by the manufacturing industries, the degree of availability, including transportation facilities, and the capabilities of the producers are unequaled. Both food supplies and agricultural materials for manufacture are cheaper, more abundant, and more varied in the United States than in any other manufacturing country. The well-distributed forests contain most varieties of timber needed in large quantities and in amounts that admit of heavy exportation. In the production of the two minerals which constitute the basis of modern manufactures, coal and iron, the United States ranks foremost and indeed produces more than a third of the world's output of each. Moreover, the deposits of these minerals, together with deposits of limestone, which is needed in fluxing the iron ore, frequently have been found in the same or a neighboring locality.

The transportation facilities include 26,410 miles of navigable streams and a railway mileage (264,000 miles in 1922) that is greater than that of all Europe and is 36.5 per cent of the railroad mileage of the world. The competition

of the waterways with the railways has had its effect in giving to the country the advantage of cheap rates. Another advantage about which little is said, but which nevertheless is great, is the freedom of interstate commerce, with a Federal Interstate Commission to prevent unfair discrimination and generally to regulate transportation. In no other equally large area in the civilized world is trade unrestricted by customs, excises, or national prejudice. The freedom which the United States enjoys from tradition is another factor of prime importance.

At the same time the manufacturing industry has profited by reason of the contribution of ideas of people schooled under different industrial systems. The immigrant, like the native born, is animated by the prospects of large possibilities, and greater energy and ingenuity pervade industrial society in the United States than are known in the European countries. As a result the individual laborer usually accomplishes more in the United States than he does in Europe.

Mulhall, the statistician, once said that nearly all American manufactures were produced by machinery, while in Europe more than one-half were hand work. This statement as regards Europe hardly would hold true to-day, but in many industries as regard the completeness of organization, the minuteness of subdivision, and the rapidity with which work is expedited, the United States excels. This is particularly the case with the newer industries, such as electrical machinery and motor vehicles. The United States early developed a system of interchangeable mechanism, followed later by various schemes of industrial efficiency, which have proved of inestimable value to the progress of the manufacturing industry.

Localization. The manufacturing industry is very unevenly distributed over the country. There is a decided tendency to centralize in limited localities. The greater part of the manufacturing is carried on in the region north of the Potomac and Ohio rivers and east of the Mississippi. The centre of manufactures has always been well to the north and east of the centre of population, but has at every decade moved westward and was nearer the centre of population in 1922 than in 1850.

There has been an increasing tendency in recent years toward a concentration of industries in the Eastern and East North Central States which may be in part accounted for by the concentration of population in the larger cities; the necessity for keeping transportation charges low; and the better credit facilities available to manufacturers.

In the localization of industries the factor of transportation in its relation to the supply of raw materials and the market has been one of primary importance. This applies especially to bulky and heavy products which are shipped with difficulty. Thus Pennsylvania, eastern Ohio, and Illinois have become the iron-manufacturing region, since coal and iron are brought together here at a minimum cost. Live animals cannot be so easily shipped as packed meats, and hence the slaughtering and meat-packing industry is confined mainly to the West. The saving in the cost of transportation is a chief reason for the development of cotton manufacturing in the cotton-growing region. Proximity to the supply of wood and iron and convenience to the market give the Lake States the ad-

vantage of manufacturing agricultural implements at a minimum transportation cost, though in 1922 New York ranked second to Illinois in this field, while Ohio was third. The densely populated Atlantic Coast region from Baltimore to Maine enables manufactures located in that section to reach a large market, including convenient export ports, with a minimum transportation cost.

Another important natural condition affecting localization of industries is water power. This was formerly an important consideration and was more prominent in determining the exact spot than the general section. Often, however, the natural advantages mentioned were of secondary importance, and this consideration declined in relative importance after an industry was well established.

Latterly, with hydroelectric developments, location adjacent to a cheap and reliable source of water power again has become an important consideration, though by means of long-distance transmission lines electrical energy can be delivered at convenient locations within a certain radius. Electrochemical industries in particular have been located with this consideration in view, and it has been estimated that there are some 50,000,000 horse power available for water power in the United States. Much of this water power has been governed in its use by Federal restrictions and reservations, but will be developed with more liberal legislation.

In many industries technical training and labor supply are of greater importance than accessibility to raw materials, and efficient organization and scientific control are being developed by the more important manufacturing corporations. Abundance of capital and labor are other prominent advantages that may vary with economic conditions, but are usually available for the American manufacturer. For the growth and extent of manufactures, see MANUFACTURES, and the separate articles on the various manufacturing industries, such as COTTON; FLOUR; IRON AND STEEL, METALLURGY OF; ETC. Also see the paragraph on *Manufactures* under the various States.

Textiles. The group of industries called textiles in 1919 ranked first in the number of wage earners employed and third in the value of products. The following table shows for 1919 the product of each of the chief elements of textile manufacture.

Cotton.....	\$2,125,272,193
Woolen Goods.....	364,896,590
Silk.....	688,469,523
Knit Goods.....	713,139,689
Cordage and twine.....	183,366,476
Shoddy.....	23,254,398
Dyeing and finishing textiles.....	323,967,683

The cotton-manufacturing industry has developed in recent years with great rapidity and has placed the United States first with respect to the number of bales of cotton consumed.

In 1921 the number of cotton spindles in the United States was estimated at 36,843,000, out of a total for the world of about 150,000,000. The wool consumption for 1920 in the United States was 724,633,201 pounds, of which 297,155,000 pounds were domestic and 427,578,038 were foreign. In 1921 the amount of foreign wool imported had reached nearly 320,665,751 pounds.

The value of the products of woolen and worsted goods in 1919 was 1,065,434,072. In that year there were 166,787 wage earners employed in 852 establishments. The manufac-

ture of worsteds dates back to 1843. The textile and woolen industries are expanding at a rapid rate, owing to increased demands, to improved processes of manufacturing, and to the high artistic qualities of the goods made. The hosiery and knit-goods industry is also of comparatively recent development. From a product valued at \$1,028,102 in 1850 it grew until it amounted to \$713,139,689 in 1919. In that year the United States led in the value of silk manufactured, which amounted to \$688,469,523. Almost the entire supply is imported from Japan, China, and Italy. The industries of cordage, twine, jute, and linen manufacture had products valued at \$182,025,000 in 1909. There were 28,144 wage earners employed in 188 establishments. Binder twine (value, in 1921, \$27,000,000) and rope (value, in 1921, \$39,000,000) together constitute over one-half of the total product. See FLAX; JUTE; KNITTING; SILK; TEXTILE MANUFACTURING; WOOL AND WORSTED MANUFACTURES.

Clothing. The production of men's ready-made or factory-made clothing was already well advanced by 1850, but the manufacture of women's ready-made clothing has developed almost wholly since then. The total value of men's clothing (factory product) in 1919 was \$1,162,985,633, an increase of 24 per cent since 1909, when it amounted to \$485,677,493. In 1889 it was \$251,019,609; in 1879 it was \$209,548,460; in 1869, \$61,865,547; and in 1859 \$80,830,555. The value of women's factory-made clothing meanwhile increased from \$159,339,539, in 1899, to \$1,208,543,128, in 1919, or a great increase. In 1889 the output of this industry was valued at \$68,164,019, in 1879 at \$32,004,794, in 1869 at \$12,900,583, and in 1859 at \$7,181,039. There are few other important branches of industry that employ so many wage earners in proportion to the value of the product. In 1919 there

to New York; while Illinois, Pennsylvania, and Maryland follow in the order named. Other important items of clothing manufacture for the year 1919 were: shirts, \$205,327,133; men's furnishing goods, \$107,834,695; hats and caps, other than straw and fur felt, \$44,539,861.

Iron and Steel. The United States is abundantly provided by nature with resources that are necessary for the production of iron and its manufacture. (See IRON.) No other industry compares with it in the absolute growth made since 1880. In 1890 the United States led the world in the production of pig iron and steel, and in 1905 its production of pig iron was more than double that of Great Britain and its production of steel was more than three times as great as that of the rival country. In 1920 the United States produced 36,925,987 long tons of pig iron. The production of pig iron by grades in the years 1915, 1919, and 1920 is given in the accompanying table.

PRODUCTION OF PIG IRON BY GRADES
1915-20, gross tons

GRADES	1915	1919	1920
Basic.....	13,093,214	14,404,131	16,737,722
Bessemer.....	10,523,306	9,075,934	12,062,084
Foundry.....	4,864,348	4,916,758	5,957,782
Malleable.....	829,921	1,009,049	1,310,951
Forge.....	316,214	271,286	318,048
All other.....	289,210	347,206	539,500
Total.....	29,916,213	31,015,364	36,925,987

In 1920 the steel output of the United States exceeded 50,000,000. In 1921 the United States was attaining close to a production of 58,000,000 tons per annum.

The following are statistics for blast furnaces from the time of their being reported first in 1849 to the fourteenth census in 1919.

YEAR	Number of establishments	Wage earners Average number	Wages	Cost of material	Value of product	Value added by manufacture
1919.....	2,905	175,270	\$197,821,990	\$603,031,493	\$1,162,985,633	\$560,000,000
1899.....	223	39,241	18,484,400	131,503,655	206,756,557	75,252,902
1889.....	304	33,415	14,614,458	110,098,615	145,643,153	35,544,538
1879.....	341	41,605	12,655,428	58,610,742	90,315,569	30,605,827
1869.....	386	27,554	12,475,250	45,408,017	69,640,498	24,142,481
1859.....	286	15,327	4,545,430	12,253,050	20,870,120	8,577,090
1849.....	404	21,054	5,011,300	7,538,118	13,491,898	5,953,780

were 175,270 engaged in the manufacture of men's clothing and 165,649 in that of women's clothing. After about 1876 a revolution in the system of manufacturing men's clothing, resulting from the greater division of labor and the use of machinery, brought about a decrease of nearly one-fourth in the number of wage earners, but this was made good after 1900 by the natural increase in the industry.

In 1919, out of 5,258 establishments devoted to the manufacture of men's clothing, 600, with a product valued at \$108,072,822, were contract shops, as compared with 4,658 regular factories, with a product valued at \$1,162,985,633. More skill is required in the manufacture of women's clothing, and the task system has not been applied much in cloak manufacture. In 1909 almost one-half of the total product of men's ready-made clothing and over two-thirds of women's ready-made clothing were made in New York City. The business formerly done in Massachusetts has been largely transferred

The production of Bessemer and low phosphorous pig iron reached a maximum of 13,840,518 long tons in 1906, falling to 12,062,084 in 1920, while that produced by the basic open-hearth method amounted to 16,737,722 tons. The value of steel rails manufactured increased from \$37,892,075 in 1880 to \$60,272,575 in 1890, and to \$100,000,000 in 1920, the tonnage in that year being 2,604,116. Immediately following the war, there was a large demand for iron and steel products. Early in 1921 this demand had been met and there was a decline in the value of the ore mined and a decrease in the products of the steel manufactures. However, in anticipation of increased demands in the immediate future, extensive improvements have been made both at the mines and in the manufacturing mills to meet calls for increased capacities. Several important factories have been built for the manufacture of tinplates, structural steel, and other forms. There are a number of others projected for construction in 1923. These will

all be well equipped, modern works, designed to turn out materials of the highest quality.

The leading steel corporations have lately taken steps through affiliated companies to become interested in the large industries which consume a large part of the domestic production of iron and steel. They have been particularly attracted to the automobile and farm tractor industries. See IRON AND STEEL.

Shipbuilding. Shipbuilding was, after agriculture, the first industry to develop in Colonial America. The possession of an abundance of timber has always given the United States a great advantage in the building of wooden vessels. Vessels constructed in the United States carried the bulk of the American trade until after 1860. After the Civil War for many years American shipyards did little more than supply vessels for the large domestic water-borne trade,

which has by law been restricted to vessels built in the United States, but changes in conditions due to the European War led to increased activity in 1915 when ship manufacturers were well supplied with orders and looked for continued prosperity. The figures for the construction of iron and steel vessels have been greatly swollen in recent years in meeting the requirements of the Navy Department. While ships for the navy have been and are built at the large navy yards, the greater part of the orders for warships have been placed with domestic firms, in the belief that it would lead to the equipment of plants in a way that would enable them successfully to engage in the construction of large steel merchant vessels. Much of the total tonnage built in the United States is constructed on the Great Lakes. Shipbuilding suffered severely from the world-wide depression in trade in 1921. The American industries were particularly hard hit and very few orders for new construction were placed with them. The United States Shipping Board, which

was interested in several of the largest American yards, disposed of its interests in 1921. It was, in 1922, the largest owner of shipping tonnage, and as that tonnage comprised some of the finest vessels afloat, it was estimated that there will be little activity in American shipyards until existing tonnage is used up.

Automobiles. In 1900 the manufacture of these vehicles was conducted in 57 establishments, employing 2241 people, with a production of \$4,748,000. In 1919 there were 315 establishments, employing over 210,000 workmen, with a product valued at \$2,387,903,287. In 1921 the exports of automobiles manufactured in the United States exceeded \$81,922,357. The manufacture of motor vehicles has become very important, and, in addition to the normal demand for home consumption with its regular increase, there were manufactured for the belligerent armies during the European War a vast number of motor trucks and other motor vehicles. The industry in 1921-22 enjoyed prosperity. (See MOTOR VEHICLE.) Registration of cars and trucks in all the States showed large increases over previous years. The total registration of passenger cars and trucks at the beginning of 1922 exceeded 10,000,000. Notwithstanding the great prosperity of the industry, prices were reduced so that the average wholesale price of a motor car at the beginning of 1922 was \$700 as compared with \$897 at the beginning of 1920. The average wholesale price of a motor truck in 1922 was \$950 as compared with \$1280 in 1921.

Alcoholic and Malt Liquors. The production of liquors in the United States has been greatly changed by the adoption of the principle of prohibition. In 1919 the value of malt liquors produced was reported at \$379,905,085, distilled liquors at \$31,854,085, and vinous liquors at \$17,454,194. The manufacture of wine is relatively small and is confined to the grape-growing regions. The total number of establishments producing liquors of all kinds in 1919 was 1105, and the total workers employed, 34,773. See LIQUORS.

Slaughtering and Meat Packing. In 1850 slaughtering and meat packing was of little importance as a specialized industry, the value of the product for that year being only \$11,981,642. Before 1890, however, the industry had become the most important of the industries manufacturing food products, and in 1919 was far in the lead with a total value of products of \$4,246,290,614. There was a proportional increase of the capital invested, which amounted to \$1,176,483,643.

The number of wage earners employed in the industry in 1919 totaled 163,600. There were 1004 establishments reported in 1919. About 40 per cent were engaged primarily in slaughtering and packing, and these employed 90.7 per cent of the total number of wage earners, and their output was valued at \$3,736,500,000, or 87.9 per cent of the total for the industry. See PACKING INDUSTRY.

In addition to the above see CARRIAGE; BICYCLE; MOTOR CYCLE; IMPLEMENTS, AGRICULTURAL; PAPER; LUMBER INDUSTRY; GLASS; LEATHER; SHOES; ETC.

TRANSPORTATION

Railways. The great industrial progress that began soon after 1850 was made possible largely by railways. The construction of railways in the United States began towards the close of

the decade 1820-30. Their introduction had been preceded by the inauguration of a vast system of canals, the Erie Canal, which was to remain long the principal artery of transportation between the East and West, having been opened in 1825. The growth of the railway system was extremely rapid from the beginning. The mileage increased from 23 in 1830 to 2818 in 1840 and 9021 in 1850. Over much of the country railways preceded industries, and certain industrial developments, such as those of iron and coal and of agriculture in the West, could not have taken place on any great scale without railway advantages. The growth of American railways, in which it is estimated from one-seventh to one-fifth of the country's capital is now invested, is shown in the following table (mileage).

DISTRICT	1850	1860	1870	1880	1890	1900	1910	1919
Eastern.....	6,888	19,596	29,772	46,233	47,210	43,506	56,310	64,028
Southern.....	2,133	9,190	11,587	15,409	27,067	34,566	44,003	52,571
Western.....	1,840	11,503	31,500	88,719	106,275	140,126	145,155
Total United States.....	9,021	30,626	52,922	93,262	163,597	193,346	240,438	263,707

The figures previous to 1890 have been taken from Poor's Manual, but have been combined to approximate the groupings of the Interstate Commerce Commission as given in their annual report of 1919. The divisions correspond to the three great freight classification territories and are as follows: the Eastern District, comprising that portion bounded on the west by the north and west shore of Lake Michigan to Chicago, thence by a broken line whose corners are Peoria and East St. Louis, and down the Mississippi to the mouth of the Ohio River; on the south by the Ohio River to Parkersburg, W. Va., thence by a line to the southwest corner of Maryland and down the Potomac to its mouth. The Southern District is bounded on the north by the Eastern District and on the west by the Mississippi; the remainder of the country exclusive of the noncontiguous territory comprises the Western District.

The rate of growth has fluctuated greatly. Checked by the Civil War, the mileage nearly doubled between 1865 and 1873. From the latter year to 1879 construction was reduced, but it then revived and, with a short interruption in 1884-85, advanced rapidly until 1893 and again continued after 1898. The year 1887 exceeded all others, with 12,876 miles. Prior to 1850 construction was mainly in the Atlantic Coast States, but in 1850-60 noteworthy gains were made in the North Central States and in the South. In 1852 rail connection was established between Chicago and the Atlantic coast and in 1869 between the Atlantic and Pacific coasts. In 1870-80 there were important gains in the upper Mississippi valley and in eastern Texas, which was the first southern State to show activity in railway construction after the war. In 1880-90 the Southern States doubled their mileage. Since 1895 (in which year there was the least construction after the Civil War, 1650 miles) the most rapid progress has been between the Gulf of Mexico and the Kansas and Missouri rivers. The greatest railway density is in the region north of the Ohio and Potomac rivers. New Jersey leads with 30 miles of line for each 100 square miles of area.

Among the factors that hastened railway development were the business rivalry between cities or sections, subsidies in one form or another, and the small cost of right of way. State grants in aid (many of them land grants) were common until 1861, when the Federal government began to make land grants directly to the companies. The first line reaching the Pacific received grants of 33,000,000 acres in addition to a large loan based upon mileage and difficulty of construction. The total congressional land grants between 1850 and 1871 amounted to 155,000,000 acres, but of these only 97,976,637 acres were patented up to 1902.

In general American railways have been constructed more cheaply than British or western European, but improvements have been made as warranted by traffic. Thus there is great in-

equality in the condition of American roads.

The tendency towards railway consolidation appeared soon after 1850. Keen competition did not come until after the Civil War, notably in 1869, when the Pennsylvania Railroad and the New York Central made their connections with Chicago. The development of the parallel lines, or two or more railways connecting the same points, so intensified competition that the companies were forced to seek among themselves some relief. Thus arose, between 1870 and 1880, the pools, or agreements between companies in regard to the distribution of traffic or the benefits of trade. The prohibition of pools by the Interstate Commerce Act of 1887 renewed competition, to escape which the railway companies came to secret understandings, and traffic associations were formed to fix a fair proportion of the traffic for each railroad involved. In 1897 this form of coöperation was declared illegal by the United States Supreme Court. Thereafter agreements between companies as to rates and the distribution of traffic benefits were more informal, but, according to the Interstate Commerce Commission, the court decisions have had "no practical effect upon the railway operations of the country," while, in respect to the organization of railways, the inconveniences in the way of mutual understandings accelerated consolidation, notably after 1898. Thus in 1902 more than two-thirds of the total mileage of the United States was included in eight groups of railway interests.

Systems.—There were 263,301 miles of railway in the United States, or an average of 25.64 miles of railway to each 10,000 inhabitants in 1919. The history of the building of these railways covers a period beginning in 1826. As in other countries, the railway system of the United States may be compared to a net, but the main routes for freight and passengers can be briefly summarized as follows: (1) the lines radiating from New York and connecting that city with Boston and the rest of New England on the north, Chicago on the west, and the South Atlantic seaports on the south; (2) the roads running from the various Missouri River

crossings to the Mississippi River crossings; (3) the roads running north and south from Chicago, serving the Mississippi valley; (4) the transcontinental railroads, so called, running from the Mississippi River crossings to the Pacific coast.

The main routes, connecting New York and Chicago, are the New York Central Railroad, which runs north from New York, following the Hudson River to Albany, where it turns west, following the Mohawk valley, and then the shores of Lake Erie to Buffalo, and from there continuing west to the south end of Lake Michigan; the Pennsylvania Railroad, which runs 90 miles south from New York to Philadelphia, there turns west crossing the Alleghenies to Pittsburgh, running from there slightly north of west to Chicago; and the Erie Railroad, which runs about west from New York to Chicago, but which is a little longer than either of the other two routes because of the number of curves necessitated by the mountainous character of the country traversed.

Chicago is the greatest railway centre in the country. It is the western terminus of the three great eastern roads which run out of New York, the northern terminus of the Illinois Central, which runs down the Mississippi valley to New Orleans, the southeastern terminus of the systems reaching the great northwestern wheat and grain country. These roads include the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, and the Chicago, Burlington, and Quincy. It is the eastern terminus of the Atchison, Topeka, and Santa Fe, the Chicago, Rock Island, and Pacific, and through it passes the traffic which the Chicago and Northwestern Railway delivers to the Union Pacific at Omaha, Neb.

The twin cities of Minneapolis and St. Paul are the railway centre of the northwestern roads, which include, besides the Chicago, Milwaukee, and St. Paul previously mentioned, the Northern Pacific and the Great Northern. South of Chicago the two great railway centres are St. Louis, at the juncture of the Mississippi and the Missouri rivers, and Kansas City, on the Missouri River. Kansas City is the northern gateway for the roads which spread out over the States of Kansas, Oklahoma, and Texas, and which include the Chicago, Rock Island, and Pacific, the Missouri, Kansas, and Texas, and the Kansas City Southern. Still farther south New Orleans is the southernmost Mississippi crossing; the southern terminus of the Illinois Central; the southeastern terminus of the Southern Railway system, which spreads like a net over the Southeastern States; and the eastern terminus of the Southern Pacific, which skirts along the southern boundary of the United States from the Mississippi River to the Pacific Ocean.

Notwithstanding the fact that all these cities except Kansas City are situated on important waterways, their railroad facilities have had the greater influence in their commercial development. The cities west of the Mississippi, as far as California, have been entirely dependent on the railroads, and the development of California has been shaped to a far greater extent by north and south railway lines in that State than by the coastwise steamship lines.

The following is a brief description of the principal railway systems of the United States, with their affiliated and subsidiary lines:

The Pennsylvania Railroad system runs from

Philadelphia via Pittsburgh to Chicago, and from Pittsburgh to St. Louis, and from Philadelphia north to New York, and from Philadelphia south to Washington. Nearly half of the total tonnage of freight of that part of the system lying between Philadelphia and Pittsburgh is coal, and a considerable percentage of the remainder is products of the steel mills at Pittsburgh. Financing for the road has been done principally by Kuhn, Loeb & Co.

The New York Central lines run from New York via Albany to Buffalo and Chicago, and from Cleveland to Cincinnati and St. Louis, with a line from Buffalo to Pittsburgh. A considerably smaller proportion of its freight tonnage consists of coal, and a much larger proportion of merchandise and manufactured products.

The Southern Railway runs south from Washington and spreads like a net over the Southeastern States.

The New York, New Haven, and Hartford forms a network over the New England States as far north as Boston and is supplemented north of Boston by the Boston and Maine, which it at one time controlled.

The Great Northern runs from St. Paul along the northern border of the United States to Spokane, Portland, and Seattle; lumber and agricultural products of California form its east-bound freight traffic, moving over the entire line. It also has a very large business furnished by grain in the Northwestern States, and a large tonnage of ore moving from the Mesabe Range to Duluth, Mich.

The Northern Pacific runs from St. Paul through the Dakotas and Montana to Portland and to the cities of northern California.

The Chicago, Milwaukee, and St. Paul runs from Chicago via Minneapolis and St. Paul, through the Dakotas and Montana to Portland and Seattle; the Rockefellers have a controlling interest in the company, and its financing has been done by various banking houses.

The Chicago, Burlington, and Quincy runs from Chicago west to Denver and northwest to Billings, Mont., where it connects with the Northern Pacific; it has also a line running south from Denver to Houston, Tex.

The Union Pacific runs west from Omaha to Salt Lake City, where it connects with the Southern Pacific, which extends west to San Francisco and northwest from Denver into northern California, Oregon, and Washington.

The Atchison, Topeka, and Santa Fe runs from Chicago west to Denver and southwest through Arizona to California; it has lines running the length of California north and south. No one interest controls the Atchison, Topeka, and Santa Fe.

The Southern Pacific runs from New Orleans through Texas to Los Angeles and up the Pacific coast to Washington, and from Salt Lake City to San Francisco; the system was built up by Collis P. Huntington and was sold to the Union Pacific in 1901. In 1913 the United States Supreme Court ordered the sale of the controlling interest in the Southern Pacific stock by the Union Pacific.

The Chicago, Rock Island, and Pacific runs from Chicago southwest through Kansas and Oklahoma into Texas, west from Chicago to Denver, and north from Chicago into Wisconsin and Minnesota.

The Illinois Central runs from Chicago south to New Orleans.

The Wabash, the Missouri Pacific, the Denver and Rio Grande, and the Western Pacific form a system running from Buffalo, N. Y., to San Francisco, Cal.

President Wilson took over control of the United States railroads on Friday, December 28, 1917, by proclamation, and he appointed William G. McAdoo, Director General of railroads. The government was forced to take over control of the United States railroad systems for military purposes and because they had ceased to function efficiently. Numerous reforms were introduced under this unified management, many of which are permanently retained. Private management was restored on March 1, 1920. At this time there were numerous labor troubles, the roads were short of capital and their credit was impaired, while there was great transportation activity. Both rates and wages were advanced, the government loaned money to the roads urgently needing it under a new law known as the Transportation Act of 1920. All records were broken for volume of freight traffic moved in 1920, despite shortness of equipment.

Large claims were made against the government for final settlements of accounts arising during the period of Federal control. In many cases the government made counter claims for improvements made.

Competitive conditions necessitated the discontinuance of many of the changes and innovations introduced during the unified control by the Railroad Administration. There have been many varied opinions expressed with regard to the effects of government control. All, however, are agreed that under the existing conditions it was a necessity and that it proved its effectiveness in certain directions was shown by the roads continuing its new practices when they resumed control of their systems.

Consolidated ticket offices and joint railroad and shippers' committees on rates have been quite generally continued by the roads. The pooling of cars is abandoned and also joint freight and passenger stations; but the unification of terminals has been retained in part. Many of the routine improvements introduced by the government experts have been found equally sound under conditions of private operation, and are proving very beneficial to the companies.

The railroad brotherhoods endeavored to sustain the high rates of wages paid during the war period after the railroads resumed control of their systems. Numerous controversies arose between the representatives of the various unions, the railroads, and the Interstate Commerce Commission regarding working hours and wages. There were numerous strikes during the years 1919-22. See CANAL; EXPRESS COMPANY; INTERSTATE COMMERCE ACT; POST OFFICE; RAILWAYS; STEAM NAVIGATION; STREET RAILWAYS; TELEGRAPH; TELEPHONE; TRANSPORTATION.

COMMERCE

Foreign Commerce. Early Development.—The foreign commerce of the United States has passed through those various stages which usually accompany the transition of a country where manufacturing succeeds agriculture as the predominating industry. The section of the United States first developed was densely forested and had also certain mineral deposits available. This was the section lying east of the Alleghany and Cumberland mountains. When the section west

of those mountains was developed, it was found especially fitted for the production of live stock, wheat, corn, and other cereals; at the south cotton, and at the extreme north copper and iron. With the extension of railways to the west of the Mississippi the grain and live-stock area gradually enlarged, the mineral products were materially increased, and the population able to contribute to foreign commerce rapidly developed, partly by immigration from abroad and partly by movement from the Atlantic seaboard. With the occupancy of the Pacific coast the large production of gold increased the power to purchase imports and developed industries which contributed to the export trade, while the wheat and fruits of that section found ready markets abroad. Meantime the development of great coal beds in the eastern and central sections of the country had, in conjunction with the domestic cotton, wool, iron, and copper, developed a great manufacturing industry, which was strengthened by labor supplied by the heavy immigration from the European countries. These industries supplying the exports in turn demanded the products of other countries—some of them for the consumption of the people engaged in production, some of them for use in manufacturing.

Thus every stage of the development of the country contributed to commerce, and this development extended to every line of production, forestry, agriculture, mining, and manufactures. The outside world came to recognize the United States as a source of supply for lumber, cotton, copper, wheat, corn, meats, and finally manufactures; and the United States came to recognize certain sections of the outside world as the source which could supply the foodstuffs and manufacturing materials required by its busy and prosperous population.

The growth in commerce has therefore been steady and consistent with the development of producing and consuming powers of a great fertile country enlarged from time to time by great additions of territory and an increase to its population of over 30,000,000 immigrants. True there have been certain occasions in which the growth in exports was temporarily disturbed, having been checked by the embargo which accompanied the war with Great Britain in 1812-14 and again stimulated by a large importation of merchandise for reexportation during the period of the Napoleonic wars, but they were but mere incidents produced by temporary causes and disappeared with their termination.

The commerce of the Colonies prior to the Declaration of Independence was largely with Great Britain. This was quite natural, both in view of the fact that the people were of British birth or parentage and thus accustomed to the

COMMERCE OF THE THIRTEEN COLONIES IN 1769

	Imports from	Exports to
Great Britain.....	£1,604,973	£1,531,516
West Indies.....	789,754	747,910
Africa.....	151,998	20,278
South of Europe.....	76,684	552,736
	£2,623,412	£2,852,441

products of that country and that England systematically encouraged, by legislation and otherwise, a reliance upon the mother country for every class of merchandise which it could supply.

Gradually, however, there grew up the custom of drawing upon other countries of Europe, especially for wines and fruits and for coffee, tea, spices, and silks, which they had drawn from the Orient, while sugar, molasses, and rum were obtained from the West Indies.

The foreign commerce of the 13 Colonies in 1769 is stated by Macpherson, *Annals of Commerce*, in the table on page 718 which, not complete, closely approximates the total trade in that year.

It is not until 1821, however, that we get a clear view of the real trade condition of the United States. Prior to that time, by reason of the war complications abroad, much foreign merchandise from the West Indies and elsewhere was sent to the United States for reexportation, much of this merchandise merely passing from one vessel to another. The further fact that the official statement of imports and exports prior to 1821 did not state the values of the various articles forming the trade in sufficient detail

FOREIGN COMMERCE OF THE UNITED STATES AT DECENNIAL YEARS 1790-1920

FISCAL YEARS	IMPORTS				EXPORTS			
	Free	Dutiable	Total	Per capita	Domestic	Foreign	Total	Per capita
1790	\$20,000,000	\$6.51	\$26,481,000	\$8.66

* Figures for this year are abnormal because of the European War.

Then followed the War of the Revolution, in which commerce with England was practically suspended and that with other countries greatly interrupted. Owing to the loose commercial organization of the Colonies during this period and immediately after the war no satisfactory record of the commerce is available. The total value of the merchandise exported from the United States in the first year under the Constitution, from August, 1789, to September, 1790, is \$20,205,156, of which about \$9,000,000 was sent to Great Britain, approximately \$4,000,000 to the West Indies, \$2,000,000 to Spain and its colonies, \$2,000,000 to the Netherlands and its colonies, and over \$1,000,000 to Portugal and its colonies. The imports were \$25,000,000, of which about one-half came from Great Britain, one-fourth from Spain and her colonies, and most of the remainder from other European countries and their colonies. The chief exports in the beginning were wheat, corn, tobacco, meats, pot and pearl ash, resin, turpentine, tar, and pitch. The chief imports were clothing, wines, sugar, coffee, and miscellaneous merchandise. By 1800 imports had grown to \$91,000,000 and the exports to \$72,000,000, but over one-half of the exports was merchandise from the West Indies and other countries reexported to Europe, the domestic exports of the year 1800 amounting to only \$32,000,000. This large influx of foreign goods for reexportation was but temporary, and by the year 1820 foreign merchandise formed but 25 per cent of the total exports, 10 per cent in 1840, 5 per cent in 1860, about 4 per cent in 1870, and in more recent years less than 2 per cent of the total merchandise exported. The table above shows the total foreign trade of the United States at 10-year intervals from 1790 to the latest date available, the figures being for fiscal years except for 1920, which is for the calendar year.

renders impossible any close analysis of the trade prior to 1821. Beginning with that date, however, the imports and exports by greater groups of articles are as stated in the tables herewith.

Modern Conditions.—The tables give an opportunity to study the growth in the national trade and the changes in its character. Especially suggestive in determining the changes in the character of the trade are the figures which show the percentage which each group of products forms of the total value of the trade. The value of the domestic manufactures produced has grown from \$1,000,000,000 in 1850, the earliest census of manufactures, to over \$62,500,000,000 in 1919, and for these purposes much material was required from other countries. The raw material imported for manufacturing includes fibres, silk, Egyptian cotton, and India rubber. The partly manufactured material includes such articles as tin, copper, wood pulp, and timber. The crude foodstuffs imported include coffee, tea, cocoa, fruits, and rice, while those classed as part or whole manufactures include sugar, canned and dried or salted fish, dried fruits, and other articles of this character. On the export side the raw materials for manufacturing are chiefly cotton and lumber. Those classified as crude foodstuffs are chiefly wheat, oats, corn, and other cereals; those classified as part or whole manufactures are flour, meats, dried and preserved fruits, canned fish, breakfast foods, dairy products, etc. The manufactures exported under the classification of manufactures for further use in manufacturing include pig copper, pig and bar iron, structural materials, leather, lumber, and builders' hardware. The manufactures exported in condition ready for use include agricultural machinery, cars, carriages, automobiles, boots and shoes, clothing, cotton and wool manufactures, iron and steel manufactures, refined min-

eral oils, and many other articles of a miscellaneous character. The group entitled miscellaneous includes animals, except those for food, seeds, trees, plants, etc. The very large increase of this group in 1915 is due to the exportation of a large number of horses and mules to Europe for war purposes.

United States to the southern frontage of South America is about the same as from western Europe to the South American frontage, while prior to the opening of the Panama Canal the eastern parts of the United States had no advantage over those of western Europe in the distance to the western part of South America.

† Chiefly horses and mules to Europe.

From the table it will be readily seen that the share which manufacturing materials form of the imports is increasing, that the share which finished manufactures form of the total imports is declining, and that foodstuffs, while increasing in the total, show no marked change in the share which they form of the grand total. On the export side manufacturing material, which is chiefly cotton, shows a large increase in exports and a slight increase in the share of the total, foodstuffs show a slight decline in value of exports and a marked decline in the share which they form of the total, and manufactures show a marked increase both in the total value and in the share which they form of the grand total of exports. It is thus apparent that the hope for further growth in the exports of the United States lies chiefly in manufactures. The large population requires the bulk of the foodstuffs and a growing share of the manufacturing material, while manufactures are increasing more rapidly than domestic requirements.

The conditions above noted, the increasing import of manufacturing material and tropical foodstuffs, and the increasing export of manufactures have had before 1920 a marked effect upon trade with the various sections of the world, as shown in the table.

One feature of the trade of the United States which has received much attention in recent years is that with South America. This continent is looked upon by many as a field in which the United States should rapidly increase its trade by reason of what is usually considered its close proximity. In fact, however, the distance by steamship from the eastern parts of the

The opening of the Panama Canal, coupled with the suspension of the activities of the European exporters and European shipping during the War of 1914-18, resulted in a material increase in the share which the United States supplied to the imports of South America in the calendar year 1920. Another factor in the increase of commerce with South America is found in the disposition of American exporters to grant longer credits than they had formerly given, while the establishment of branch banks in several South American countries by the National City Bank of New York aided in a closer trade and financial relationship between the United States and South America.

Another feature of the commerce of the United States which has greatly developed during recent years is the trade with its noncontiguous territory. The exports to Alaska in 1904 were \$9,510,000 and \$36,876,855 in 1920; the imports therefrom were \$10,229,000 in 1903 and \$60,939,061 in 1920. To Porto Rico the exports of 1897, before the beginning of the war with Spain, were \$2,252,000 and \$67,799,541 in 1920; the imports therefrom were \$1,690,000 in 1897 and \$158,322,083 in 1920. To Hawaii the exports of 1897, the year before annexation, were \$6,800,000 and \$74,552,453 in 1920; the imports therefrom \$15,962,000 in 1897 and \$192,383,185 in 1920. Thus exports to the noncontiguous territories, which aggregated \$16,690,000 in the years above named, were \$232,766,913 in 1920, while the imports therefrom grew in the same period from \$31,711,000 to \$411,644,329.

The foreign trade of the United States in the period of the great European War (1914-18)

showed many striking changes. The beginning of the war period was one of great confusion in trade matters. Exports of cotton greatly declined owing to the dangers of ocean transportation, and the manufacturers of the United States, uncertain as to the future of trade, reduced their importation of manufacturing materials. Soon, however, heavy demands were made by the warring nations for foodstuffs, horses, and then for war material, while cotton exports

against \$22,145,000 in 1913. To Norway, Sweden, and Denmark, the exports of 1920 aggregated \$294,626,052 against \$41,460,000 in 1913.

Shipping. The American shipping industry was revolutionized in 1917 when war was declared against Germany, and in 1919, the year following the peace. The great destruction of world shipping by German submarines during those years threatened not only the commerce of the Allied nations but their very existence. The

increased to nearly their normal. The exports of foodstuffs and horses enormously increased, as did also those of gunpowder and other high explosives, cartridges and shells, guns, automobiles, aeroplanes, harness and leather, military goods, hospital supplies, and other articles of this character required for war purposes. There was also an enormous increase in the exportation of sugar and other foodstuffs. As a result the total value of the exports to Europe rapidly developed in spite of the fact that Germany and Austria-Hungary, formerly large importers of American goods, were unable to obtain supplies from that market. The total value of merchandise exported to Europe in the calendar year 1915, the first full year of the war, was \$2,505,660,000 against \$1,499,573,000 in the calendar year 1913, the latest calendar year prior to the war. This increase continued after the war, and reached the amazing figures for 1920 given in the table above. To the United Kingdom the exports of 1920 were \$1,825,633,197 against \$590,732,000 in 1913; to France \$876,190,970 against \$153,023,000 in 1913; to Italy \$371,762,274 against \$78,675,000; to Russia \$15,446,833 against \$26,910,000 in 1913. To Germany the exports of 1915 were \$311,437,377 against \$351,931,000 in 1913, and to Austria \$19,237,495

necessity was, therefore, for the construction of new ships, and for this purpose there was created by Congress the United States Shipping Board with a subsidiary board called the Emergency Fleet Corporation which had special charge of the construction of ships. Under the operation of this board there had been built, requisitioned and purchased, on April 30, 1919, 243 ships of a deadweight tonnage of 13,953,506. Of these ships 626 were of wood, 18 were composite, 14 were concrete, 1379 were steel (built by contract), 384 steel (requisitioned), and 15 steel (purchased from Japan). These ships were built and launched with extraordinary rapidity. In the month of October, 1918, 78 ships were built with a total deadweight tonnage of 412,308, and in May, 1919, 141 ships were built, with a deadweight tonnage of 795,700. The ships thus produced were put as rapidly as possible into the service and were largely instrumental in enabling the United States to land troops and supplies in Europe within the time necessary, when the Allied countries would have been exhausted.

When the war ended the United States government was thus in possession of nearly 2500 ships of various kinds. Many of these were unfit for commercial use but on April 15, 1919

the Shipping Board was operating 1207 vessels of 6,569,920 tons deadweight. The Shipping Board then gave attention to the establishment and maintenance of various commercial trades for the employment of American tonnage and the furnishing of these trades with suitable vessels. Many of them were employed in European relief, 760,348 tons were employed in European trade, 307,649 in trans-Pacific trade, 573,567 tons in West Indian trade, 864,334 tons in South American trade, and the remainder in the coastwise American trade or in African service. The Shipping Board also gave its attention to the opening up of new trade routes and the development of regular lines to serve foreign commerce. Regular cargo liner service was put in operation over all the leading routes from American ports, and many ships under the control of the Shipping Board were allocated to steamship companies. These operations continued through the following years until in 1921 the total American merchant marine was 18,282,136 tons, and the tonnage in foreign trade was 11,072,398. The Shipping Board made the utmost effort to encourage the trade of American steamship companies. In this it faced serious problems, including the high cost of operation, declining freight rates, representation abroad, solicitation of cargo, trained personnel and pier facilities. An important factor in the success of an American merchant marine must be the establishment in foreign countries of American concerns to handle the vessels and to solicit return cargoes. The general business depression during 1921 seriously affected the trade with Latin America. However, in order to prepare for the resumption of trade, consideration was given to an intensive study of the ways and means of maintaining services with Latin America, which will enable shippers to patronize not only the vessels of the board but all vessels of the American flag. A coastwise service was established between Paranagua, Brazil and ports of the river Plate, with the object in view of giving the local shippers transportation by American flag vessels. The board was also alive to the necessity of shipping passenger service and during the year a number of fast passenger and cargo services were established. A combination passenger and cargo vessel was devised for this service. This was of two types, one known as the "502" type and the other known as the "535" type, the figures referring to the respective lengths of the vessels. The "502" type vessels have accommodations for 84 first class passengers and 465,940 cubic-foot cargo space, with a speed of 14 knots. Six of these vessels were built and maintained regular service during the war. The "535" type have accommodations for 260 first class passengers, 300 steerage passengers, and 466,133 cubic-foot cargo space, with a speed of 17½ knots. Six vessels of this type were built during the year, and operating regular services. Excellent service was also established in 1921-22 to Europe and to the Orient. The first step made by the board was the placing of the vessels in the trade routes which before the war had been of major importance, such as the United Kingdom, continental Europe, the east coast of South America, the Far East, the West Indies, etc., as the congestion in such trades was most severe and the opportunity was at hand for establishing the American flag in the principal services of the world. As vessels

became available, they were distributed between the trade routes of secondary importance. Finally came the establishment of new routes in which the American flag before that time had seldom if ever been seen. On June 30, 1921 the board had a total of 410 general cargo berths of which 393 were between the United States and foreign points and coastwise services in the United States and 17 between foreign ports.

To insure proper and adequate protection of American shipping interests in foreign ports, and to further the policy of placing American merchant marine on a permanent basis, agencies were established in the principal seaports of the world.

The coastwise and intercoastal trade of the United States affords transportation for commodities from one section of the country to the other, such as manufactured products, natural products indigenous of one locality which are required in another; for example, fruit from the Pacific coast, cotton from the South and steel from the East and Middle West. As the coastwise trade of the United States is protected, the Shipping Board made no effort to place ships in this protected trade, except to sell ships to private operators. The board did, however, make an active bid for the control of a large part of the commerce between the United States and Central and South America. This trade consists of exports and manufactured articles, coal, lumber and imports of raw materials and natural products of the South and Central American countries. Prior to the establishment of services by the board between foreign countries, the American flag vessels seldom if ever before engaged in such regular trades, as the trades were in almost every instance controlled exclusively by vessels of foreign registry. The inauguration of the general cargo service added much to the prestige and permanence of transportation by American carriers, as ships had an opportunity of ascertaining from practical experience what American vessels were able to do in ocean transportation. The cargo boats maintained by the Shipping Board, or leased by it, were admirably suited for the work of cargo carrying. They were, of course, obliged to compete with foreign ships.

The most extensive coast trade centres in New York, largely with Boston on the one side and Philadelphia, Baltimore, Norfolk, Charleston, Savannah, Jacksonville, New Orleans, and Galveston on the other. San Francisco is an important centre of the coastwise trade on the Pacific coast, while the Puget Sound ports, especially Seattle and Tacoma, play an important part in the coasting trade with Alaska, and ports are being developed at Los Angeles and San Diego. In 1914 the Panama Canal (q.v.) was opened and this naturally affected the amount of waterborne freight from coast to coast, which previously had been transshipped by rail across the Isthmus of Panama. The shipping facilities afforded by the Great Lakes are of inestimable value. See GREAT LAKES.

Shipping on the Mississippi System.—Prior to the Civil War the Mississippi River system played a much more important part in the development of the interior of the country than did the Great Lakes. The river was but little navigated for purposes of commerce prior to 1778, and for many years it was of importance to its tributary region chiefly as a means of marketing the surplus products of the newly settled region, since freight could not be profitably

transported upstream. The methods used to transport the freight downstream were of the crudest kind. The most common carrier was the flatboat, rudely constructed from timber and without any other propelling force than the current of the river. After it had carried its load to the New Orleans market it was broken up for lumber or deserted. In 1812 the first steamboat was placed upon the river, and, with the improvements that rapidly followed in steam navigation, the upstream traffic also became large. The years 1840-59 constituted the palmy days of Mississippi navigation. Since then, over the greater part of the Mississippi valley, the railroad has obtained most of the passenger traffic and most of the freight, except bulky products, chiefly coal and lumber. See **MERCHANT MARINE OF THE UNITED STATES** for history of American shipping; also **SHIPBUILDING**.

GOVERNMENT

National Government. The outline of the national government is found in the Constitution, framed in 1787 (see **CONSTITUTION**), and various acts of Congress passed in pursuance thereof. In structure and character it is a representative, federal, coordinated, elective, congressional government. Its representative character consists in the fact that the organization of the State is separate and distinct from that of the government. It is federal in that it is part of a dual system under a common sovereignty. The distribution of the legislative, executive, and judicial powers of the central government, among separate and distant organs, contributes the feature of coordination. The popular choice of the executive and law-making branches makes the government substantially elective, while the independence of the executive as over against the legislative makes the system congressional rather than ministerial in method of action. In distributing the powers of government the framers of the Constitution followed Colonial and English precedent and confided to separate and distinct organs the exercise of those functions which were legislative in character, those which were executive, and those which were judicial. The investment of the President with the power to recommend to the legislative department the enactment of laws, the right of a qualified veto on its acts and resolutions, and the right of the lower branch of the Legislature to impeach and the right of the upper branch to try all officers of the United States for certain offenses, are well-known exceptions to the general principle of the separation of powers. The same may be said of the power confided to the upper branch of Legislature to participate with the executive in the appointment of officers and negotiation of treaties with foreign countries.

For the Constitution, see **CONSTITUTIONAL LAW**; **CONSTITUTION OF THE UNITED STATES**; **FEDERAL GOVERNMENT**.

For the legislative branch, see **COMMITTEE**; **CONGRESS**; **LEGISLATION**; **LEGISLATURE**; **PARLIAMENTARY LAW**; **QUORUM**; **REPRESENTATION**; **SENATE**; **SPEAKER**; **ETC.**

For the executive branch, see **CABINET**; **ELECTORAL COLLEGE**; **PRESIDENT**; **STATE, DEPARTMENT OF**; **TREASURY, DEPARTMENT OF THE**; **ETC.**

For the judicial branch, see **COURT**; **SUPREME COURT OF THE UNITED STATES**.

Congress.—The origin of the national Legislature is to be found in the so-called Second Continental Congress of 1775—a revolutionary body

which was called to deliberate upon the state of public affairs growing out of the dispute with Great Britain, and which, with the acquiescence of the people, assumed plenary powers of government and the management of the war. Although its powers were undefined (there being no written constitution), the Congress exercised many of the usual functions of sovereign governments, among which may be mentioned the organization of a diplomatic service and the conclusion of treaties with foreign states; the regulation of commerce; the raising and equipment of armies; the establishment of a post office; the creation of a national currency; etc. Delegates were usually appointed by popular conventions of legislatures, the Congress was organized in one chamber, and the States enjoyed equality of representation. The Articles of Confederation, ratified in 1781, changed the basis of the Congress from a revolutionary assembly to a constitutional body and undertook to define its powers and regulate its constitution. The principle of equality of representation and the unicameral form of organization were, however, continued; besides, its efficiency as a national legislature was impaired by other unwise provisions. It did not possess the power of taxation, nor did its commands operate upon individuals, but rather upon States which could not be coerced. A few years' experience showed that it was unequal to the task of a national legislature, and when the Constitutional Convention of 1787 came to deliberate upon the structure and powers of Congress it was practically unanimous in favor of the bicameral organization and of vesting Congress with more adequate powers. The troublesome question of representation was settled by an arrangement which protected the small States by giving them equality of representation in one chamber, and the large States by proportional representation in the other.

Congress was given adequate power over the source of the national revenue, besides other powers inherent in a national legislature. All its powers were enumerated by the Constitution, while a number of express prohibitions were inserted in behalf of individual liberty. Lest an express enumeration of its powers might operate to deprive it of discretion in choosing the appropriate means of carrying into execution the powers granted, a so-called "elastic clause" was inserted empowering Congress to pass all laws deemed necessary and proper to carry out the powers expressed. Compared with the vast range of powers left with the States, the few powers conferred upon Congress seem quite insignificant, and this disparity seems all the more noticeable when compared with the omnipotence of the British Parliament. But the apparently narrow powers vested in Congress have been rather broadly construed by the Supreme Court throughout the entire period of the national history. With the sanction of the court, sometimes under the stress of emergency, but more frequently in time of peace, Congress has steadily extended its powers in every direction, exercising functions which were probably never intended by the framers of the Constitution to be assumed by it. Thus under the simple power to lay and collect taxes (doubtless for revenue only), Congress has employed its power to destroy State bank currency, to encourage certain industries and destroy others, and to restrict commercial intercourse. In pursuance of the power to coin money and pay debts it has es-

tablished national banks, issued bills of credit, and given the legal-tender quality to its treasury notes. Under the power to establish post offices and post roads it has made a government monopoly of the entire postal service, established a money-order and parcels post system, and provided for free delivery of mail in cities and in many rural communities. Under the power to regulate foreign and interstate commerce it has regulated not only traffic, but telegraphic intercourse and navigation on rivers and canals. This power has been employed also for the purposes of prohibition, reciprocity, retaliation, and revenue. It has included the laying of embargoes, the enactment of nonintercourse and nonimportation and quarantine laws, the dredging of harbors, the erection of lighthouses, beacons, buoys, etc. Likewise Congress, without express authority, has acquired foreign territory, erected it into States, and governed its inhabitants without their consent. It has made large grants of land to aid in the construction of railroads, passed laws to regulate and control federal elections, governed rebellious States through military agency, conferred suffrage upon the negroes, and undertaken to secure for them equality of treatment in public places. During the controversy over Reconstruction it encroached seriously upon the sphere of the executive and the courts declined to interfere in the latter's behalf.

In reviewing the first century and a quarter of the history of Congress and its place in the scheme of government, several criticisms are worthy of note. These are the practice of choosing members from local districts, short tenures of Representatives, the large and unwieldy size of the Lower House, the long interregnum between the time of the election and the organization of the Congress, the shortness of the second session, and the exclusion of the cabinet from seats in either House.

State Government. The Constitution of the United States provides that all powers not delegated to the United States nor prohibited by it to the States are reserved to the States respectively or to the people. Those powers absolutely prohibited to the States are the conclusion of treaties, alliances, or confederations among themselves; the granting of letters of marque and reprisal; the coining of money; the issue of bills of credit; the making of anything but gold and silver a tender in payment of debts; the enactment of ex post facto laws, bills of attainder, or laws impairing the obligation of contracts; and granting of titles of nobility. Those prohibited except with the consent of Congress are the levying of duties on imports or exports, except such as may be absolutely necessary for executing inspection laws; the laying of tonnage duties; keeping troops or ships of war in time of peace; entering into agreements or compacts with other States or foreign powers, or engaging in war unless actually invaded or when the danger is such as not to admit of delay.

Upon examination it will be seen that the relation of the citizen to the State government is far more close than with the national government. Nearly the whole domain of civil and religious liberty, education, suffrage, domestic relations, marriage, business transactions, property, professions, trades, contract relations, administration of the criminal law, and many other social and business relationships come within the sphere of the State government. The fundamental law of each State is embodied in a writ-

ten constitution drawn up by a constituent convention and ratified in most cases by the electorate at the polls. The earlier constitutions were brief instruments containing little more than the law for the organization of the government and the necessary safeguards for the protection of civil liberty, but the later ones are bulky documents containing a vast amount of matter which should properly appear in the statutes. In each of the States the legislative power is vested in the Legislature, consisting of a Senate and a House of Representatives, though in six States the latter chamber is styled the Assembly and in three the House of Delegates. Both Houses are chosen by popular vote and by the same electorate, although there are variations as to the mode of choice and tenure. Usually the districts from which Senators are chosen are larger than those from which Representatives are elected, and as a consequence the Lower House is a more numerous body. The Senates range in size from 17 to 63 members, while the number of Representatives ranges from 35 to 390. The Lower House is from two to six times as large as the Senate. The tenure of State Senators is usually longer than that of Representatives. In a majority of the States it is four years, the usual term of a Representative being two years. In many of the States provision is made for partial renewal of the Senate, usually by halves every second year. In a few States the qualifications for eligibility to the Senate are higher than those of the Lower House. The franchise for the election of the Legislature and of all elective State officers is regulated by the State constitutions and is universal suffrage. Prior to the ratification of the 19th Amendment, many of the States had conferred the franchise on women, except that in Arizona, California, Connecticut, Delaware, Maine, Massachusetts, New Hampshire, Washington, Wyoming, and some of the Southern States slight educational tests are required. (For further details, see **SUFFRAGE; REPRESENTATION; WOMEN'S SUFFRAGE.**) In all the States members of the Legislature receive salaries, which are the same for members of both Houses. The amount ranges from \$3 a day and mileage in Kansas and Oregon, or \$2 and mileage for a regular session in New Hampshire to \$1500 a year and mileage in New York and Pennsylvania. In most of the States the constitution provides for biennial sessions of the Legislature. In Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and South Carolina annual sessions are required, while in Alabama regular sessions occur every four years. In most of the States the length of the session is left to the discretion of the Legislature, in others it is limited by constitutional provision. The powers of the Legislature relative to organization, procedure, adjournment, privileges, etc., are similar to those of Congress. The executive power in each State is vested in the Governor, popularly elected for a term ranging from one year in Massachusetts to four years in 22 States and five in New Mexico. In about three-fourths of the States there is a Lieutenant Governor, who succeeds to the governorship in case of a vacancy. The Governor's salary ranges from \$2500 in Nebraska and Vermont to \$10,000 in California, Massachusetts, New Jersey, New York, Ohio, and Pennsylvania, and \$12,000 in Illinois. In a few States he is ineligible to succeed himself. His duties and powers include

the execution of the laws, the furnishing of the Legislature with information at the beginning of its session, the calling of it together in extraordinary session, the appointment of certain officers, usually with the consent of the Senate, the granting of reprieves and pardons, the veto of legislative measures except in four States (see VETO), and the command of the militia. In several of the States where there has been a traditional fear of the executive power, the Governor's prerogatives are very narrow—he has no veto power and but little power of appointment. To aid the Governor in the administration there are in every State a number of executive departments, at the head of which are officers usually chosen at the same time, in the same manner, and for the same term as himself. These are the Secretary of State, the Treasurer, the Attorney-General, the Auditor or Comptroller, and the Superintendent of Public Instruction. Besides, there are frequently such officers as commissioners of railroads and of canals, insurance, agriculture, labor, immigration, charities, etc. Formerly such officers were, as a rule, popularly elected, but in recent years there has been an increasing resort to commissions, especially for the control of public utilities, workmen's compensation, minimum wages, etc.; these are appointed by the Governor with consent of the Legislature. The position of the heads of the State executive departments is in no sense similar to that of the President's cabinet, since the Governor has little or no power over them.

In each State the judicial power is vested in a supreme court or court of appeal, one or more superior courts known by different names, and a series of local courts of various kinds. In several States the supreme court is such only in name, there being a court of last resort above it, usually known as court of appeals or court of errors and appeals. Texas has two supreme courts, one for civil and the other for criminal cases. The size of the supreme courts ranges from three justices to 16, the number usually being odd. The salaries of members of the State supreme courts range from \$2500 in Vermont to \$17,500 in New York. Next below the supreme courts are the superior courts, sometimes called circuit courts, having jurisdiction over a group of counties with the power to hear appeals from the lower courts. Usually there is also a county court, which is known by different names and which has a wide original jurisdiction in both civil and criminal matters and appellate jurisdiction over the decisions of the justices of the peace. These justices of the peace have original jurisdiction in minor civil and criminal cases, with power to impose fines, to commit to prison for short periods, and to bind over accused persons to await the action of the grand jury. In the towns and cities there is usually a separate class of municipal courts. (See MUNICIPAL GOVERNMENT.) There are also probate and chancery courts in some States. Formerly the State judges were generally appointed by the Governor or chosen by the Legislature, but now in a great majority of the States they are popularly elected. In four States the Supreme Justices are still elected by the Legislature; in eight they are appointed by the Governor with the consent of the Council or Senate. The early rule was good-behavior tenure, but now that rule prevails only in Massachusetts, Rhode Island, and New Hampshire. Elsewhere the term varies from two years in Vermont to 21 in Pennsylvania.

Local Government. Three general types of local government prevail in the United States. They are the town system in New England, the county system in the South, and the mixed system in New York, Pennsylvania, New Jersey, and a number of the North Central States. In the town system the sovereign local authority is the town meeting, or general assembly of all the qualified voters of the town. A regular annual session of this assembly is held in the spring, and extra sessions are held throughout the year as necessity requires. At the annual meeting, which is presided over by a moderator, the town officers are elected, the local budget passed, and other matters of local interest decided upon. The principal town officers are a number of selectmen, ranging from three to nine, who are the general managers of the town affairs; the town clerk, who is the keeper of the records; the treasurer; the tax assessors; the tax collector; the school committee; and a variety of minor officers such as constables, overseers of the poor, surveyors, fence viewers, etc. Where the pure town system prevails the county plays but little part in local administration, and in some States like Rhode Island there are, strictly speaking, no county officers, the county being merely a judicial district without corporate personality.

In the Southern States, where the county type of local government prevails, conditions are reversed. There the county is the political unit, and the administration of all local matters, except educational and municipal affairs, is intrusted to county officers. The chief county authority is the board of county commissioners or supervisors, each member of which represents one of the magisterial districts into which the county is divided. There is no authority which corresponds to the New England town meeting. Besides the commissioners, the chief county officers are the sheriff, the clerk, the commissioner of education, the coroner, the assessor, and sometimes a tax collector, although the collection of the taxes is a duty generally imposed upon the sheriff. The subdivisions of the county in some States are known as precincts, in others as townships; in Delaware as hundreds, in Georgia as militia districts, in Louisiana (where the counties are called parishes) as wards, in Maryland as election districts, in Mississippi as supervisor's districts, etc. In the Southern States they are mere judicial or election districts. In each are usually to be found one or more justices of the peace and their ministerial officers or constables, but the districts are in no sense political corporations.

The mixed system which originated in New York and Pennsylvania is a compromise between the two types described above. Here both the town and county elements exist, but are combined in different ratios. In New York the chief local authority is the board of supervisors, consisting of a representative chosen from each town in the county. In Pennsylvania it is a board of three commissioners elected from the county at large. The New York supervisor presides over the town administration, while the Pennsylvania commissioner is in no sense a township officer. In the mixed type the town or township is a body corporate and politic. Each has its clerk, assessor, collector, commissioner of highways, justices of the peace, constable, etc. In New York there is an annual town meeting at which local officers are elected and matters of poor relief, taxes, schools, etc., attended to. In the

pure Pennsylvania form the town meeting does not exist, town affairs being managed by a corps of officers elected by the people of the town. The New York, or supervisor, type of local government has been adopted in Michigan, Illinois, Wisconsin, Nebraska, New Jersey, and elsewhere. The Pennsylvania, or commissioner, system has been transplanted to Ohio, Indiana, Iowa, Kansas, and Missouri, and in a modified form to Minnesota and the Dakotas. For local government in the towns and cities, see MUNICIPAL GOVERNMENT.

FINANCES

Statistics. The finances of the United States are characterized by rapid increase in magnitude of fiscal operations, and by the great facility with which revenues are secured. The federal government has with rare exceptions derived nearly all its revenue from tariff duties and internal-revenue taxes, but the need of vast sums during the war made it necessary to levy other taxes. The total ordinary receipts for 1922 were \$4,109,104,150. The principal sources were: customs, \$356,443,587, an increase over the estimates—\$235,000,000 internal-revenue; \$2,068,128,192 from income and profits tax and \$1,145,125,064 from miscellaneous sources.

The grand total receipts for the fiscal year 1922 amounted to \$10,126,261,803; the total ordinary expenses of the government amounted to \$3,372,607,899, and the grand total of expenditures to \$10,403,834,396. The total expenditure on account of the public debt was \$7,031,226,496. The total gross public debt on June 30, 1922 was \$22,963,381,708, as compared with \$23,977,450,552 on June 30, 1921, a reduction during the fiscal year of over one billion dollars. This was brought about through refunding operations, by which various loans made during the war were reduced. The enormous increase in the public debt as well as the increase in annual expenditures of course reflects the financial cost of the war, which was borne chiefly by the floating of bonds sold to the people. There were four issues known as Liberty Bonds and an issue known as Victory Bonds issued after the war. As these bonds mature, they must be paid or refunded. On the first Liberty Loan the amount issued was \$1,989,455,550; on the second Liberty Loan, \$3,807,865,000; on the third Liberty Loan, \$4,175,650,050; on the fourth Liberty Loan, \$6,964,581,100; and on the Victory Loan, which was in notes instead of bonds, \$4,495,373,000. The first Liberty Loan is redeemable on or after June 15, 1932; the second Liberty Loan on or after November 15, 1927; the third Liberty Loan, September 15, 1928; the fourth Liberty Loan, October 15, 1938; and the Victory Loan, May 20, 1923. The necessity for funds for carrying on the war made it necessary to levy income and profit taxes which produced a considerable proportion of the necessary funds. See FINANCE.

Financial History. Down to the adoption of the Federal Constitution the finances of the central government were in an extremely chaotic condition. In 1775 the Continental Congress undertook to establish a Continental army and navy, but no power had been delegated to Congress to raise revenue by taxation to meet the attendant expenditures. Congress was therefore forced to rely upon the issue of bills of credit,

the proceeds of loans, foreign and domestic, and requisitions upon the various States, which the latter could honor or not as they saw fit. From 1775 to 1783 it is estimated that the income of the Continental Treasury, estimated in specie, amounted to \$65,863,825, of which about \$37,800,000 was secured through the issue of bills of credit, \$19,416,000 through loans, and \$5,795,000 through requisitions upon the States.

Under the Articles of Confederation the financial position of the central government was but little stronger. It was provided that the expenses of the national government should be defrayed by taxes apportioned to the States in proportion to the value of land and improvements. Congress had power to emit bills of credit and to contract loans; but since the States levied the apportioned taxes according to their own discretion, there was no certainty that such loans could be repaid when due. By 1786 the credit of the government had fallen so low that it was practically impossible to secure loans, while the proceeds of the apportioned taxes did not meet the running expenses of government. Efforts to amend the articles so as to make possible a national tax proved unavailing, owing to the provision that unanimous consent of the States should be necessary for amendment.

From this state of affairs the country was rescued by the adoption of the Federal Constitution, which gave Congress wide powers of taxation. By the Act of July 4, 1789, import duties were levied; in the following year the national debt was reorganized and augmented by the assumption of the State debts incurred in the War for Independence. In 1791 the first national bank was organized to aid in placing the governmental finances on a sound footing. (See BANK, BANKING.) As the tariff of 1789 did not furnish revenue enough to meet current expenses, including the interest on the public debt, Congress in 1791 laid an excise tax upon spirits, which was further extended in 1794 to cover a considerable number of articles. In 1798 a direct tax was levied upon lands, dwelling houses, and slaves. Both the excise and the direct taxes were unpopular and unproductive, yielding in all only \$1,582,000 in 1801. The customs duties, on the other hand, increased from \$4,399,000 in 1791 to \$10,751,000 in 1801.

From 1801 to 1811 revenue largely exceeded expenditures, in spite of the repeal of the excise taxes in 1802. The national debt was reduced from \$83,000,000 to \$45,200,000. With the outbreak of the War of 1812, customs duties fell off with the ruin of commerce, while military expenditures made a heavy drain upon the national resources. Excise duties were repugnant to the principles of the Republican party, then in power; accordingly it was necessary to finance the war chiefly by means of loans and the issue of treasury notes. Up to the end of 1814, \$41,010,000 was borrowed; by February, 1815, \$36,680,000 in treasury notes had been issued, of which, however, part was issued to pay off earlier issues, the largest amount outstanding being \$17,619,000 in 1816. In 1813 a direct tax of \$3,000,000 was levied, and in 1814 excise taxes were again imposed. These taxes were repealed in 1817 with the increase in customs revenue attendant upon the renewal of foreign commercial relations. From 1816 to 1835 revenue exceeded expenditures so far as practically to extinguish the national debt in the latter year. In 1836 and 1837 a surplus accumulated, which was distrib-

uted to the States in the guise of a loan in 1837, about \$28,000,000 being disposed of in this way. An important item in the revenues of 1834-37 was the proceeds from the sale of public lands. From 1810 to 1830 the sales of public lands had yielded an annual income ranging from \$1,000,000 to \$2,000,000; in 1834 the yield was about \$15,000,000; 1835, \$14,767,000; 1836, \$24,877,000; 1837, \$6,776,000.

The table below gives receipts and expenditures for typical years from the adoption of the Constitution down to the Civil War.

The years 1837-43 showed a series of deficits owing to decline in revenue through commercial depression, and increase in expenditures due chiefly to greater expense in managing Indian affairs and the undertaking of internal improvements. It became necessary to resort again to the issue of treasury notes and the sale of bonds. An increase in tariff rates in 1842 restored the balance and created a surplus, which was turned into a deficit by the expenses of the Mexican War. Between 1846 and 1851 the national debt

YEAR	Total ordinary receipts	Expenditures
1792.....	\$3,669,000	\$8,269,000
1801.....	12,935,000	9,393,000
1811.....	14,422,000	8,178,000
1814.....	9,800,000	34,720,000
1816.....	47,677,000	31,196,000
1821.....	14,573,000	15,842,000
1831.....	28,526,000	15,237,000
1841.....	16,860,000	26,482,000
1850.....	43,592,000	40,948,000
1860.....	56,054,000	63,201,000

increased from \$15,550,000 to \$68,304,000. By 1857 the debt had been reduced to \$28,700,000. A new series of deficits began with 1858, which increased the indebtedness about \$50,000,000 by 1860, when the Morrill Tariff Act restoring higher duties supplied revenue in excess of expenditures.

For finances of the Civil War and the subsequent period, see DEBT, PUBLIC; FINANCE; SPECIE PAYMENTS, SUSPENSION OF; ETC.

Money. By an Act of March 4, 1900, the gold dollar weighing 25.8 grains was made the standard of value of the monetary system. The gold coins in common use, however, are the 5, 10, and 20 dollar pieces. Silver dollars, half dollars, etc., are also coined and accepted as convenient mediums of exchange. Silver and gold certificates are issued by the government, for the repayment of which a fund of \$150,000,000 in gold has been established. For further particulars, see MONEY; COINAGE; ETC.

Weights and Measures. The United States system of weights and measures is fully discussed in the general article on WEIGHTS AND MEASURES.

ARMY

Military History. The first step towards the establishment of a military force under the control of the Continental Congress was taken June 15, 1775, when that body resolved that a general be appointed to command all the Continental forces raised or to be raised for the defense of American liberty and unanimously elected George Washington.

One year later (June 13, 1776) the Continental Congress created a Board of War, the

germ of the modern War Department. The Revolution was a great war school for the crude but patriotic bands that rallied under Washington's standard, and the regular army of to-day rests upon the foundation then laid, after European methods. Thus the United States articles of war are copied from the British military code; the principles of discipline, drill, and accountability for property survive as they were prescribed by the aid-de-camp of Frederick the Great, Baron Steuben; while the French volunteer Baron du Portail became the first chief of engineers.

In September, 1776, the Continental Congress appointed a committee to confer with the general officers of the army with the view of creating a system of instruction which would furnish officers educated in the theory of military art and science. This was the origin of the Military Academy at West Point, which institution, however, was not formally established until 1802.

Notwithstanding Washington's wise counsel, that provision should be made for a permanent and well-equipped army, the close of the Revolution saw the seasoned veterans return to their farms and other civil avocations. Congress, swayed by the arguments that "standing armies in time of peace are inconsistent with the principles of republican government and dangerous to the liberties of a free people," and that "the United States being remote from nations having peace establishments and by being always in a state of defense, on the plan of the confederation, which provides that every State shall always keep up a well-regulated and disciplined militia," directed the discharge of "the troops now (May 26, 1784) in the service of the United States, except 25 privates to guard the stores at Fort Pitt and 55 to guard the stores at West Point and other magazines with a proportionable number of officers," no officer to remain in service above the rank of captain.

War with a civilized power was no sooner ended than the need of provision against Indian hostilities became apparent; the Articles of Confederation framed for protection against the greater danger were found ineffective in dealing with the lesser evil. The recommendations of Congress fell upon deaf ears; each State was busy with its own immediate affairs, and the Continental Legislature was compelled (June 3, 1784) to augment its nucleus of 80 enlisted men by the enrollment and equipment of a small regiment of foot soldiers; later (Oct. 20, 1786), a battalion of artillery was added, and so by degrees the nucleus of a national force was formed which in 1788 amounted to 595 men, commanded by Lieutenant Colonel and Brevet Brigadier General Josiah Harmar.

The establishment of a permanent land force for the national defense, otherwise known as the regular army, legally dates from March, 1789, a few weeks before the inauguration of Washington as President under the Federal Constitution. The troops then in service already mentioned now became the Regiment of Infantry and Battalion of Artillery and eventually (1791) became known as the First Regiment of Infantry (Lieutenant Colonel Harmar) and the Battalion of Artillery (Major Doughty) respectively.

For more than 100 years after that date the army served as the strong right arm of the government, at times engaged in holding back the Indians from border settlements, protecting the

western advance of the nation, and in five wars forming the backbone of the great forces called out to meet the emergencies. Withal the regular army performed these varied duties quietly but effectually. It produced Grant, Lee, Sherman, Sheridan, Thomas, Jackson, and a host of able commanders of less renown, but yet distinguished on the roll of fame. The conspicuous traits of the American regular are his individuality, fertility of resource, and unswerving loyalty to his government; the officers especially exhibiting, since the Spanish-American War, an unexampled capacity for the administration of civil affairs, assuming at a moment's notice duties ranging in importance from those of Governor-General and Judge of the Supreme Court to collector of customs and chief of police, and discharging them with marked ability and fidelity.

The Staff. Next to the training and equipment of the line and the selection of competent leaders, the question of a staff early received the attention of the Board of War. The value of the services of the foreign officers who as volunteers organized, drilled, and inspected the army and aided materially in achieving the success of the American operations had deeply impressed Washington, who upon the eve (1798) of his resuming the command of the army thus addressed the Secretary of War: "In forming an army, if a judicious choice is not made of the principal officers, and, above all, of the general staff, it can never be rectified thereafter. The character then of the army would be lost in the superstructure. The reputation of the commander in chief would sink with it and the country be involved in inextricable expense."

* Major general. † General. ‡ Brigadier general. Josiah Harmar was a lieutenant colonel commandant and brigadier general by brevet. § Lieutenant general.

The first staff officers appointed by Washington upon assuming command at Cambridge (1775) were an adjutant general (Horatio Gates), a quartermaster-general (Thomas Mifflin), and a commissary general (Joseph Trum-

bull). Under them from time to time during the war were temporarily appointed officers of the line as assistants. As far back as 1777 the Continental Congress had "Resolved, . . . that it is essential to the promotion of discipline in the American army and to the reformation of the various abuses which prevail in the various departments that an appointment be made of inspectors general, agreeable to the practice of the best disciplined European armies." The first practical result of this action was shown in the selection of Baron Steuben, who may justly be considered the originator of much that is admirable in the staff system of the United States army. Although he had held the rank of lieutenant general in the Prussian army, he did not hesitate to serve at first as a volunteer, pending his appointment as inspector general with rank of major general (May 5, 1778).

At the close of the war Baron Steuben resigned his commission, receiving the thanks of Congress, "for the great zeal and abilities he has discovered in the discharge of the several duties of his office," together with the gift of a "gold-lilted sword." Towards the close of his life Steuben prepared a manual of "Regulations for the order and discipline of the troops of the United States" and for governing the militia (Portsmouth, N. H., 1794), still a model of its kind.

* From 1902 to 1916 the Law of 1901, with slight modifications, remained in force. This law, approved Feb. 2, 1901, authorized the President to enlist natives in colonial possessions, but required that the total enlisted strength of the regular army, including natives, should not exceed at any one time 100,000.

Although, from time to time during the American Revolution, suitable persons were appointed to perform staff duties, yet the existing staff departments date their permanent establishment as follows: adjutant general's, March 3, 1813; inspector general's, March 3, 1813; judge advocate-general's (Bureau of Military Justice, 1864), July 5, 1884; quartermaster's, March 28, 1812; subsistence, April 14, 1818; medical, April 14, 1818; pay, April 24, 1816; engineers, March

UNITED STATES FLAGS

11, 1779, (present corps of) March 3, 1863; ordinance, May 14, 1812; signal (corps), March 3, 1863. The *Journal of the Continental Congress*, Washington's orders, and the Revised Statutes teem with interesting historical and biographical data relating to these staff departments for which space here is denied. Out of the crude measures of a great crisis has grown a governmental system which, if not perfect, has through its personnel accomplished wonders. The names of Steuben, Trumbull, Rush, Morgan, Bernard, Townsend, Meigs, Ingalls, Myer, Fry, and Weston are those of a few of the men who, in spite of imperfections of organization, of official dry rot, and a false sense of security from perils that at times threaten the most favored nations, were

equal to the emergency of war and achieved great distinction in their several departments. In these staff departments often have been felt the effects of legislation by Congress and schemes for the reorganization of the army.

Modern Establishment. The war with Spain (1898) called public attention to some of the imperfections of the American military administration, and discussion of the shortcomings brought about a plan of organization unprecedented in the history of the army. The Philippine insurrection, requiring the occupation of the archipelago at one time by a force of 65,000 men (regulars and volunteers), became in its turn an object lesson in the formation of a permanent military establishment suited to the new conditions. The regular force of 1897, expanded by Congress the following year to 63,000, was in 1899 reinforced by 35,000 volunteers, exceptionally efficient, as nearly all had seen service in Cuba and the Philippines, and were organized into regiments commanded by selected regular officers. During two years following these troops were incessantly engaged in fighting the Filipinos under the unfavorable conditions of climate, terrain, and the treacherous character of the enemy. Besides the service in the Philippines, the regular contingent there was drawn upon for the China relief expedition to the extent of 2000 men.

IMPORTANT CAMPAIGNS AND EXPEDITIONS

IN WHICH THE ARMY HAS TAKEN PART

1790-95	War with Northwestern Indians.
1794	Whisky Insurrection (Pa.).
1803	Sabine expedition (La.).
1811-13	War with Western Indians.
1812	Seminole disturbances (Fla.).
1812-15	War with Great Britain.
1813-14	Creek Indian War (Ala.).
1817-18	Seminole War (Fla.).
1823	Blackfoot Indian campaign.
1827	Winnebago Indian expedition.
1832	Black Hawk War.
1835-42	Seminole War (Fla.).
1836-37	Creek Indian disturbances (Ala.).
1836-39	Cherokee disturbances.
1838-39	New York frontier disturbances.
1846-48	Mexican War.
1848	Cayuse Indian War (Oreg.).
1849-61	Navajo Indian troubles (N. Mex.).
1849-61	Indian disturbances (Tex.).
1850	Pitt River expedition (Cal.).
1851-52	Yuma expedition (Cal.).
1851-56	Snake, Sioux, Yakima, Cheyenne, and Arapahoe Indian War.
1855-57	Seminole War (Fla.).
1857	Gila expedition (N. Mex.).
1857-58	Utah expedition.
1858	Puget Sound and other Indian troubles.
1858-59	Wichita (Ind. Ter.), Colorado River (Cal.), Pecos and Antelope Hills (Tex.), and Bear River (Utah) expeditions.
1859-60	Cortina troubles on Texas-Mexican border.
1860	Kiowa-Comanche (Ind. Ter.) and Carson Valley (Utah) expeditions.
1860-61	Navajo expedition (N. Mex.).
1861-66	Apache Indian War (Ariz. and N. Mex.).
1861-65	Civil War.
1862-67	Sioux War (Minn. and Dak.).
1863-69	Indian War (Kans., Neb., Colo., and Ind. Ter.).
1865-68	War with Northwestern Indians.
1865-66	Fenian raid (N. Y. and Canada).
1867-81	Campaigns against Indians and Mexican border disturbances.
1868-69	Canadian River expedition (N. Mex.).
1871	Yellowstone expedition.
1872-73	Modoc War.
1873	Yellowstone expedition.
1874-75	Indian campaign (Ind. Ter.), Sioux (Wyo. and Neb.), Black Hills (Dak.), and Big Horn (Wyo.) expeditions.
1875	Expedition against Indians (Nev.).
1876	Powder River expedition (Wyo.).
1876-77	Big Horn and Yellowstone expeditions (Wyo. and Mont.).
1876-79	War with Northern Indians.
1877	Labor strikes (Pa. and Md.).
1877	Nez Percés campaign.
1878	Bannock and Piute campaigns (Nev. and Idaho), and Ute Indian expedition (Colo.).
1879-84	Disturbances in Ind. and Okla. Ter., and Ute Indian campaign (Colo. and Utah).
1885	Chinese mining and labor troubles (Wyo. Ter.).
1890-91	Sioux Indian troubles (S. Dak.).
1891-93	Garcia troubles (Texas-Mexican border).
1894	Labor disturbances (Ill.), and labor strikes (Ill. to Pacific coast).
1898	War with Spain.
1899-1902	Philippine insurrection.
1900	China relief expedition.
1906-09	Cuban pacification.
1914	Occupation of Vera Cruz.
1911-16	Mexican border patrol.
1916	Pursuit of Mexican bandit Villa.
1917-19	Operations in Europe.

On Feb. 2, 1901, Congress authorized a permanent increase of the army (discretionary with the President except artillery) not to exceed 100,000 men, including 12,000 native troops for service in Porto Rico and the Philippines. This force consisted of 15 regiments of cavalry, 30 of infantry, 3 battalions of engineers, a corps of artillery, and the staff departments. In June of that year all volunteers were mustered out. In July, 1902, the President, in the exercise of the discretion vested in him by law, the United States

having recognized the independence of Cuba and having placed the greater part of the Philippine Islands under civil government, materially reduced the army until the aggregate strength in 1907 was 4016 officers and 68,301 men.

The most radical change in the organization was that of the artillery. For many years nominally it was regimental, but practically the unit for administration and operation was the battery. The system of coast defense lacked cohesion, consisting simply of a number of independent posts commanded by officers who, having reached the rank of field officer after 30 or 40 years' service as light battery commanders in the Civil War or with infantry garrisons in peace were content to rest on their laurels. Under the influence of Secretary of War Root the seven regiments of artillery were merged into a corps, supervised by a chief, with his station at the headquarters of the army, and consisting of 126 companies of coast artillery and 30 batteries of field artillery. The companies were grouped within a number of artillery districts, and each district placed under command of a competent field officer. In 1907 the corps was reorganized into two separate branches of the service, the field artillery being increased and organized as six regiments of two battalions each, each battalion consisting of three batteries of four guns each.

Another important item in the legislation of 1901 was the change from a permanent to a detailed staff. By the law vacancies occurring in the adjutant general's department, the inspector general's department, the subsistence, pay, and quartermaster departments (later consolidated as the quartermaster corps, q.v.), the ordnance department, and the signal corps are filled by detailing officers of the line for four years only, after which they return to the line regiments. The general staff corps was established in 1903, the chief of which, selected by the President for a term of four years only, replaced the commanding general of the army, who formerly commanded by virtue of his seniority and retained command until retired from active service. Under the new system the President, the commander in chief of the army and navy, selects the general officer, irrespective of his rank, who in his opinion most satisfactorily can carry out the views of the administration with respect to the army.

After the creation of the general staff corps in 1903 the War College (q.v.) was established at Washington, D. C. For other schools, see MILITARY EDUCATION.

Organization of the Army and Organized Militia. Under the constitution the President is commander in chief of the army, the administration of which is in the hands of a civilian Secretary of War, who is a member of the cabinet, and an Assistant Secretary of War, also a civilian. The chief of the general staff, a general officer of the army, selected and appointed by the President for a term of four years, is the military adviser of the President and the Secretary of War and has general supervision over the staff bureaus and the line of the army, exercising authority in the name of the Secretary of War and not by virtue of his rank, which may be inferior to that of other general officers.

Higher Organization.—For the first time in the history of the army in peace the President, on Feb. 6, 1913, directed that an order be issued

organizing the troops of the mobile army into permanent tactical divisions and brigades. Although in 1916 the divisions were incomplete, there were three infantry divisions within the continental limits of the United States, with headquarters as follows: first division, Governor's Island, N. Y.; second division, Chicago, Ill.; third division, San Francisco, Cal. One cavalry division was organized with headquarters at San Antonio, Tex. There were also two independent cavalry brigades. The coast artillery troops in the United States were organized into three coast artillery districts—the North Atlantic, the South Atlantic, and the Pacific. The three infantry regiments in Hawaii were organized as the First Hawaiian Brigade. The troops in the Philippines were not organized as a tactical division. In the Panama Canal Zone was stationed a reinforced brigade.

The entrance of the United States into the War of the Nations, in April, 1917, brought vast changes in the military policy of the country, and Congress was at once asked by President Wilson to pass measures which would enable the necessary increase in the military forces. The National Guard was mobilized in accordance with the legislation already in effect, and on May 18, 1917, Congress passed the Selective Draft Act which authorized the President immediately to increase the regular army to the full extent provided by the National Defense Act of 1916, and to raise by draft a force of 500,000 men, with the necessary officers and another similar force of equal strength at a later date at his discretion. The draft was made applicable to all male citizens or persons not alien enemies who had declared their intention to become citizens, between the ages of 21 and 30 years, both inclusive. It was provided also that the Regular Army and National Guard should be raised to and maintained at their maximum strength by voluntary enlistment, in so far as might be possible, the draft to be resorted to in these cases also, and the President might decide that the number of volunteers was insufficient for the purpose. For the details which accompanied the carrying out of these and later measures see the article ARMY ORGANIZATION, and VOLUME XXIV. The army reorganized also to accord in as many respects as possible with the organization of our European allies. The new organization increased the ratio of artillery and machine gun strength to infantry. In place of the old division of three brigades with three infantry regiments in each, there was a division of two brigades with two infantry regiments in each. The strength of the infantry regiments was increased from about 1,000 men to 3,652 men, with 103 officers.

From April 6, 1917 to November 11, 1918, about 4,000,000 men served in the army of the United States. About half a million came in through the Regular Army, and about 400,000 more through the National Guard. More than three-fourths of all came in through the selective service or National Army enlistments. Of every 100 men serving during the war, ten were National Guardsmen, 13 were Regulars, and 77 belonged to the National Army, or would have belonged if the services had not been consolidated and distinctions wiped out on August 7, 1918. About 200,000 commissioned officers were required for the army. Of this number less than 9000 were in the Federal service at the beginning of the war.

The number of American soldiers who reached France was 2,084,000 and of these 1,390,000 saw active service in the front line. The total number of divisions reaching France was 42, each composed of 28,000 men. Of these 29 took part in active combat service. American troops saw service on practically every part of the western front from British lines in Belgium to inactive sectors in the Vosges. They participated in 13 major operations, one of which, the Battle of St. Mihiel, was fought almost entirely with the American army. In this battle 550,000 Americans were engaged and in the Meuse-Argonne battle, 1,200,000 American troops were engaged.

The total of the casualties suffered by the American troops in the War of the Nations was 302,612. Of these, 34,248 were killed in action and 23,480 died of wounds, a total of 57,688. The wounded numbered 221,050; the missing in action 5 and the prisoners taken by the Germans, 4432.

The total expenditures directly attributable to the War of the Nations on account of the army was \$14,244,061,000.

The details of the transportation of these armies and of their return to the United States following the war will be found in the articles mentioned above.

NATIONAL DEFENSE ACT

Under the Act signed June 3, 1916 a great increase, accompanied by many changes, was authorized. Under this Act, the army of the United States "consists of the Regular Army, the Volunteer Army, the Officers' Reserve Corps, the Enlisted Reserve Corps, the National Guard while in the service of the United States, and such other forces as are now or may hereafter be authorized by law." The Regular Army, inclusive of existing organizations, thus consists of 64 regiments of infantry, exclusive of the Porto Rican Regiment; 25 of cavalry; 21 of field artillery; a coast artillery corps; of the staff corps and department; of the military academy; and of various other units and subsidiary organizations. The increases contemplated were to be made in five yearly increments, beginning July 1, 1916. The number of general officers was increased by 4 major and 19 brigadier generals. The general staff, increased to 55, had its functions severely limited by the law. Increases were made in the other staff corps, and to the engineers were given 7 regiments and 2 mounted battalions. The medical corps was to consist of 7 officers for every 1000 of enlisted strength. In the signal corps was authorized an aviation section to consist of 148 officers, 114 being first lieutenants, selected from the army at large. The coast artillery was increased to about 30,000 men, and the composition of brigades, divisions, and so forth, was set forth. The infantry regiment was to consist of 5 field and 46 subaltern officers, and of one headquarters company, one machine-gun company, and 12 infantry companies, these to be grouped into 3 battalions of 4 companies each. A similar organization was provided for the cavalry regiment, 14 troops, of which 12 were to form 3 squadrons of 4 troops each. The number of batteries in a field artillery regiment was not fixed, but the total number in this arm was to be 126, and each regiment was to have such number of gun and howitzer battalions "as the President may direct." To provide for various

details, the line of the army was increased by 822 extra officers of infantry, cavalry, field and coast artillery. The composition of the Regular Army Reserve was fixed, and conditions of service and pay laid down; a reserve corps of officers was created, not subject to call for service in time of peace, the Medical Reserve Corps abolished, and an Enlisted Reserve Corps created, to furnish men to the engineer, ordnance, medical, and other departments of the army. By the provisions of the law relating to the National Guard, the number of enlisted men of this force was ultimately to reach the ratio of not fewer than 800 men for each Senator and Representative in Congress, with a period of enlistment of 6 years, 3 with the colors and 3 with the reserve. Moreover, an oath of enlistment was provided, under which each affiant bound himself to obey the orders of the President and of the Governor of the State, etc. A similar oath, a "federal" oath, was to be required of officers. These and other provisions had for their object the federalization of the National Guard, so as to make of it a Federal as well as a State force. This feature is further emphasized by the admission of officers and men to the national payrolls.

Following the peace with the Central Powers, in 1919, steps were taken as soon as possible to reduce the strength of the military establishment. The Army of Occupation which formed a part of the Allied garrison of German territory remained at Coblenz until 1921, when the greater part was returned to the United States, leaving only a small nominal garrison of several thousand.

On June 4, 1920, Congress passed an act amending the so-called National Defense Act of June 3, 1916. This measure practically reorganized the regular military establishment of the National Guard. It divided the United States for military purposes into corps areas on the basis of military population. Each area has at least one division of the National Guard or organized reserves. There are nine of these corps areas. The act also established an Air Service, a Finance Department, and a Chemical Warfare Service, and it declared that "The organized peace establishment, including the Regular Army, the National Guard, and the organized reserves shall include all of those divisions and other military organizations necessary to form the basis for a complete and immediate mobilization for the National defense in the event of a National emergency declared by Congress."

A General Staff Corps was organized by this act, which consists of the Chief of Staff, the War Department General Staff, and the General Staff of the Troops. The office of Assistant Secretary of War was created with the general duty of supervising the procurement of all military supplies. Provision was also made for an Officers' Reserve Corps and for training camps under the direction of officers of the Regular Army. The provisions of former laws relating to the National Guard were somewhat altered. The Militia Division of the War Department became the Militia Bureau, with a chief to be chosen from the National Guard to hold office for four years. He is to be assisted by as many regular army officers and men as the President deems necessary. In accordance with this law, the army of the United States is now composed of three coordinate components; the Regular Army, the National Guard,

and the National Reserves. The act provided for a Regular Army of approximately 280,000 men and 17,700 officers. Congress, however, refused to make provision for an army of this size, and in 1922 an Army and Navy Bill carried appropriations for about 150,000 men. It was necessary, therefore, to reduce the army during that year to this number.

The actual strength of the military forces of the United States at the beginning of 1922 was as follows:

	OFFICERS	MEN
Regular Army	15,000	138,000
National Army	6,700	128,500
Organized Reserves	64,300	261

The militia numbered about 129,000 enlisted men and about 7000 officers.

NAVY

Naval History. The first definite provision for a naval establishment was the Act of Congress of Oct. 13, 1775, which authorized the building of one vessel of 10 guns and another of 14 guns to be equipped as national cruisers. At the same time a law was passed establishing a marine committee, consisting of John Adams (later replaced by Christopher Gadsden), John Langdon, and Silas Deane. This congressional committee was later enlarged to 13 and given charge of all matters pertaining to the navy.

On October 30 two more vessels were authorized, one of 20 and the other of 36 guns; while on December 13 the construction of 13 ships was provided for. On November 10 an Act for the "public defense" authorized the raising of 2 battalions of marines and established rules for the "government of the American navy." The marines authorized were in reality sailors, for the Act provided "that particular care be taken that no persons be appointed to offices, or enlisted into said battalions, but such as are good seamen, or so acquainted with maritime affairs as to be able to serve to advantage by sea when required." It is probable, therefore, that Congress designed by the Act to provide crews for such vessels as they were able to equip and to enlist and keep the men together until their services could be made available.

As the vessels authorized to be built could not be completed for some time, a number of merchantmen were purchased and armed. These improvised men-of-war, hastily and poorly equipped and armed and in many cases very badly officered and manned, constituted the first American naval force, of which, by Act of Congress of Dec. 22, 1775, Esek Hopkins was made commander in chief.

The vessels of the improvised navy were directed to cruise along the coast and intercept transports laden with munitions of war for the British army and navy. In March, 1776, in command of a small squadron which included nearly all the vessels as yet in service and consisted of the *Alfred* (24 guns), *Columbus* (20), *Cabot* (14), *Andrea Doria* (14), *Providence* (12), and *Wasp* (8), Hopkins captured the British naval station at Nassau, Bahamas, obtaining a quantity of military and naval stores, including nearly 100 cannon, which were much needed for the new ships. The prisoners included the Royal Governor of the island.

On March 23, 1776, letters of marque and

reprisal were granted against Great Britain, and numerous privateers were fitted out. On June 25 a marine corps (q.v.) was established, consisting of 1 major, 9 captains, 10 first lieutenants, and 7 second lieutenants.

After the Declaration of Independence Congress began the building up of the navy with increased vigor, and on October 3 it ordered another frigate and two cutters, and on November 9 an Act was passed authorizing the construction of three 74-gun ships, five more frigates, a sloop-of-war, and a packet; and these were to be supplemented by another frigate and another sloop-of-war ordered in January, 1777. But the plans of Congress were quite beyond the capacity of the Colonies to carry out. One 74-gun ship was laid down at Portsmouth, N. H., and completed in 1781—too late to be of service. Her armament was reduced to 56 guns, and during the next year she was presented to the King of France to replace the 74-gun ship *Magnifique*, which was lost in Boston harbor. Many of the vessels built never got to sea, and the real work performed by the navy during the Revolution was done by a dozen vessels, most of which were small.

On Nov. 15, 1776, Congress established the relative rank between officers of the army and navy as follows: admirals to rank with generals, vice admirals with lieutenant generals, rear admirals with major generals, commodores with brigadier generals, captains of ships of 40 guns and upward with colonels, captains of ships of 20 to 40 guns with lieutenant colonels, captains of ships of 10 to 20 guns with majors, lieutenants with captains, and officers of marines with officers holding similar commissions in the land service. Notwithstanding this act, no rank higher than that of captain was created by law until 1862, though the title of admiral (q.v.) was given to John Paul Jones in the official correspondence of the State Department in 1792, a short time previous to his death.

From the close of the Revolution until 1795 the country was practically without a navy, largely from lack of money to support one. The cause of its reestablishment was the depredations of the Barbary pirates. On March 3, 1794, President Washington sent a message to Congress communicating the facts in regard to the Algerian outrages, and Congress promptly passed an Act, which was approved on March 27, authorizing the purchase or construction of six frigates. It was provided that no vessel should mount less than 32 guns. An additional provision was that all proceedings under the Act should cease in case the Algerian difficulty should be settled. Measures were immediately taken for the construction of the vessels, which consisted of the *Constitution* (q.v.), *President*, and *United States* of 44 guns, and the *Chesapeake* (q.v.), *Constellation*, and *Congress* of 38.

In November, 1795, a treaty was signed with the Dey of Algiers, and all work on the vessels was suspended. The President immediately called the attention of Congress to the subject, and an Act was passed without delay ordering the completion and equipment of two of the 44's and one of the 38's. The treaty of peace with the Dey of Algiers cost nearly a million dollars, the price of three frigates, and the President, in his annual address to Congress in December, 1796, strongly recommended laws for the gradual increase of the navy. The outrageous proceedings of the French cruisers on the United

States coast did what no representations of the government could achieve, and in April, 1798, Congress grudgingly authorized the President to build, purchase, or hire 12 vessels, none of which was to exceed 22 guns, and see that they were regularly manned and equipped. This Act was passed on April 27, and on the 30th a regular Navy Department was created separate from the Department of War, of which it had previously formed a part. Benjamin Stoddert of Georgetown, D. C., was the first Secretary and he entered on his duties in June. On June 11 a new marine corps was established, and during the year a number of additional small vessels were authorized.

The quasi war with France soon terminated with credit to the newly born service; nevertheless Congress was so opposed to any form of preparedness and so imbued with false ideas of economy that the navy would have been reduced to comparative uselessness had not the Barbary Powers repeated their acts of aggression. The Act of 1801 greatly reduced the personnel, and somewhat more than half the ships were sold. The operations of the Tripolitan War were highly creditable to the navy and greatly raised its esprit du corps and efficiency. Nevertheless it underwent another reduction at the hands of Congress. All but one or two of the larger vessels were laid up, and the few officers and men retained were mostly employed in small worthless gunboats. Whether President Jefferson or Congress devised the gunboat policy is uncertain, but both were earnest advocates of it. While this system was being developed the incident of the *Chesapeake* and *Leopard* occurred and saved the navy from complete demoralization, though the incident itself was discreditable both to the country and to the naval service. Neither the aggressions of England and France and the murder or imprisonment of thousands of American citizens nor the danger of war with Spain could rouse Congress to a sense of duty, to prepare to resist the outrages which were daily growing worse. The whole government seemed to have adopted a policy of hopeful waiting, the President confining his efforts of resistance to feeble diplomatic protests ending in the disastrous embargo which inflicted a damage of one hundred millions upon the merchant marine and commerce, while Congress did nothing except to squander the price of several line-of-battle ships in building 257 gunboats. Finally, in January, 1809, a bill was passed by which the navy was more than quadrupled in personnel and four of the larger vessels put in commission. But still no battleships were ordered until after the brilliant victories of the *Constitution* and *United States* had roused popular enthusiasm. It was then too late to complete them before the war closed. Opposed to this pitiful showing, Great Britain had 1060 vessels. Notwithstanding this disparity in force, the United States navy achieved worldwide renown and won the respect of the country. In 1815, shortly after the close of the war, the navy was reinforced by three ships of the line of 74 guns, the *Independence*, *Franklin*, and *Washington*; two frigates of 44 guns, the *Guerrière* and *Java*; and the steam man-of-war *Demologos*.

Immediately after the close of the war with Great Britain a squadron under the command of Commodore Decatur was sent to punish the Barbary powers, particularly Algiers, for wanton

aggressions upon United States commerce during the war, which prevented action being taken at the time. In 60 days after his arrival in the Mediterranean Decatur had captured the principal vessels of the Algerian navy and had forced treaties on Algiers and Tunis which compelled these faithless pirates to a recognition of maritime right.

In considering the operations of the War of 1812 it is interesting to speculate upon what might have occurred had the war lasted another

THE DEMOLOGOS.

year. In 1813 Robert Fulton submitted to President Madison plans for a sea-going steam battery. His plans were accepted, and in March, 1814, Congress authorized the building of one or more of such batteries for the defense of the coast. Fulton died in February, 1815 but the *Demologos* (voice of the people) was completed in the following spring and had successful trials in June. On July 4, 1815, she made a trip to sea and back, steaming 53 miles in 8 hours and 20 minutes. Her length was 156 feet, beam 56 feet, depth 20 feet, and she measured 2475 tons, or more than a line-of-battle ship and 1000 tons more than the *Constitution*, although her cost (\$320,000) was only \$17,000 more than the first cost of the latter. Her sides were 5 feet thick and impenetrable to any guns carried by British ships, while her battery consisted of 20 guns, which were heavier than any then afloat. A furnace was fitted for heating shot, and there were pumps, for throwing cold or hot water on the enemy's deck. The propelling apparatus of the *Demologos* consisted of a single paddle wheel in the centre of the ship, operating in a channel extending the length of the ship below the gun deck and dividing the underwater body into two parts, which were held together by the upper works and transverse frames at the bottom. Had this vessel got to sea before the conclusion of hostilities and met the warships of

the enemy, it is tolerably certain that she would have destroyed the heaviest squadrons with ease and caused a revolution in naval affairs. As it was, however, her powers remained unproved, and the natural conservatism of the naval authorities, accustomed to the use of sails, caused her to be looked upon as an interesting experiment of no great practical value. She was therefore tied up alongside the wharf at the Brooklyn Navy Yard and used as a receiving ship. On June 4, 1829, her magazine blew up, killing 24 persons and injuring 19.

The successful performance of the *Demologos* (or *Fulton*, as she was afterward called in honor of her designer) led Congress in 1816 to authorize the construction of another steam battery. But the conservative officers at the head of affairs in the navy could not understand the importance of steam-propelled ships, and it was not until 1835 that measures were taken to carry out the provisions of the law. In the meantime a number of ships of the line were commenced, 10 in all, and some of them took part later in the Mexican War. In 1835 the Secretary of the Navy, acting upon better advice, directed the Board of Commissioners to proceed at once to the construction of a steam man-of-war. In 1837 it (the *Fulton*) was completed and tried, a speed of 12 knots being realized. The propelling power consisted of side paddle wheels and engines on the upper deck. Several other paddle-wheel vessels were built in the next few years, one of which was the iron steamer *Michigan*, which is still on the navy list—the first iron vessel in the navy and also the first one afloat on the Lakes. In 1842-43 the screw steamer *Princeton* (of about 1000 tons) was built and fitted with machinery designed by John Ericsson. She was the first war vessel in any navy to be fitted with screw propulsion, and likewise the first to have all her machinery and boilers below the water line and to have blowing fans for forcing the draft under the boilers. A congressional committee, after considering the advantages of the submerged propeller and iron hulls recommended in 1846 that 13 screw steamers of iron be immediately constructed. When authority for the construction of four war steamers was granted in the following year, a board of prominent naval officers recommended that three of the four should have paddle wheels. The fourth was the *San Jacinto*, and it as well as the others was built of wood. In 1854 Congress ordered the building of "six first-class steam frigates to be provided with screw propellers." These vessels were the celebrated ships of the *Merrimac*, *Niagara*, and *Wabash* class. They were of fine model for their day and should have had good speed, but instead of having full steam and auxiliary sail power they had full sail power and only auxiliary engines. They were followed, however, in 1857 by the steam frigates of the *Hartford* class, in which the engine power was relatively considerably increased.

The operations of the navy in the Civil War soon showed the true importance of steam and the uselessness, or worse than uselessness, of sails. Even after the close of the war the practice of giving full sail power to cruising men-of-war was continued from mistaken ideas of economy, though during the war the rigged ships had been generally stripped of yards and upper masts. The practice died hard, and it was not until 1887 that a full-sail rig was abandoned for cruising vessels. The ill-fated

Maine was the last ship for general service to be designed to carry a heavy square rig, but this was changed to military masts before her completion.

The importance of possessing armored vessels was realized as soon as the Civil War commenced, and on both sides an investigation of the subject of armored ships was begun at once. The Confederates started work first, but the superior resources of the North enabled the first really armored ships to be completed on practically the same day. Both *Monitor* and *Merrimac* (Virginia) were fatally defective in details, but many of the defects were corrected in later vessels of the same types. See SHIP, ARMORED.

After the close of the Civil War the navy again sank into decadence, the enormous expenses entailed by the war causing Congress to cut down appropriation in every direction. The personnel of the regular service was increased just after the end of the struggle, but it was cut down later, the last cut being in 1892, just as new construction was about to commence. During the interval 1866-82 only a few vessels were authorized—five monitors of 4000 to 6000 tons and about a dozen wooden cruisers, only one of which (the *Trenton*) was over 2000 tons. Old vessels were repaired and kept going, but nothing new was attempted, the wooden cruisers mentioned being out of date when put in service. So that, in 1880, the United States navy, with its antiquated ships and no less antiquated ordnance, was the laughingstock of the world and in power below that of several of the small republics of South America. Finally, in 1881, a board was appointed by the Secretary of the Navy to consider the needs of the service. This board recommended the building of 68 vessels of various types.

Congress appropriated for two and at its next session increased the number to four, but reduced the size. The first of these Acts was passed Aug. 5, 1882, and in addition to the provision for the two ships made a sweeping cut in the number of officers, which blocked promotion for 10 years and subsequently caused endless trouble through the deficiencies in the numbers produced by it. Five monitors were started early in the seventies, but work on them had long since ceased when it was revived by the Act of 1882 which appropriated \$400,000 towards their completion. In the next session \$1,000,000 additional was appropriated, but the succeeding Congress withdrew all unexpended balances of this. From this time on each Congress made some addition to the navy. In 1886 the *Maine* and *Texas* were provided for and in 1890 three battleships of the *Oregon* type. In deference to the very general prejudice which existed against the high-sided, broadside battleships of European navies, these ships were given rather low freeboard and were called coast-line battleships. But the *Iowa*, which was next built, was frankly described as a seagoing battleship, the unreasonable prejudice in favor of the nearly useless low freeboard monitor having been much modified.

The war with Spain caused increased attention to be given to naval affairs, not only because the navy had done well, but because the people were beginning to appreciate the importance of a powerful navy to a country which must be attacked from the sea and reach its enemies through its naval strength. They learned not only this, but that true naval defense lies not in passive protection of harbors by forts and harbor-defense

ships, but in pursuing the enemy's naval forces at sea and destroying them. The realization of these things caused the navy to be considerably expanded; more heavy battleships, armored cruisers, and torpedo boats were authorized; and the enlisted force, which had been nearly doubled since 1882, was now greatly increased. In 1899, for the first time in nearly 20 years, Congress passed legislation of importance concerning the officers. Nearly all corps were slightly increased, and the line and engineer corps were combined. This was practicable, as nearly all officers of both corps had been educated at the Naval Academy, and, while the line officers had received considerable instruction in steam engineering, the engineers had received some training in line officers' duties. After 17 years of experience the amalgamation of the two corps is regarded as highly successful and as adding greatly to the efficiency of the navy. Officers electing to perform special duties are selected for additional courses in their work—ordnance, marine engineering, electrical engineering, aviation, etc. The senior officers performing duties in these branches are, as far as practicable, selected from those who have been specially educated for the work.

WAR OF THE NATIONS AND AFTER

The work of the United States Navy in the War of the Nations was more important and decisive than is generally understood. Without its powerful assistance the submarine could not have been so effectively curbed; American troops could not have been sent to France without great losses, and the food supplies for the Allies might have failed. The American navy furnished the additional force which made the British blockade and the anti-submarine war a complete success. For more than a year one division of the United States battleship fleet formed part of the British Grand Fleet, and for a shorter period two American divisions were so operating. Their business made it possible for British battleship units to receive the necessary overhaul without reducing the available forces to a point which might give the German fleet opportunity to come out without being destroyed.

The navy was well prepared for its entrance into the war. Within a month after the declaration, April 6, 1917, nearly all the larger American destroyers had crossed the Atlantic and were operating in European waters. Patrol boats of all types, mine-layers, and mine-sweepers were dispatched as rapidly as they could be equipped and new destroyers were laid down as fast as the building quays could be prepared or cleared for them. More than 250 new destroyers were built during 1917-18. From the declaration of war, April 6, 1917, to April 6, 1918, 1275 vessels, aggregating 1,055,116 tons were added to the navy through building or purchase. One of the great exploits of the war was the laying of the mine barrage in the North Sea by American naval vessels. The details of the operations of the navy during the war are to be found in the article NAVY and SUPPLEMENT.

Following the conclusion of the War of the Nations, there was a desire to cut down the enormous expenses under which the governments were laboring, and as the most direct method of doing this. President Harding invited Great

Britain, France, Italy, and Japan to meet in conference in Washington to consider, among other questions, that of the limitation of naval armaments. The deliberations and results of this conference are told in SUPPLEMENT. As regards the United States Navy, the agreement was reached that it should be equal to the British navy and superior to the Japanese navy in a ratio of 5-5-3. The United States engaged, under the terms of the agreement, to scrap all new capital ships now under construction and on their way to completion. This included 6 battle cruisers and 7 battleships on the ways and building, and two battleships launched. It agreed also to scrap all battleships up to but not including the *Delaware* and *North Dakota*. By an amendment, the battleships *Colorado* and *Washington* were allowed in place of the *Delaware* and *North Dakota*, which were to be scrapped. It was agreed that no other new capital ships should be constructed during the period of the agreement, except replacement tonnage as provided elsewhere in the agreement. By the terms of this agreement the capital ships of the United States will include the *Maryland*, the *California*, *Tennessee*, *Idaho*, *Mississippi*, *New Mexico*, *Arizona*, *Pennsylvania*, *Oklahoma*, *Nevada*, *Texas*, *New York*, *Arkansas*, *Wyoming*, *Utah*, *Florida*, *Colorado*, and *Washington*, or a total of 18 ships with a tonnage of 525,850. The agreement also provided for the construction of smaller craft, including airplane carriers.

The Naval Appropriation Act for 1921-22 authorized a total expenditure of \$413,067,039 and fixed the personnel of the navy at 106,000. The effective force of the navy on January 1, 1922 consisted of 18 dreadnought battleships of 500,650 tons; 15 pre-dreadnought battleships of 227,740 tons; 12 armored cruisers of 148,715 tons; 11 old protective cruisers of 44,087 tons; 3 scout cruisers of 3750 tons; 4 gunboats of 5170 tons; 278 destroyers of about 300,000 tons; a large number of submarines of about 80,000 tons. The following table shows the battleships and battle cruisers under construction during 1922.

VESSELS UNDER CONSTRUCTION FOR UNITED STATES NAVY

Per Cent Complete Nov. 1, 1921

TYPE AND NAME	Displacement (tons)	Per cent complete
Battleships:		
<i>Colorado</i>	32,600	83.0
<i>Washington</i>	32,600	69.8
<i>West Virginia</i>	32,600	64.0
<i>South Dakota</i>	43,200	35.2
<i>Indiana</i>	43,200	33.2
<i>Montana</i>	43,200	27.6
<i>North Carolina</i>	43,200	36.7
<i>Iowa</i>	43,200	29.9
<i>Massachusetts</i>	43,200	10.4
Battle cruisers:		
<i>Lexington</i>	43,500	26.7
<i>Constellation</i>	43,500	15.5
<i>Saratoga</i>	43,500	29.4
<i>Ranger</i>	43,500	2.9
<i>Constitution</i>	43,500	11.7
<i>United States</i>	43,500	11.1

The number and tonnage of each class of the less important vessels (built and building) will be found in the table under NAVIES.

TICS; NAVAL RESERVE; NAVAL SCHOOLS OF INSTRUCTION; NAVIES; NAVY, DEPARTMENT OF THE; NAVY YARD; PAY AND ALLOWANCES; SHIP AND SHIPPING; SHIP, ARMORED.

Colonies. The following figures for area and population are based upon the census of 1920 and government estimates.

COLONIES	Area	Population
Hawaii.....	6,449	255,912
Philippine Islands (1918).....	115,026	10,314,310
Porto Rico.....	3,435	1,299,809
Guam (est.).....	210	13,275
American Samoa.....	77	8,056
Panama Canal Zone (est.).....	527	22,853
Virgin Islands (1917).....	132	26,051
Total for the colonies.....	125,856	11,805,307

For details on commerce, government, history, etc., see HAWAII; PHILIPPINE ISLANDS; PORTO RICO; ETC.

POPULATION

The population of the United States has grown from 3,929,214 in 1790 to over 105,000,000 in 1920. It constitutes over one-half that of the Western Hemisphere and greatly exceeds that of any European country except Russia. The rapidity of the growth of the population is without parallel among civilized nations. In 1920 it was over 20 times as great as in 1800. During the same period the population of the United Kingdom and Germany increased about one and one-half times each, while that of France increased by less than half. The growth of the population also has been remarkably steady. Except in the war decade (1860-70), the increase in each decade since 1790 has been greater than in the decade preceding.

An examination of the composition and characteristics of the population by divisions and States in 1920 reveals some interesting figures. In the New England division the total male population is 3,672,591 and the female population 3,729,318; in the Middle Atlantic division the male population is 11,206,445 and the female 11,054,699; in the East North Central division the male population is 11,035,041 and the female 10,440,502; in the West North Central division the male population is 6,459,067 and the female 6,085,482; in the South Atlantic division the male population is 7,035,843 and the female population 6,945,429; in the East South Central division the male population is 4,471,690 and the female 4,421,617; in the West Central division the male population is 5,625,829 and the female 4,976,395; in the mountain division the male population is 1,789,209 and the female 1,546,802; in the Pacific division the male population is 2,964,626 and the female 2,206,245.

The number of dwellings in the New England division was 1,255,904 with 1,703,812 families; in the Middle Atlantic, 3,566,549 dwellings with 5,085,080 families; in the East North Central, 4,385,541 dwellings with 5,143,903 families; in the West North Central, 2,716,968 dwellings with 2,957,849 families; in the South Atlantic, 2,781,684 dwellings with 2,991,628 families; in the East South Central, 1,876,167 dwellings with 1,967,381 families; in the West South Central, 2,110,879 dwellings with 2,242,810 families; in

the mountain division, 743,775 dwellings with 803,853 families; in the Pacific division, 1,268,677 dwellings with 1,445,350 families. In the entire United States there were 20,697,204 dwellings with 24,351,676 families.

The North has, until recent years, grown much more rapidly in population than the South. The more rapid growth of the South in the last decade was largely due to the development in the Southwest. The gain in the region east of the Mississippi has been remarkably regular. The percentage of gain west of the Mississippi was formerly enormous, but is rapidly falling to that of the region east of the Mississippi.

Estimates of the population prior to the first regular census place the figure at 200,000 in 1688 and 1,850,000 in 1770. At the time of the first census the population was almost wholly confined to the Atlantic coast region, the five most populous States being Virginia, Pennsylvania, North Carolina, Massachusetts, and New York, in the order named. The growth of the population has been due in a considerable degree to the additions by immigration.

Interstate Migration. In the early period of migration the direction of the movement was determined largely by the opportunities afforded by waterways and mountain passes and later by the railroad accommodations. The waterway system of the United States was admirably adapted to aid in the settlement, and the part it played is not easily overemphasized. Not only did many of the early settlers secure transportation to their new homes by rivers, but they used the rivers also as avenues of commerce, and new settlements almost universally began along watercourses. In the North the immigrants from New England and New York passed almost wholly through the Mohawk valley, and western New York developed rapidly along the line of the Erie Canal. By this route the Lake region and the Northwest in general were peopled. Farther to the south a large number of settlers found passage west by way of the valley of the Potomac and by the Ohio and its tributaries. The settlements made in the region tributary to the Ohio were first to the south and later to the north of that stream. In the Southeast the Savannah and other rivers in like manner aided in opening up the interior region. The influence of streams in the Mississippi valley was very marked. Through the main stream from the south, and through the Ohio from the east, large numbers of immigrants passed to the centre of the valley and thus were enabled to reach other regions watered by the Mississippi system, until settlements lined the main and tributary streams. The railroads came at an opportune time and made possible and profitable the settlement of regions that would otherwise have remained unsettled for a much longer time. The gold discoveries in California drew large numbers of immigrants in spite of the difficulties of the route, but, generally speaking, the Pacific coast and the Cordilleran region awaited the construction of railroads. The movement of the population in the United States has been in the main westward, following the parallels of latitude. Almost every newly settled region, however, received representatives from all parts of the older settled regions, and there are a few very marked north and south movements. Thus, e. g., southern and central Indiana were filled largely with immigrants from North Carolina, Kentucky, and other Southern States. The early

lead miners and settlers in the adjacent corners of Wisconsin and Illinois on the Mississippi were Southerners. The recently settled Oklahoma and Indian Territory received large numbers from both the North and the South.

Negro Population. See NEGRO IN AMERICA.
Urban Population. Since 1875 there has de-

veloped a marked tendency for the population of the United States to congregate in cities. Better transportation and communication facilities have enabled trade to concentrate in the large centres, and the development of an extensive factory system has also tended in the same direction.

* 1890 figures include Indians in the Indian Territory, but not those on other reservations.

† 1900 figures do not include 91,219 persons in military and naval service.

‡ Figures include about 56,000 persons in military and naval service abroad.

In New Jersey and Pennsylvania the Quaker element, although early abdicating political control, continued to be the leading social factor.

Throughout the Colonial period the Congregational churches exercised almost undisputed religious sway in New England, while members of the Established church nominally did the same for the Southern Colonies. In the Middle Colonies no one sect acquired a hegemony. Here the diversified English sects were quickly joined by Huguenots from France, Palatines, Salzburgers, and Moravians from Germany, Covenanters from Scotland, and the Scotch-Irish Presbyterians. To a much more limited extent many of these immigrants settled in the Carolinas and Georgia, but their chief irruption into the South was by the way of the Appalachian highlands. In this early sectarian diversity the Middle Colonies, more than those of any other section, were most typical of the succeeding development of the whole country. During the first century and a quarter of settlement there was naturally little of common religious experiences in the Colonies. Some conscientious attempts were made to convert the Indians, of which the most important was the work of the President and Society for the Propagation of the Gospel in New England. The Society for the Propagation of the Gospel in Foreign Parts, a Church of England organization, founded in 1701, did an important work in the Middle and Southern Colonies. The most important religious experience of the eighteenth century was the Great Awakening, centring about 1740, which profoundly affected all of the Colonies, led to an extension of church building, the founding of Princeton College as the result of a great Presbyterian development in the Middle Colonies, and the firm establishment of Baptist preëminence in the South. Because of some unwise practices not wholly avoidable, dissensions were introduced among the existing sects, yet the movement as a whole was most beneficial, not merely because it stamped upon American church life a strong evangelistic and missionary character, but because it led the way to the later establishment of full religious toleration. The later part of the Colonial period was characterized by the rapid development of Presbyterianism, the formal establishment of the Reformed and Lutheran churches among the Germans, and the beginning of Methodism—all within the Middle and Southern Colonies. See CONGREGATIONALISM.

The National Period.—The Revolutionary War, although it ushered in an era of complete religious toleration, so far as State and nation were concerned, was not on the whole favorable to the development of the religious life of the newly created States. At the end of the century, when spiritual conditions were at their lowest ebb, the country experienced a second great revival, which if it lacked some of the fervid manifestations of the first, was much more productive of lasting results. As in the former case there came about a secession of some of the more radical elements from the existing denominations in the Middle States and the South, and the severance of the Unitarians and Universalists from the Congregational church in New England. Yet in the main the first three decades of the nineteenth century may be termed the era of good feeling in a religious as well as a political sense. It was a period of great

catholicity among the various denominations, with coöperation in foreign and home missionary work, in educational advancement, and in the work of Bible distribution. This was the period also when the Episcopal and Catholic churches began to develop along American lines and to assume an important position among American denominations; the latter being recruited most largely from foreign immigration, and the former from the other denominations. The great missionary movement towards foreign lands, the home missionary movement along the Western national border, the building of theological seminaries, the work among the negroes and Indians, protests against slavery, and the first movements in favor of total abstinence also date from this period. Early in the nineteenth century the connection between church and state in New England was completely severed.

The next 30 years (1830-60) were characterized by a more intense denominational alignment, showing itself in a withdrawal of the separate churches from organizations for united effort and in the creation of various denominational boards to carry on this work; in a new zeal for Church history along sectarian lines; in a general Protestant antipathy to the Roman Catholic church, which even displayed itself in the political world (see KNOW-NOTHING), and in the division of some of the great denominations along sectional lines, especially over the great slavery question. The religious element was especially helpful on both sides during the Civil War and was much in evidence in the organization of associations for the care of soldiers at the front and also at the North for the education of the freedmen.

An important revival just preceding the Civil War had stirred deeply the evangelical sentiment of all the churches, and this was quickened by a succeeding revival between 1870 and 1880. The influence of these movements has been to increase a sincere and hearty coöperation of

all denominations in fundamental religious work. There has been a distinct advance in essential Christian union expressed in the federation of a

large number of the Protestant denominations. This tendency has been much strengthened by such organizations as the Evangelical Association, the Young Men's Christian Association, and the various young people's organizations. (See CHRISTIAN ENDEAVOR; EPWORTH LEAGUE; YOUNG MEN'S CHRISTIAN ASSOCIATION.) An interesting feature of the religious development of the last half century has been the growth of certain nonorthodox sects. In addition to the list of denominations found in the table on page 740, there are many other religious bodies in the United States. One of the most interesting of these is the Armenian Church, which was established in 1889 in Massachusetts, by an Armenian priest who was sent to minister to a few hundred Armenians. The rapid influx of the Armenians following the atrocities in Asia Minor, led to a large increase among the members of this race in the United States, and the denomination grew in numbers and strength. In 1916 there were 27,450 communicants and 34 organizations. All these organizations used the Armenian language only. The priests numbered 17. The doctrinal system of the Armenian Church is founded on the Nicene creed, without the addition made by the Western Church in regard to the Procession of the Holy Ghost from the Son as well as from the Father. Among the other smaller denominations are the Bahais, a Persian cult, founded in 1844 in Shiraz, by Ali Mohammed, who declared himself to be the babe or forerunner of the Promised Divine One. There were in 1916 2,844 members of this sect, with 57 organizations. Other denominations are the Christadelphians, with 2,922 members and 142 organizations; and the Christian and Missionary Alliance, with about 10,000 members; the Pillar of Fire, formerly the Pentecostal Union Church with 1,129 members and 21 organizations; the Hutterian Brethren, formerly Brüderhof Mennonite Church, with about 1,000 members and 17 organizations; the Non-Sectarian Churches of Bible Faith, with 2,753 members and 58 organizations; the Pentecostal Church of the Nazarene, with 32,259 members and 866 organizations; and the Pentecostal Holiness Church, with 5,353 members and 192 organizations. See CHRISTIAN SCIENCE; MORMONS; NEW THOUGHT.

Owing to the fact that church and state are entirely distinct in the United States, it is difficult to obtain accurate information concerning religious statistics. The only figures available are those derived from the annuals and yearbooks published by the several denominations. The table on page 740 presents figures for the principal denominations from the religious census taken in 1916 by the United States Bureau of the Census.

Education. This subject will be found fully under the following titles: COMMON SCHOOLS; CURRICULUM; EDUCATION; GRAMMAR SCHOOLS; KINDERGARTEN; MANUAL TRAINING; NATIONAL EDUCATION, SYSTEMS OF; NORMAL SCHOOLS; PAROCHIAL SCHOOLS; PEDAGOGY; PHYSICAL EDUCATION; PUBLIC SCHOOLS; SCHOOLS, MEDICAL INSPECTION OF; TEACHERS' PENSIONS; TEACHERS' SALARIES; EVENING SCHOOLS; VACATION SCHOOLS; HIGH SCHOOLS; ELECTIVE COURSES AND STUDIES; COLLEGES, AMERICAN; UNIVERSITY; UNIVERSITY EXTENSION; VOCATIONAL EDUCATION; EDUCATION, COMMERCIAL; TECHNICAL EDUCATION; LEGAL EDUCATION; MEDICAL EDUCATION; MENTAL DEFECTIVES;

BLIND, EDUCATION OF THE; DEAF-MUTE, *Methods of Instruction*; NEGRO EDUCATION; EDUCATION, COMMISSIONER OF; EDUCATION ASSOCIATION, NATIONAL; EDUCATION, COLONIAL.

The school census was taken by the census of January 1, 1920. The total population of persons 5 to 20 years of age inclusive, the school age in the United States, was 33,250,870. Of this number 21,373,976 had attended school at some time between December 1, 1919 and January 1, 1920. This was an increase of 5.1 per cent since 1910. The total population between 7 and 13 years of age numbered 15,306,793. Of these 90.6 per cent or 13,869,010 children were attending school. This was an increase of 4.5 per cent over the corresponding figures for 1910. Among the individual States, the largest proportion attending school in the 5 to 20 age group is shown by Utah with 73 per cent and the smallest by Louisiana with 53 per cent. For the 7 to 13 age group the largest proportion of school attendance, 96.1 per cent, is that for Massachusetts, and the smallest, 75.9, for Louisiana. Seven States show a percentage of 95 per cent or more. These are Massachusetts, Rhode Island, Ohio, Iowa, Delaware, Idaho and Utah. The New England division with 95.3 per cent ranks first; while the West South Central with 82.5 per cent ranks lowest.

The total attendance of universities and colleges in 1918 was 290,106. Of these 178,060 were in private colleges and 112,046 in public or State colleges. The registration for the years following the war, especially in 1921-2, greatly exceeded that of any other previous year. In the professional schools there were enrolled in 1918, 48,653 pupils and in the normal schools, 138,074. In business schools, both day and night, were enrolled 289,579 pupils, and in the Government Indian schools, 28,521. The total enrollment for all schools in the United States in 1918 was 24,027,199. The total number of teachers employed was 769,763, including 153,641 men and 616,122 women. The estimated value of all school property was \$1,983,508,818. Of this \$1,258,933,000 were for city school property and \$724,575,818 for rural school property. In all elementary and secondary schools the average annual salary for teachers was \$635. The Federal Board of Vocational Education coöperated with the States in the vocational training of 305,224 pupils, from July 1, 1920 to June 30, 1921. The pupils were divided among the different occupations as follows: agriculture, 42,709; trade or industry, 83,532; home economics, 63,806; and part time general continuation schools, 115,177.

Charities. The national government has no department concerned directly with charities, their control being in the hands of the State and municipal governments. Many private organizations and societies are also interested in the subject. See under the several State articles; also CHARITIES; PAUPERISM; CHARITIES AND CORRECTION, *The National Conference of*; CHARITY ORGANIZATION SOCIETY; ETC.

HISTORY

Colonial Period. The territory included within the United States of America was originally occupied solely by numerous tribes of Indians. The northeast coast was probably vis-

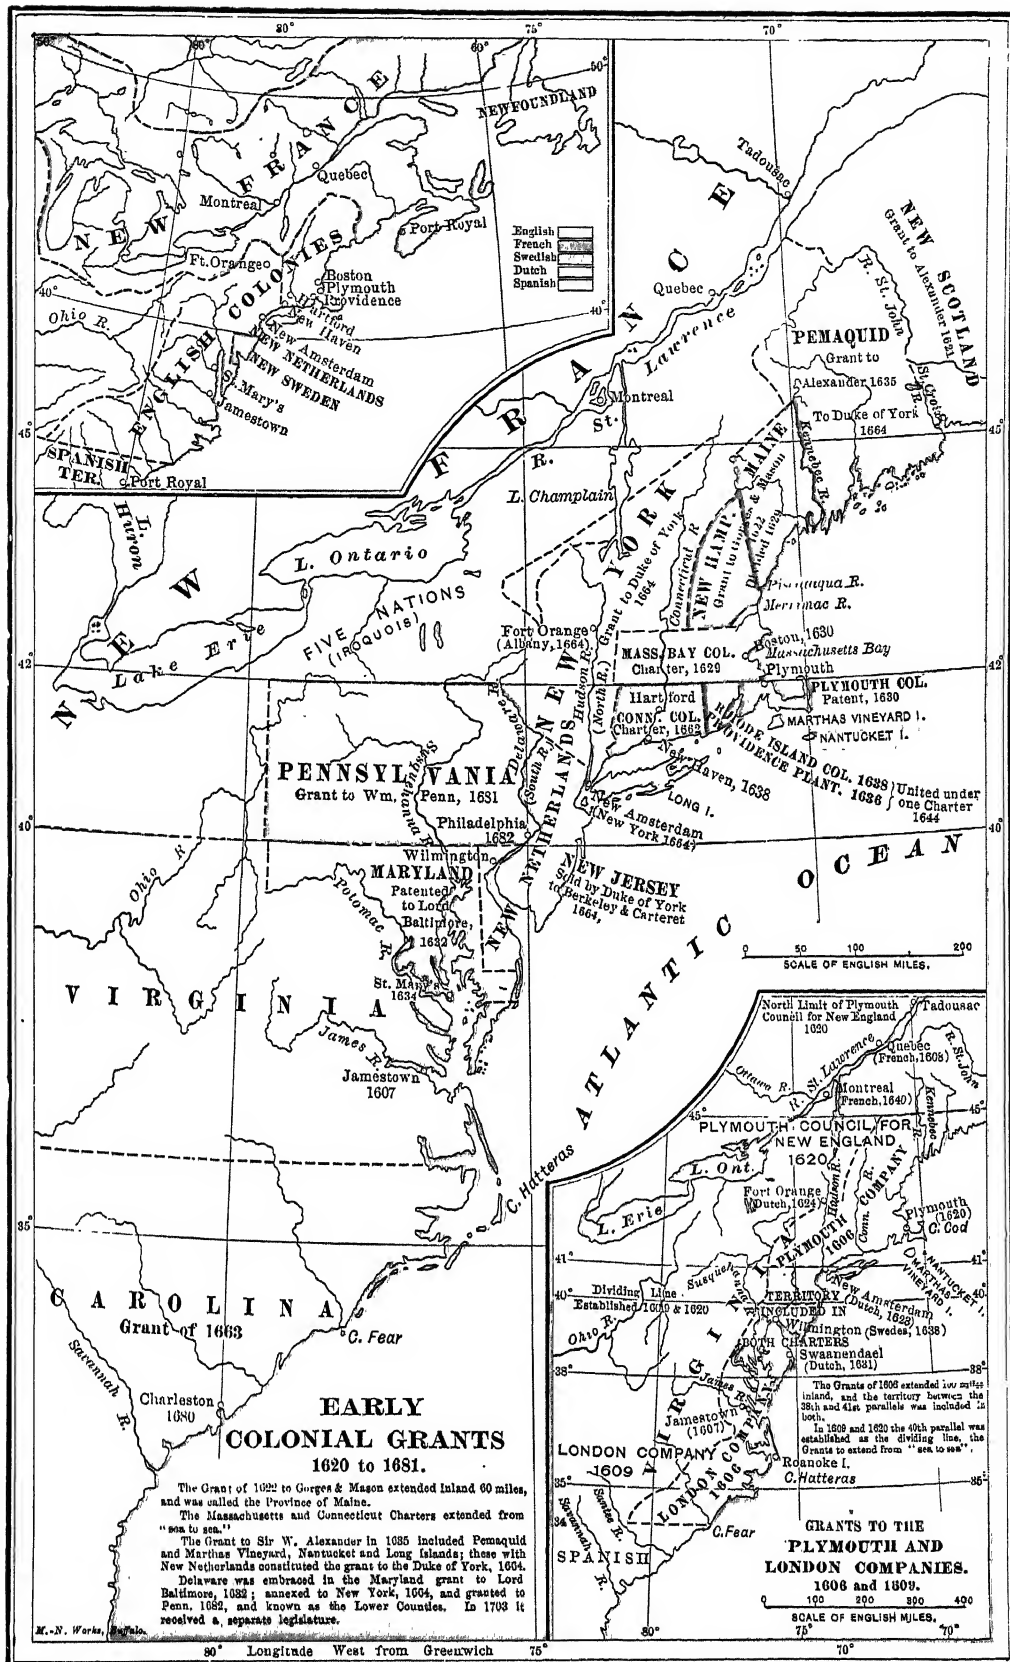

ited about the year 1000 A.D. and subsequently by the Northmen (see VINLAND), and other navigators may in the following five centuries have sighted parts of the coast; but the existence of the American continent was unknown to the world at large until after Columbus' discovery in 1492. In 1497 John Cabot reached the coast of America, probably in the neighborhood of Cape Breton. The Portuguese Cortereal explored the coast southward from the Gulf of St. Lawrence in 1500-01, and probably from as early a date as 1504 fishermen from Normandy and Brittany frequented the shores of Newfoundland. In 1513 Juan Ponce de León explored a portion of Florida in a romantic search for the fountain of youth; and in 1520 some Spanish vessels from Santo Domingo were driven upon the coast of Carolina. During the following year, through the conquests of Cortés (q.v.) and his followers, Mexico, including the territory later known as Texas, New Mexico, and California, became a province of Spain. In the same decade Verazano explored the coast between North Carolina and Newfoundland and Narváez made his disastrous expedition to Florida. Ferdinand de Soto in 1539-42 led a Spanish expedition from the coast of Florida westward, discovering the Mississippi River early in 1541. Simultaneously with this expedition Coronado's men explored a great part of what is now southwest United States. A Spanish settlement was made at St. Augustine, Fla., in 1565, and in 1585 Sir Walter Raleigh (q.v.) sent out a Colony which settled on Roanoke Island. None of the settlements attempted during the sixteenth century, however, except St. Augustine, had any permanence; and it was not until the seventeenth century that the Europeans, and especially the English, devoted their enterprises to colonization rather than to exploration. King James in 1606 granted a charter to two joint-stock companies, the London Company (q.v.) and the Plymouth Company (q.v.). The London Company in 1607 founded Jamestown, Va., the first permanent English settlement within the limits of the present United States. Here in 1619 a representative assembly was called, the first in the New World. In 1607, also, the Plymouth Company sent out an expedition to the Kennebec, where the settlers experienced a severe winter, and in 1608 abandoned the undertaking. In 1620 a body of Puritan Separatists who had secured a grant from the London Company landed by mistake farther northward and settled Plymouth. Between these two Colonies the Dutch had already established themselves (1613) at New Amsterdam. Quebec was settled in 1608, and a large part of the country on the Great Lakes and on the Mississippi was explored by Nicolet (1634), by Marquette and Joliet (1673), and by La Salle (1682), and settlements were early made by the French at the outposts of Kaskaskia and Arkansas Post and at Mobile and Vincennes. Thus the beginnings were made of two distinct movements of the incoming population, in the course of one of which the English were to occupy practically the entire Atlantic seaboard of the present United States, excluding Florida, while in the course of the other the French were to establish themselves at strategic points on the two great waterways. The colonizing work of the French was such as to make conspicuous the trading post, the military element, and the bureaucratic class, and to minimize the features of public development, of local political life, and

of permanence in method and purpose. The English, on the other hand, brought with them their school, their church, and their political forms, and founded Colonies on lines which were adhered to throughout their later development. (The early history of the various Colonies, the union of which formed the United States, will be found under the heads of the different States.) In some of the Colonies representative governments were maintained, in which all officers, both executive and judicial, as well as the entire Legislature, were chosen by the people. On the other hand, in the royal provinces, such as Virginia and New York, the chief judicial and executive officers, as well as members of the upper branch of the Legislature, were appointees of the crown, the general population sharing in the provincial government only through the choice of the members of the Legislature. This distribution of privilege characterized also the proprietary provinces, such as Maryland, in which, however, appointments were made by the proprietors instead of by the crown. Thus in the royal and proprietary provinces the ultimate authority was outside of the province, while in corporate Colonies all authority apparently was within each province, and there was in the scheme by which these provinces were organized no effective means of subordinating their political actions to the power of the central administration except through the alteration or abolition of their charters.

Originally nearly all the Colonies were proprietary, and while the crown subsequently sought pretexts for making them all royal provinces the people in both the proprietary and royal provinces sought to increase their power by gaining control of the public purse through annual and specific appropriations.

During the Colonial period there were several instances of the tendency of the Colonies, having very similar institutions and ideals, to act jointly as a confederate body. The first instance of a limited union of Colonies was in 1643, when Massachusetts Bay, Plymouth, Connecticut, and New Haven formed, under the title of the United Colonies of New England, a confederacy, which existed for nearly 40 years, for mutual defense against the French, Dutch, and Indians. There was also some united action during the early Indian wars, and at the beginning of the French and Indian War (q.v.), in 1754, the Colonies being strongly advised by the Lords of Trade to unite for general defense, a formal plan for a permanent general government of all the English Colonies was drawn up by Benjamin Franklin (q.v.) and presented at the Albany Convention (q.v.); but it was rejected by both the Colonies and the crown.

Although the several Colonies were at no time organically connected, except through the King, the basis for union was early laid in the establishment of local governments in which the controlling principles were similar. There appeared also a substantial identity in forms and in practices of local government. This made it natural that occasionally during the Colonial period there should appear marked tendencies towards union. In some respects, however, different types of population distinguished the several portions of settled territory, a fact due in some measure to the various classes of people in England from which the immigrants came. Thus during the period between 1620 and 1640 large numbers of dissenters withdrew from England,

and the settlements in the North increased in number and population, the main Colony of Massachusetts Bay being established in 1628-30, and numerous towns in the neighboring district being soon founded, while settlements were made (1635-36) at Hartford, Wethersfield, and Windsor, the three towns which originally constituted the Colony of Connecticut, and for the administration of which was adopted in 1639 the first written constitution of representative government. In 1638 the Colony of New Haven was established. In this period also the same body of population extended northward into what became New Hampshire, as well as into the northeastern portion of Massachusetts. On the other hand, a representative of the aristocratic class founded the Colony of Maryland in 1634. During the period of the Commonwealth in England most of the immigrants were drawn from the Cavalier and Royalist classes, which were then out of power, and by this phase of migration Virginia and Maryland especially profited. Following the Restoration the increased power of the King in Colonial politics was illustrated in the grant of the Carolinas to a body of proprietors, and of Pennsylvania to a single proprietor, while in the same period New York, acquired in 1664 by conquest from the Dutch, was organized as a royal province. The administration of New Jersey was given over to a body of proprietors, and the various settlements in Rhode Island were organized by charter into a Colony. Throughout this period there was a steady development of uniformity in the provincial governments. At the basis of it all lay the principles of a democratic or representative government, which were brought to America by the earliest colonists. A representative and popular government was established in Virginia as early as 1619, before the founding of the New England Colonies, in which democratic institutions existed in form almost from the outset. Coincident with this growth of uniformity appeared indications of divergence in theory as to the proper position of the provinces within the province and where no provision was made for English state. On the one hand, in the instances where even the executive was chosen within the the approval of provincial laws by the King, there appeared substantially independent local autonomy, the prevalence of which type would create a thoroughly decentralized system of government. On the other hand, in the instances where the Governor and all important executive and judicial officers were appointees of the crown, where the Governor's Council was chosen by the crown, and where all provincial laws were subject to the approval of the crown, there was created a strongly centralized form of Imperial government. Both of these types of provincial administration appeared in the Colonial period, although they were irreconcilable, and as one form of government recognized privileges which the colonists would not relinquish and which the home Government would not recognize as rights, and as the other form included powers which the colonists claimed were improperly exercised by the King, it was inevitable that the attempt forcibly to harmonize the two systems should create such friction as to foreshadow revolution. Originally, the Colonies were regarded as within the King's exclusive jurisdiction, and it was not until the Protectorate and the reign of Charles II that they were considered as organic portions of the Empire, so as to be governed by Parlia-

ment. (See NAVIGATION LAWS.) Protests were made against this assumption; Massachusetts and other provinces asserted their rights of self-government and of exemption from parliamentary control; and it was not until the English revolution of 1688 that settled and uniform relations with the several Colonies were established, and the increased authority of Parliament, both within the realm and in the Colonies, was fully recognized.

The effect of that revolution made more critical the underlying problem of the Colonial situation, and gradually made conspicuous the issue whether in the Colonies the legislative authority of Parliament was paramount. On the other hand, the revolution had a beneficent effect upon the Colonies in terminating unrest and friction, which had characterized the administration of the later Stuarts. Even in Virginia the prevalent discontent had been given violent expression in Bacon's Rebellion (q.v.) in 1676, while in the Northern Colonies the many contests over jurisdiction and rights and the rule established by Andros (q.v.), who had been appointed Governor of the Dominion of New England—comprising all the Colonies between the St. Croix and the Delaware—developed a general disaffection among the people to the home government and culminated in the seizure of Andros, the overthrow of his administration (1689), and the uprising under Leisler in New York.

In 1713, by the Treaty of Utrecht, England, which had been importing slaves from Africa into its American and West Indian Colonies, obtained a monopoly of the slave trade to Spanish America for 33 years, and as a result of this arrangement slavery was extended in, and to some extent forced upon, all the American Colonies. See SLAVERY.

During much of the seventeenth and eighteenth centuries there was a general feeling of loyalty towards the mother country. The sons of the more wealthy colonists, especially in the South, were educated in England. English literature was widely read in the Colonies; the Colonies, though distinct and differing in origin and character—Puritan in the East, largely Dutch Reformed in New York, Quaker in Pennsylvania, to a considerable extent Roman Catholic in Maryland, Anglican in Virginia, and German and Irish in many of the back settlements—were yet for the most part united by language, blood, and institutions.

These influences towards harmony with the mother country served to obscure to a considerable degree the recurrent disputes over charter rights and trade privileges which continued to prevail in the eighteenth century; and the tendency to union among the several Colonies was strengthened by the outbreak of the French and Indian War (q.v.). This was the last in the series of conflicts (see KING WILLIAM'S WAR; QUEEN ANNE'S WAR; KING GEORGE'S WAR; also see CANADA) which resulted from the respective territorial ambitions in North America of France and Great Britain, and left the latter in undisputed possession of Canada as well as of the territory lying between the Alleghanies and the Mississippi. As a result of the termination of this long-continued struggle with the French, which was followed by the Pontiac conspiracy of 1763 (see PONTIAC), the Colonies, which had naturally borne the brunt of the various conflicts in America, were relieved of much of their dependence upon the home government and were

left freer than they had earlier been to look after what they conceived to be their rights and interests. On the other hand, the financial necessities resulting from that war led to measures by the home government which aroused the colonists, strengthened their feelings of unity among themselves, and lessened their attachment to the English administration. Under such circumstances the basis of intercolonial unity gave force to the expressions and acts of the home government, as when in 1761 the enforcement of the Navigation Acts by general search warrants (see ASSISTANCE, WRITS OF) caused strong resentment against the home government, especially in New England, where the Admiralty attempted to enforce the law, many vessels being seized and the Colonial trade with the West Indies being seriously affected. In 1765 the passing of an Act of Parliament (see STAMP ACT) for collecting a Colonial revenue by requiring the use of stamps not only upon many business papers and legal documents, but also upon certain articles of ordinary use, caused general indignation, and led even to riots. Steps were promptly taken to unite against the common danger of an extension of the authority of Parliament; the famous Stamp Act Congress, in which nine Colonies were represented, met at New York in September, 1765, and issued a statement of grievances and a declaration of rights. The stamps were destroyed or reshipped to England, and popular societies, called Sons of Liberty (q.v.), were formed in the chief towns. In 1766 the Stamp Act was repealed, to the general relief of the colonists; but the principle of Colonial taxation by Parliament was reaffirmed, and in 1767 duties were levied on glass, paper, printers' colors, and tea. Merchants in the Colonies attempted retaliation with non-importation agreements, and in Boston the disturbances were such that Governor Gage was furnished with a military force to preserve order and enforce the laws. Thenceforth the relations between the provincial Legislature and the royal Governor were especially strained, and much bitter feeling among the people was caused by the so-called Boston Massacre (q.v.) of March 5, 1770. In 1773 the duties were repealed, excepting 3d. a pound on tea, when the matter resolved itself into a question of principle, and from North to South the people became determined that this tax should not be paid. In Boston a crowd, disguised as Indians, threw three cargoes of tea into the harbor (Dec. 16, 1773). As a penalty for such acts, Parliament passed in 1774 a series of punitive statutes, including the so-called Charter Act, by which the popular element in the provincial government of Massachusetts was greatly reduced and by which the former independence and authority of town meetings was strictly limited, and including also the Boston Port Bill (q.v.), by which the city was to be no longer a port of entry, and the Quebec Act (q.v.).

The people of Massachusetts, relying upon the theory that their charter partook of the nature of a compact which could be altered or abrogated only by the consent of themselves and of the King, denied the right of Parliament to pass statutes in any way modifying their charter rights, and insisted that the course of the King and Parliament released the colonists from all obligations and reduced them so far as government was concerned, to a "state of nature." As early as the fall of 1774 the colonists began to

organize local government on the assumption that administrative relations with England had been terminated and that the authority of the home government had ceased. Under such circumstances it was inevitable that the administration should undertake to apply a policy of repression. For further details of Colonial history, see, besides the articles already referred to, the articles on the various States.

War of Independence. It was now determined to enforce the authority of Parliament over the Colonies, and a fleet, containing several ships of the line and 10,000 troops, was sent to America. The Colonies, still asserting their loyalty, prepared to resist what they considered the unconstitutional assumptions of the home government and the unwarranted violations of their rights as English citizens. Volunteers were drilling and depots of provisions and military stores were being formed. The sending of a small force from Boston to seize one of these depots at Concord, Mass., and to capture two of the most prominent provincial leaders, Samuel Adams and John Hancock, who were staying temporarily at Lexington, led to engagements at Lexington and at Concord (see LEXINGTON) and the real beginning of the Revolutionary War, on April 19, 1775. The news of this event promptly brought from 15,000 to 20,000 armed provincials to the vicinity of Boston, to which place the British, then numbering less than 4000, were effectually confined. On May 25, 1775, reinforcements under Howe, Clinton, and Burgoyne increased the strength of the British army to 10,000 men. Outlying royal forts and arsenals, with their arms and munitions, were taken possession of by the colonists, and on May 10 and May 11 respectively Ticonderoga and Crown Point, the principal Northern fortifications, were surprised by organized forces and their artillery and stores appropriated. A congress of the Colonies, known as the Continental Congress, had assembled at Philadelphia in September, 1774, and after appeals to the home government, which proved unavailing, this body resolved to raise and equip an army of 20,000 men, and on June 15, 1775, appointed George Washington commander in chief. On June 17 Breed's Hill in Charlestown, near Boston, where a considerable force of Americans had hastily intrenched themselves, was taken by assault by the British troops, but with so heavy a loss that the defeat had for the provincials the moral effect of a victory. (See BUNKER HILL, BATTLE OF.) After a winter of great privation, during which they were closely besieged within the only city in their control, the British evacuated Boston March 17, 1776, carrying away in their fleet to Halifax a large number of Loyalists. To forestall an expected attack by Sir Guy Carleton, Governor of Canada, upon Ticonderoga, an American force under Montgomery was sent in August, 1775, to invade Canada by way of Lake Champlain, while in September another American force under Benedict Arnold was sent from Cambridge through the forests of Maine against Quebec. Montgomery captured Chambly, St. Johns, and Montreal, but on Dec. 31, 1775, the Americans were defeated before Quebec, Montgomery being killed and Arnold wounded. In the summer of 1776 Arnold, being forced to retreat, did so by way of Lake Champlain with masterly skill.

After the evacuation of Boston the British government put forth a stronger effort to reduce

the Colonies to submission. An army consisting of 55,000 men, of whom 17,000 were Hessian mercenaries, was sent, under the command of Sir William Howe. The Congress, declaring on May 15, 1776, that the royal authority had ceased, recommended to the several Colonies to adopt "such governments as might best conduce to the safety and happiness of the people"; and most of the 13 Colonies soon adopted constitutions as independent and sovereign States. On June 7, 1776, Richard Henry Lee (q.v.), of Virginia, offered a resolution in Congress, declaring that "these United Colonies are, and of right ought to be, free and independent States; that they are absolved from all allegiance to the British crown; and that all political connection between them and the state of Great Britain is, and ought to be, totally dissolved." This resolution was adopted on July 2 by the votes of 12 out of 13 Colonies, the New York delegates, who had not as yet received instructions, being excused from voting. A committee, consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston, had been appointed, on June 10, to prepare a declaration in accordance with the above resolution; and the Declaration of Independence (q.v.), written by Jefferson, based upon the equality of men, and asserting that "all government derives its just powers from the consent of the governed," on July 4, 1776, received the final assent of the delegates of 12 Colonies (the New York delegates still not voting), who thus undertook to dissolve the allegiance of the Colonies to the British crown and to declare them free and independent States.

After the evacuation of Boston General Washington, with the greater portion of his army, had hastened to New York, which was the centre of hostilities during the following summer. General Howe, having been joined by his brother, Admiral Lord Howe, and Sir Henry Clinton, defeated the Americans in the battle of Long Island, Aug. 27, 1776 (see LONG ISLAND, BATTLE OF), and thus was enabled to compel the evacuation of New York and secure the possession of its harbor and of the lower Hudson River. In spite of the gallantry of the Americans at the battle of Harlem Heights, the British retained secure control of the city and then sent a force from Long Island Sound into Westchester County, where was fought the battle of White Plains (Oct. 28, 1776), after which Washington, with the larger part of his army crossed over into New Jersey, leaving, however, a considerable force in the upper portion of Manhattan Island. There, on November 16, Fort Washington (q.v.) was captured, along with its entire garrison of about 2600 men. Washington then retreated across New Jersey towards Philadelphia, closely followed by the British, under Cornwallis, into whose hands Newark, New Brunswick, and Princeton successively fell. The British then awaited the freezing of the Delaware in order to be able to occupy Philadelphia. On Christmas night General Washington crossed in boats amid floating ice, and early on the following morning surprised and captured a Hessian force at Trenton (q.v.). On Jan. 3, 1777, he won the battle of Princeton (q.v.), and by this victory the waning confidence of the colonists was to a large extent restored, and the prospects of the American arms materially improved. The British thereupon retired to New York, where they spent the rest of the winter.

In the meantime Silas Deane and Benjamin Franklin had been sent to France to solicit recognition and aid, and, although formal recognition was delayed, important assistance was privately given in money and supplies, and European volunteers—the Marquis de Lafayette, Baron Steuben, Baron de Kalb, Kosciuszko, and Pulaski—rendered most important services. Efforts were also made, but without success, to induce the British colonies of Canada and Nova Scotia to unite in the struggle for independence, and diplomatic agents in Europe attempted to secure recognition and material assistance from various Powers. Late in September, 1777, after defeat of the Americans on the 11th at Chadd's Ford on the Brandywine (see BRANDYWINE, BATTLE OF), the British, who under Howe had come by water from New York to the head of Chesapeake Bay, took possession of Philadelphia; and Washington, after attacking the British unsuccessfully on October 4 at Germantown (q.v.), went into winter quarters early in December at Valley Forge (q.v.), where his troops suffered greatly from want of food and clothing.

In the meanwhile General Burgoyne was leading an army of 7000 British and Hessian troops with probably a larger force of Canadians and Indians, from Canada into northern New York, in order to form a junction with the British on the lower Hudson, and thus, by gaining virtual control of New York, separate New England from the rest of the Confederacy. But there was fatal delay in transmitting instructions to Howe to proceed up the Hudson, and St. Leger, who was to proceed from Canada to the Hudson by way of Oswego and the Mohawk valley, being unable to capture Fort Stanwix, withdrew after the battle of Oriskany. (See SAINT LEGER; FORT STANWIX; ORISKANY, BATTLE OF.) Burgoyne's march was delayed by felled trees and destroyed roads; the defeat of a large force of foragers at Bennington (Aug. 16, 1777) was a severe reverse (see BENNINGTON, BATTLE OF); and after the two sharp battles of Saratoga (q.v.)—on September 19 and October 7—he was compelled to capitulate to General Gates, Oct. 17, 1777, and England heard with dismay of the loss of an entire army. The Americans took between 5000 and 6000 prisoners and much artillery.

This victory was the turning point of the war. Almost equally important with its military results was its effect upon international relations, in that it gave to the European Powers the first definite proof of the possibility and even the probability of Colonial success and made it feasible for France, with a greater degree of propriety, to recognize formally the new nation, and to enter into a treaty of alliance with the United States on Feb. 6, 1778, a step which largely altered both the military and political situation and hastened the final success of the Americans. The recognition of the new nation by France prompted Lord North to a policy of reconciliation, but his commissioners, though empowered to grant virtually everything for which the colonists had originally taken up arms, were unable to secure a favorable reception without a prior recognition of the independence of the United States.

In the summer of 1778 the Americans were strengthened by the presence of a French fleet and of a considerable land force, and after the abandonment of Philadelphia by Sir Henry Clinton, who had replaced Howe in May, 1778, their

opponents in the North were confined to New-
 port and to the region around the city of New
 York. As Clinton withdrew from Philadelphia
 and marched across New Jersey towards New
 York, he was followed by Washington, who
 gained a qualified success at Monmouth on June
 28, 1778. (See *MONMOUTH, BATTLE OF*.) There-
 after the greater energy on both sides was de-
 voted to the campaign in the South, though it
 was in 1778-79 that George Rogers Clark (q.v.)
 achieved the virtual conquest of the Northwest.
 Savannah was taken (Dec. 29, 1778) by the
 British, who in the following two years, under
 Clinton and Cornwallis, secured control of Geor-
 gia and South Carolina, taking Charleston May
 12, 1780. In June, 1780, General Gates was
 placed in command of the Southern Department
 and on August 16 was badly defeated by Corn-
 wallis at Camden (q.v.). Soon afterward, on
 Sept. 23, 1780, General Benedict Arnold's trea-
 sonable plot to surrender West Point was frus-
 trated through the capture of Major André.
 The first real reverse of the British forces in the
 South was that experienced at the hands of the
 hurriedly gathered backwoodsmen at King's
 Mountain (q.v.), Oct. 7, 1780. In the following
 December General Gates was superseded by Gen-
 eral Greene as commander of the American
 army in the South, and a more active campaign
 was thereafter undertaken. At the Cowpens,
 Jan. 17, 1781, the force of Tarleton, the British
 cavalry leader, was overwhelmed by the Amer-
 icans under Morgan, while Cornwallis, after a
 dearly bought victory over Greene at Guilford
 Court House, March 15, 1781, was compelled to
 retire to Wilmington. Two more important
 battles, at Hobkirk's Hill (April 25, 1781) and
 Eutaw Springs (Sept. 8, 1781), marked the con-
 test for the control of the Southern territory.
 Finally the army of Cornwallis was confined be-
 tween the York and James rivers, where, with
 the French controlling the sea, the British com-
 mander was unable to hold out long against
 the Americans and French under Washington
 and Rochambeau. His surrender at Yorktown
 (q.v.) on Oct. 19, 1781, assured the triumph of
 the American cause. The provisional treaty of
 peace was signed at Paris in November, 1782, a
 cessation of hostilities was declared by Wash-
 ington in January, 1783, and on Sept. 3, 1783,
 the definitive Treaty of Paris was signed. (See
PARIS, TREATIES OF.) This treaty, besides recog-
 nizing the independence of the United States,
 at that time consisting of the 13 original Colo-
 nies—New Hampshire, Massachusetts, Rhode Is-
 land, Connecticut, New York, New Jersey, Penn-
 sylvania, Delaware, Maryland, Virginia, North
 Carolina, South Carolina, and Georgia—secured
 to the country the unorganized territory from the
 Alleghanies to the Mississippi. On Nov. 25,
 1783, New York was evacuated by the British.

The Confederation. The need of more unity
 of action having been felt, Articles of Confeder-
 ation, first reported to Congress in July, 1776,
 had been adopted by that body in November,
 1777, and by May, 1779, all the States had
 formally ratified them except Maryland, which
 refused its assent so long as the various States
 continued to hold the lands they claimed between
 the Alleghanies and the Mississippi. Finally
 New York offered to cede to the general govern-
 ment her claims to such lands, and, it being evi-
 dent that other States would follow her exam-
 ple, Maryland gave her assent to the Articles in
 1781, and, the necessary unanimous adoption

having thus been secured, the Articles of Con-
 federation went into effect. The result was the
 formation of a "league of friendship" only, the
 general government having no power of coercion
 and the various States being virtually independ-
 ent. The Articles provided, among other
 things, that each State was to have only one
 vote in Congress, that Congress was to be vested
 with the power of declaring war and peace and
 of negotiating treaties, that both the general
 government and the States were to have the
 power of coining and issuing money, that the
 various States were to be intrusted with the
 regulation of commerce and the raising of reve-
 nue, that Congress on appeal was to decide all
 controversies between States, and that when Con-
 gress was not in session a "Committee of the
 States," appointed by that body, was to manage
 the general affairs of the Confederation.

When the war had ended, the States had be-
 come free, but the inefficacy of their form of Fed-
 eral government became more and more appar-
 ent, and the condition of the young Confederacy
 seemed most discouraging. Its treasury was
 empty; it was burdened with a foreign debt of
 \$8,000,000, domestic obligations of \$30,000,000,
 and a paper currency of nearly \$90,000,000 which
 no one would receive. Moreover, the Congress
 whose predecessor had incurred these various
 obligations had now no power to provide for
 discharging them. It could only make recom-
 mendations to the States and urge them to pro-
 vide their share towards the expenses of the gov-
 ernment, and was wholly without power to en-
 force either upon individuals or upon the States
 a compliance with its requirements, while fur-
 thermore the States were themselves in debt and
 unwilling to respond to the demands of the Con-
 gress. An amendment to the Articles of Con-
 federation empowering Congress to levy a 5 per
 cent duty on imported goods was proposed in
 1782, but was defeated by Rhode Island, which
 alone of the States withheld its assent. When
 peace had been restored and the army disbanded,
 the government of the Confederation was, in the
 words of Washington, "little more than the
 shadow without the substance." Moreover,
 from its want of power, it soon became despised
 and neglected by those who should have been its
 chief supporters, and the ablest men preferred
 to devote themselves to the politics of their own
 States. Congress consisted of scarcely more
 than 20 members, few of whom in its closing
 years were men of any great influence. The
 evils of this lack of system were soon made evi-
 dent, when after some difficulty 12 States had
 assented to a general system of import duties,
 and the thirteenth, New York, resisted and thus
 alone was able to defeat a measure which was
 essential to the credit and security of the whole
 nation. So, too, articles in the treaty with Eng-
 land were set at naught by the different State
 governments, laws being passed by the various
 Legislatures in direct defiance of these articles,
 while Congress was unable to do more than
 merely to exhort them to annul these laws and
 to comply with the treaty. In this state of af-
 fairs thoughtful men began to see that, if the
 United States were to exist as a nation, there
 must be a central government with direct power
 both in internal and external affairs, able to
 carry on foreign negotiations in the name of the
 nation, to create statutes operative upon all the
 citizens of the States, to enforce these statutes,
 and, if necessary, to punish those who violated

them. The first men clearly to perceive and boldly declare this were Alexander Hamilton and James Bowdoin.

The Constitution. Though Hamilton had been among the most ardent supporters of American independence, he was not an advocate of the system of government that had been the immediate result of the war. He wished his countrymen to secure the advantages of a strong central government, and the model that he had in mind was the English system without the monarchical principle. In 1785 an opportunity occurred of effecting, or at least of suggesting, a radical change. In that year commissioners were appointed by Virginia and Maryland to settle certain difficulties about the navigation of the Potomac River and Chesapeake Bay. They met at Alexandria and at Mount Vernon, Washington's home, where a plan was proposed for settling commercial duties, and this led to the proposal, made by the Assembly of Virginia, for a general conference of commissioners from all the States to consider the matter of regulating trade. Hamilton, seeing that this conference might be made the instrument of more fundamental changes, persuaded New York to send commissioners, himself among them; and in 1786 commissioners from five States met at Annapolis, Md. (See ANNAPOLIS CONVENTION.) Hamilton laid before them a report, giving reasons for calling a convention of delegates from all the States to consider the reorganization of the national government. Such a proposal was adopted by the conference and submitted to Congress, by which it was indorsed, with the recommendation that each State should send delegates to a National Constitutional Convention. The suggestion was generally adopted, and the convention met at Philadelphia May 25, 1787. Washington was chosen President of the body, which proceeded to create an entirely new scheme of government rather than to revise the existing plan as had been originally intended.

The two paramount questions at issue were the powers of the Federal government and of the individual States and the system by which the States were to be represented in the Federal Legislature. Two tentative plans were laid before the convention—one by Edmund Randolph, of Virginia, the other by William Paterson, of New Jersey. The Virginia Plan, as the former was commonly called, provided that in each branch of the national Legislature representation should be according to population, while the New Jersey Plan provided for equal representation of the States in each branch. The practical question at issue was settled by the so-called Connecticut Compromise, according to which in one branch of the national Legislature representation of the States should be according to population, while in the other branch it should be equal. Other compromises were also necessary in the convention, as a result of which Congress was to be given control over commerce, three-fifths of the slaves were to be counted in estimating the population of a State with reference to its representation in the House of Representatives, and the various States were given power to admit imported slaves for 20 years. The frame of government drawn up, with later amendments, has continued as the Constitution of the United States to the present day. See CONSTITUTION.

The difficulties incident to the ratification of the proposed Constitution were enormous. The old Congress was still in existence as the na-

tional government, but it was in even lower repute and of less influence than it had been earlier in the decade, and it confessedly had neither the authority nor the power to take effective steps for the establishment of the new form of government. The convention accordingly determined to report its proceedings to the old Congress, which body was to submit the Constitution to each State for acceptance or rejection, the people of each State expressing themselves through a convention called for the purpose. All questions at issue were now revived in the vigorous and protracted discussions and contests which took place in several of these conventions. Two bitterly opposing parties arose, the Federalists (q.v.) and the Anti-Federalists, the former favoring the Constitution and the latter rejecting it. Some of the States ratified the Constitution promptly; but in others, especially Massachusetts, Virginia, and New York, the opposition was strongly developed and it was only after a protracted struggle that the opposition of such men as Patrick Henry in Virginia, and of Melancthon Smith and Yates in New York, was overcome. To this end the chief single contribution was made by the influence of the *Federalist* (q.v.), the series of essays produced by Hamilton, Madison, and Jay, in explanation and justification of the convention's work. Finally, on June 21, 1788, the ninth State, New Hampshire, ratified the Constitution, and, according to the terms of the instrument itself, by that event it went into force. The two important States of Virginia and New York followed with their approval on June 25 and July 26 respectively, leaving only North Carolina and Rhode Island in the anomalous position of not being members of the new nation which claimed jurisdiction over their territory.

During the whole period of the Confederation Congress had enacted only one piece of legislation of extraordinary and enduring importance—the Ordinance of 1787 for the government of the Northwest Territory. (See NORTHWEST TERRITORY.) After the ratification of the Constitution by the requisite number of States, the old Congress arranged a plan for carrying the new government into operation. The first Wednesday of January, 1789, was selected for the choice of electors for President and Vice President, the first Wednesday in February for the voting of the electors, and the first Wednesday in March as the date of the inauguration. The 69 electors who met in February all voted for George Washington, who was accordingly chosen President. The next highest number of electoral votes cast was 34, which were given to John Adams, who was thus elected Vice President in accordance with the method then prescribed by the Constitution. Owing to delays, however, the actual inauguration of the new government did not take place until April 30, 1789.

I and II. Washington's Administration.*

*CABINETS.—*Secretary of State*, Thomas Jefferson, Virginia, Sept. 26, 1789; Edmund Randolph, Virginia, Jan. 2, 1794; Timothy Pickens, Pennsylvania, Dec. 10, 1795. *Secretary of the Treasury*, Alexander Hamilton, New York, Sept. 11, 1789; Oliver Wolcott, Connecticut, Feb. 2, 1795. *Secretary of War*, Henry Knox, Massachusetts, Sept. 12, 1789; Timothy Pickens, Pennsylvania, Jan. 2, 1795; James McHenry, Maryland, Jan. 27, 1796. *Attorney-General*, Edmund Randolph, Virginia, Sept. 26, 1789; William Bradford, Pennsylvania, Jan. 27, 1794; Charles Lee, Virginia, Dec. 10, 1795. *Postmaster-General* (the Postmaster-General was not regularly a member of the cabinet until 1829), Samuel Osgood, Massachusetts, Sept. 28, 1789; Timothy Pickens, Pennsylvania, Aug. 12, 1791; Joseph Habersham, Georgia, Feb. 25, 1795.

(1789-97.) George Washington was sworn into office on April 30, 1789, at New York, where the newly elected Congress, the first under the Constitution, had assembled earlier in the month. The House of Representatives elected Frederick A. Muhlenberg, of Pennsylvania, as the first Speaker. The First Congress witnessed a gradual formation of two political groups, opposing each other on questions of centralization and decentralization, those favoring a liberal interpretation of the powers of the Federal government being known as Federalists, and those favoring a very strict interpretation and limitation of these powers soon styling themselves Democratic-Republicans or simply Republicans. The latter was made up in great part of the Anti-Federalists of 1787-88, but also came to include some of the advocates of the Constitution, Madison among them. Both factions were represented in Washington's first cabinet, Hamilton coming to be the recognized leader of the Federalists, and Jefferson coming to be regarded as the ablest advocate of the strict-constructionist doctrine.

Three important events of Washington's first administration, all closely connected with the work of Hamilton, were the inauguration of a scheme of tariff (see *TARIFF*), directed primarily towards the raising of revenue, but also based upon the expediency of encouraging domestic industries, the establishment in 1791 of a national bank (see *BANK, BANKING*), planned to serve partly as a fiscal agency of the new government, and the systematizing and funding of the national debt, in which were now included not only the strictly national debts, but also those obligations of the several States which had been incurred for national purposes during the Revolution. The political controversy over this assumption of State debts by the national government was, for purposes of convenient adjustment, combined with the pending controversy as to the location of the national capital, the opponents of assumption yielding upon that proposition in sufficient number to secure in return the choice of the banks of the Potomac as the seat of government. The Constitution had been put into operation without any settlement of the delicate and vital question of the authority of the new government over the territory of the States which at that time had not ratified that instrument, and the possibility of a crisis was early removed by the successive ratifications by North Carolina (November, 1789) and by Rhode Island (May, 1790). Membership in the Union was further increased by the admission of Vermont (March, 1791) and of Kentucky (June, 1792). In Washington's first term executive departments were organized by acts of Congress, the Federal judicial system was organized, in September, 1789, a national mint was established in Philadelphia, and a system of coinage devised, and in 1791 the first 10 amendments to the Federal Constitution were formally adopted.

At the request of both Federalists and Republicans Washington consented to serve a second term as President and was unanimously reelected. John Adams was also reelected to the office of Vice President, being opposed by George Clinton (q.v.), of New York, the Republican candidate. Washington's second term was one of much public turmoil and uneasiness, owing to the attitude of the two parties towards France and England, then at war. The Fed-

eralists expressed an open sympathy with England; the Republicans with France. The conduct of the French Minister to the United States, known as "Citizen" Genet (q.v.), did much to increase the popular excitement. The turbulence resulting from his injudicious course had inflamed party passions to such an extent that even Washington's calm and dignified policy did not escape the bitterest partisan denunciation. This increased in volume and intensity when the so-called Jay Treaty (q.v.) with England was laid before the Senate by the President. The Jay Treaty failed to secure the assurances from England that many believed to be justly due; but it embodied the best that could then be obtained, and the President approved it. The aspersions now recklessly heaped upon Washington became virulent; he was threatened with impeachment and even was accused of treason and of usurpation. Yet his action was justified by the revival of commerce that followed the ratification of the Jay Treaty.

The other noteworthy events of Washington's second administration were the fortunate and effective assertion of the authority of the Federal government in the suppression of the so-called Whisky Insurrection (q.v.) in Pennsylvania (1794), the adoption of a plan for internal taxation (1795), the unsuccessful expeditions under Harmar and St. Clair against the Western Indians in 1790 and 1791, the defeat of the Indians by Wayne at Fallen Timbers in 1794, the cession to the United States, in the following year of 25,000 square miles of Indian lands, and the negotiation of a treaty with Spain in 1795, whereby the United States secured the free navigation of the Lower Mississippi, the right of deposit, for a limited period, at New Orleans, and a partially satisfactory settlement of the Florida boundary. The year 1793 was marked by the invention, by Eli Whitney, of the cotton gin, which was destined to bring about an industrial revolution in the South and profoundly to affect the question of slavery. In June, 1796, Tennessee, hitherto a part of North Carolina, was admitted to the Union as a new Commonwealth. On September 17 of the same year Washington delivered his historic "Farewell Address." As he declined again to be a candidate, the two great parties waged an open warfare for the election of his successor. The Federalist candidate, John Adams, received 71 votes, and the Republican, Thomas Jefferson, 68 votes, and in accordance with the constitutional provisions then operative John Adams became President and Thomas Jefferson Vice President.

III. *John Adams's Administration.** (1797-1801.) At first the prospects of the new administration and of the Federalist party seemed extremely bright. The insolent action of the French Directory, then at the head of affairs in France, in demanding of the American Commissioners a bribe in return for a favorable hearing, inspired everywhere in the United States

* *CABINET.*—*Secretary of State*, Timothy Pickering, continued; John Marshall, Virginia, May 13, 1800. *Secretary of the Treasury*, Oliver Wolcott, continued; Samuel Dexter, Massachusetts, Jan. 1, 1801. *Secretary of War*, James McHenry, continued; Samuel Dexter, May 13, 1800; Roger Griswold, Connecticut, Feb. 3, 1801. *Secretary of the Navy*, George Cabot, Massachusetts, May 3, 1798 (until this time the navy had been under the general direction of the War Department); Benjamin Stoddert, Maryland, May 21, 1798. *Attorney-General*, Charles Lee, continued; Theophilus Parsons, Massachusetts, Feb. 20, 1801. *Postmaster-General*, Joseph Habersham, continued.

the most intense indignation. (See X Y Z CORRESPONDENCE.) War seemed imminent; indeed, hostilities actually began on sea, and General Washington was again summoned to command the army, with Hamilton as the actual head until the outbreak of hostilities. But a change in the French government made possible a reconciliation, and in 1800 a treaty removed the immediate cause of complaint.

Such popularity as the government had secured by its firm attitude towards France was soon lost by the passage, in 1798, of the Alien and Sedition Acts (q.v.). Resolutions of protest drawn by Jefferson and Madison were passed by the Legislatures of Virginia and Kentucky and became known as the Virginia and Kentucky Resolutions (q.v.). These resolutions expressed the extreme Anti-Federalist doctrine and precipitated an immediate agitation against the obnoxious laws, which helped to cause the defeat of the Federalist party in the presidential election of 1800. During Adams's administration the seat of the government was changed, in 1800, from Philadelphia, which had been the temporary capital for 10 years, to Washington, in the newly constituted District of Columbia, and John Marshall, who was destined to influence profoundly the constitutional law of the nation, became Chief Justice of the Supreme Court. In the election of 1800, 73 electoral votes were cast for Thomas Jefferson and the same number for Aaron Burr, also a Republican, while Adams had 65. There being thus no choice, the election was thrown, in accordance with Article II of the Constitution, into the House of Representatives, each State having only a single vote. After balloting for six days the House of Representatives elected Jefferson, who received the votes of 10 States, while four States voted for Burr and two voted in blank. Thomas Jefferson was thus chosen President and Aaron Burr Vice President.

IV and V. **Thomas Jefferson's Administration.*** (1801-09.) The election of Jefferson marked the complete triumph of the Republicans. He made a number of removals from office without cause, although chiefly of those whom Adams had appointed in the last hours of his administration and hence known as "midnight appointments." (See *MARBURY v. MADISON*.) Jefferson professed only to desire to maintain an equal distribution of offices between the parties and to consider only an applicant's capability and honesty. He felt free, however, to join in undoing the work of Adams by aiding in the repeal of the law creating new judicial offices to which Federalists had been appointed, and also by countenancing an attack which was made on the Federalist judges through impeachment. (See *CHASE, SAMUEL*.) He began his term of office with the extreme theories of the strict constructionists as his guide, as was shown by the steps which were promptly taken to bring about the abrogation of the system of

internal revenue (April, 1802), and to reduce to five years the term of residence requisite for naturalization (April, 1802), as also by the repeal, in December, 1803, of the National Bankruptcy Law of 1800. Nevertheless, the force of circumstances finally led Jefferson to adopt and carry through measures that involved as liberal an interpretation of the Constitution as any that the Federalists had ever advanced. The first of these measures was the purchase from France in 1803 of Louisiana, which had recently been acquired by France from Spain. (See *SAN ILDEFONSO, TREATY OF; LOUISIANA PURCHASE*.) The annexation of this territory determined permanently the control of the Mississippi and accordingly was thoroughly approved in the trans-Alleghany regions; but there was immediately raised not only the question of the government's power so to acquire territory, but also the question whether the government had acted within its constitutional powers in concluding a treaty which guaranteed citizenship to former subjects of France, and there developed a vigorous though unavailing opposition to the purchase among the members of Congress from New England. The vast enlargement of the South helps to explain the opposition of the New England States. The application of a characteristic Republican policy was, however, illustrated in the marked tendency to minimize the importance of the functions of the national government and to render unimportant such departments as those of War and the Navy. The very material reduction of the national forces was accomplished without effective opposition in view of the improved financial condition which was supposed to be secured by such a course. Any such justification was soon overbalanced by the pressing need of an efficient navy occasioned by the war with Tripoli (1801-05), in which Preble and Decatur won laurels for the American flag. (See *BARBARY POWERS, WARS WITH THE*.) In 1803 Ohio was admitted into the Union, and in December, 1803, Congress passed the Twelfth Amendment to the Constitution, which was ratified in 1804, providing that the electoral college should vote for presidential and vice presidential candidates separately. (See *CONSTITUTION*.) In 1804 Jefferson was reëlected President, receiving all the electoral votes except those of Connecticut and Delaware and two of Maryland, which were cast for the Federalist, Charles C. Pinckney, of South Carolina. George Clinton (q.v.), of New York, was elected Vice President.

Jefferson's second administration began with overwhelming Republican majorities in both Houses of Congress. The Napoleonic wars had begun anew in 1803, and it was impossible for such a struggle not to affect materially the interests of the United States. The commerce of America was highly prosperous, her ships enjoying much of the carrying trade of Europe; but in May, 1806, England declared a blockade from Brest to the Elbe, and Bonaparte, in November, decreed the blockade of the coasts of the United Kingdom. (See *CONTINENTAL SYSTEM; ORDERS IN COUNCIL*.) The maritime rights of neutrals were not at that time clearly defined, and the Americans suffered at the hands of both belligerents, American vessels being seized and searched with great insolence and discourtesy for contraband of war and being searched also by the British for British subjects. The right of expatriation was not then recognized by Eng-

* **CABINET.**—*Secretary of State*, James Madison, Virginia, March 5, 1801. *Secretary of the Treasury*, Samuel Dexter, continued; Albert Gallatin, Pennsylvania, May 14, 1801. *Secretary of War*, Henry Dearborn, Massachusetts, March 5, 1801. *Secretary of Navy*, Benjamin Stoddert, continued; Robert Smith, Maryland, July 15, 1801. (Jacob Crowninshield of Massachusetts was nominal Secretary of the Navy from March 3, 1805, till his death, April 15, 1808; Robert Smith continuing to discharge the duties of the office.) *Attorney-General*, Levi Lincoln, Massachusetts, March 5, 1801; Robert Smith, Maryland, March 3, 1805; John Breckinridge, Kentucky, Aug. 7, 1805; Caesar A. Rodney, Pennsylvania, Jan. 20, 1807. *Postmaster-General*, Joseph Habersham, continued; Gideon Granger, Connecticut, Nov. 28, 1801.

land, and those suspected of having been born on British soil were, in accordance with the doctrine, "once a subject always a subject," impressed into the British naval service. The British frigate *Leopard*, meeting the American frigate *Chesapeake*, June 22, 1807, demanded four of her men, and on refusal fired into her, and the *Chesapeake* was forced to strike her flag. The incident created intense excitement and resentment, and British ships were thenceforth forbidden to enter American harbors. See CHESAPEAKE, THE.

In December, 1807, a further step was taken in the famous Embargo Act (see EMBARGO), which forbade American vessels to leave for foreign ports, and foreign vessels to take cargoes into American ports. This measure, which was intended to punish England and France for their contempt of American rights upon the seas, almost destroyed the commerce of the United States, and was violently opposed by the Federalists, especially in New England and New York, where the shipping interest was strongest. During Jefferson's administration Aaron Burr attempted to carry out a filibustering scheme against Louisiana or Mexico, and in addition he was charged with an attempt at the dismemberment of the Union, and in 1807 was tried for treason at Richmond, Va., but was acquitted. (See BURR, AARON.) Jefferson's administration was also marked by the Lewis and Clark expedition (q.v.) across the continent to the Pacific (1804-06); by the passage of a bill in 1806 for the construction of a national road from Cumberland, Md., to Ohio, the first important internal improvement measure (see CUMBERLAND ROAD); the establishment of the United States Military Academy at West Point, and the successful introduction of steam navigation by Fulton. (See STEAM NAVIGATION.) Another important event of Jefferson's administration was the passage of an Act of Congress in 1807 abolishing the slave trade from Jan. 1, 1808.

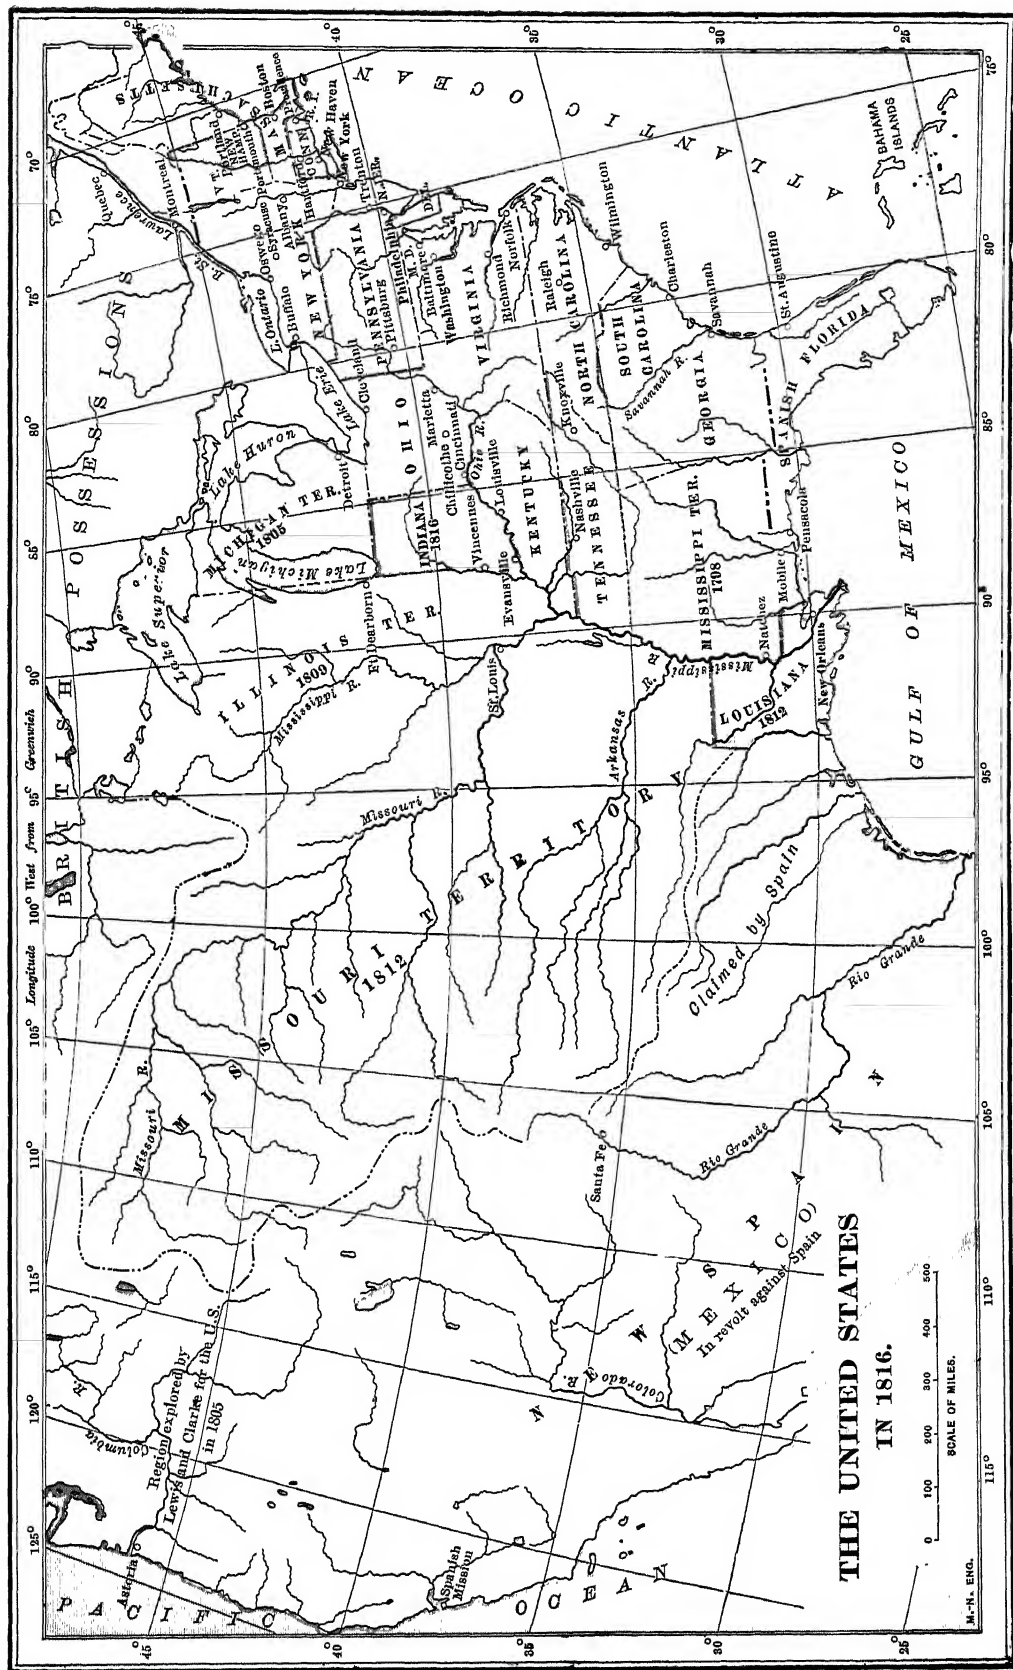

Following the example of Washington, Jefferson declined to be a candidate for a third term, and in the election of 1808 James Madison, of Virginia, was elected President, and George Clinton, of New York, Vice President. Charles C. Pinckney was again the Federalist candidate for President. In February, 1809, owing to the threatening attitude of the New England States, which seemed to menace the government with secession, the Embargo was relaxed and the Non-Intercourse Act was substituted for it, repealing the provisions of the Embargo, except as against England and France.

VI and VII. **James Madison's Administration.*** (1809-17.) The beginning of Madison's administration witnessed a further straining of relations between the United States and England. Though the acts of France had been, in the main, no less unjust and arrogant than those of England, she had never attempted the impressment of

American seamen. Moreover, the Republican party, now in power, had been traditionally the friend of France. Hence, as time went on, England was especially singled out for American dislike, and this feeling increased when the West complained that British agents were exciting disaffection on the frontiers and intriguing with the Indians, color being given to this latter charge by the hostility of some of the Indians and Tecumseh's attempt to form an Indian confederation. See TECUMSEH; TIPPECANOE, BATTLE OF.

War of 1812.—In 1810 England and France each professed a readiness to repeal the decrees that had so hampered American commerce, if the other would do so first. France then revoked conditionally the Berlin and Milan decrees, and in 1812 revoked them unconditionally, dating the revocation back one year. Meanwhile an aggressive element had risen to prominence in the councils of the Republican party. Henry Clay, of Kentucky, was Speaker of the House, and John C. Calhoun, of South Carolina, on the floor of the House was the leader of the majority. Under the impulse of these two brilliant and impetuous spirits, the party in power became transformed into a war party. Acts were passed to enlist soldiers, to organize the militia, to enlarge the navy, and to prepare in every way for war. The adoption of a war policy was urged upon the President, who was himself reluctant to adopt it. England having refused to modify her policy towards neutrals, an embargo upon all American shipping was proclaimed for 60 days as a preliminary to the opening of hostilities; and on June 1 Madison sent a message to Congress in which, after reviewing the American grievances against England, he recommended a formal declaration of war. The chief grounds for this action, as given by Madison, were the impressment of American seamen, the extension of the right of search to United States war vessels, the "paper blockades" established by the British Orders in Council, and the alleged efforts of Great Britain to persuade the Northwestern Indians to attack the Americans. On the 18th Congress formally declared war. Five days later, and before the declaration reached England, the British government withdrew its objectionable Orders in Council, but although attempts were then made to restore peace, reconciliation at that time was impossible. The disparity in power between the United States and Great Britain at this time was enormous, and except that the latter was still engaged in her conflict with Napoleon, a declaration of war would have seemed little less than foolhardy. In 1810 the population of the United States was only about 7,250,000, while that of Great Britain was fully 18,500,000. Great Britain, moreover, had vastly superior resources at her disposal, was organized for war, while the United States was not, and, besides having a large and highly disciplined army, was the acknowledged mistress of the seas. In general, the war went against the Americans on land, though the British were decisively repulsed at New Orleans; and the warfare on sea demonstrated the superiority, vessel for vessel, of the American to the British navy. Gradually, however, by reason of her vastly larger fleet, Great Britain defeated the American vessels in detail or drove them under the shelter of forts. The American naval successes were, nevertheless, of such number and of such tactical importance as to add greatly to the standing of the United States as a naval power. Congress

THE UNITED STATES
IN 1816.

SCALE OF MILES.

M-TH. ENG.

had voted to raise 25,000 enlisted soldiers, 50,000 volunteers, and 100,000 militia. Gen. William Hull with over 2000 men at Detroit invaded Canada, but, on being met by a small force of British and Indians under General Brock, recrossed the river, and on August 16 surrendered at Detroit without resistance. A second invasion of Canada was made in October, 1812, near Niagara Falls, by General Van Rensselaer. One thousand American militia stormed the heights of Queenston, and the British general, Brock, was killed, but, reinforcements arriving, the heights were retaken, and the Americans were defeated with great loss, some of them surrendering. Some of the militia refused to cross into Canada, upon the ground that the government had no right to send the militia across the frontier.

American disasters on the land were, however, compensated for by victories at sea. On August 19 the United States frigate *Constitution* (q.v.) captured the British frigate *Guerrière*; on October 13 the *Wasp* (American) took the *Frolic* (British); on October 25 the *United States* captured the *Macedonian*; on December 29 the *Constitution* took the *Java*; and on February 24 the *Hornet* sank the *Peacock*. The Americans in most cases had the larger ships and heavier ordnance, but the immense disparity in the losses showed also superior seamanship and gunnery. American privateers, furthermore, took during the war, it is estimated, 300 British vessels and 3000 prisoners.

In May, 1812, Madison had been renominated for the presidency, with Elbridge Gerry, of Massachusetts, as the Republican candidate for Vice President. In the ensuing election Madison defeated De Witt Clinton by an electoral vote of 128 to 89, while Gerry defeated Jared Ingersoll by an electoral vote of 131 to 86.

In April, 1813, an American army of 1700 men under Gen. Henry Dearborn captured York, now Toronto, and, Dearborn having been relieved, Generals Wilkinson and Hampton undertook to capture Montreal, but met with no success. An attempt of the British general, Prevost, on Sackett's Harbor in May was repulsed; the British squadron on Lake Erie, consisting of 6 vessels carrying 63 guns, was captured on Sept. 10, 1813, by Commodore Perry at the head of an American flotilla of 9 vessels with 54 guns (see *ERIE, BATTLE OF LAKE*); and this latter success enabled General Harrison to invade Canada, where he defeated General Proctor in the battle of the Thames (October 5), in which the great Indian warrior chief Tecumseh was killed. During the same period Gen. Andrew Jackson in Alabama and Georgia defeated the Creek Indians, who had been incited to make war upon the frontier settlements. In the summer of 1814 Gen. Jacob Brown, with Col. Winfield Scott as his second in command, crossed to the Canadian side, captured Fort Erie (q.v.) on July 2, and defeated General Riall at Chippewa on July 5. On July 25 the indecisive battle of Lundy's Lane was fought, the Americans being under the immediate command of Scott; and the American forces then withdrew to Fort Erie, where they were besieged. (See *FORT ERIE*.) General Wilkinson also invaded Canada along the Sorel River, but was easily repulsed. A British invasion, by Lake Champlain, under Prevost, with 11,000 men and a flotilla on the lake, ended disastrously. On September 11 the flotilla was signally defeated in the harbor of

Plattsburg by an American squadron under Commodore McDonough, while the army was repulsed on shore and retreated with heavy loss. In August a British fleet ascended Chesapeake Bay and landed troops which, after dispersing with little difficulty a force of American militia at Bladensburg (q.v.), entered Washington and burned the government buildings. A subsequent attack on Baltimore was unsuccessful. New York, New London, and Boston were blockaded, and a large expedition was sent against Mobile and New Orleans.

On Jan. 8, 1815, General Pakenham attacked New Orleans, but his army was repulsed with great loss by General Jackson at the head of an inferior militia force. (See *NEW ORLEANS, BATTLE OF*.) This action was fought two weeks after peace had been concluded by the Commissioners of England and the United States.

From the middle of 1813 the fortunes of war alternated on the sea. On June 1, 1813, the American frigate *Chesapeake* was taken by the *Shannon* and the American sloop *Argus* by the *Pelican* on August 14; the British brig *Bower* was captured by the *Enterprise* on Sept. 5, 1813; the American frigate *Essex*, after a memorable career under Porter, surrendered to the *Phæbe* and *Cherub* on March 28, 1814; the British brig *Epervier* was captured by the *Peacock* on April 20, 1814; the British sloop *Avon* was sunk by the *Wasp* on Sept. 8, 1814; on Jan. 15, 1815, after the conclusion of peace, the American frigate *President* was taken by the British; and on February 20 the American frigate *Constitution* captured the *Cyane* and the *Levant*.

In December, 1814, the Federalists of New England held a convention at Hartford in opposition to the war and the administration. (See *HARTFORD CONVENTION*.) The treaty of peace concluded with England at Ghent on Dec. 24, 1814 (see *GHENT, TREATY OF*), was announced in February, 1815. The terms did not include any affirmative withdrawal of England's claim to search American ships, but nevertheless all parties in the country approved it.

In 1815 Commodore Decatur commanded an expedition against the Algerians, whose corsairs had preyed on American commerce in the Mediterranean, and dictated terms to Algiers, Tunis, and Tripoli. See *BARBARY POWERS, WARS WITH THE*.

With the end of the War of 1812 came the virtual extinction of the Federalist party, whose unpatriotic course during the struggle had made its name odious to the nation as a whole. It ceased thereafter to make itself felt in national affairs (see *FEDERALISTS*), and for a time the country had the singular fortune to find all its citizens seemingly of one party, with principles derived from both the old party creeds. Perhaps the most marked influence left by the Federalists upon the political tenets of their opponents and upon the popular mind was to be found in the now very general recognition of the broad powers of the central government. This national idea had sustained the Republicans in the more liberal view which the war had compelled them to take of the inherent powers of the Federal government. The noticeable effect of the war period in strengthening the Nationalist tendency was immediately illustrated by adequate plans for national defense; by the granting of the charter of the second United States Bank (see *BANK, BANKING*) in 1816; by the passage of the first really protective tariff, under the

guidance of Dallas, in the same year (see *TARIFF*); and by the activity of Congress in attempting to appropriate large amounts of the national funds for public roads and similar improvements of a local character, an important bill for this purpose, passed by Congress in 1816, being, however, vetoed by Madison on the ground of its unconstitutionality. The tendency was also emphasized by judicial decisions (as in *Martin v. Hunter's Lessee*, 1816, and *Cohens v. Virginia*, 1821), establishing the supremacy of the Federal judicial power over that of the States, while in *McCulloch v. Maryland*, in 1819, Chief Justice Marshall introduced into the law of the land his advanced views as to the relation of the States to the Union and elaborated his theory of the supreme and exclusive authority of the latter. For the moment the close of Madison's administration found the country, as a whole, scarcely divided by party differences, so that the presidential election of November, 1816, resulted in the choice of James Monroe, of Virginia, as President, and Daniel D. Tompkins, of New York, as Vice President, these candidates receiving 183 electoral votes, while the votes of only three States—Massachusetts, Connecticut, and Delaware—were cast for the Federalist candidate, Rufus King, of New York. The Federalists made no formal nomination for the office of Vice President. In Madison's first administration Louisiana was admitted into the Union (1812), and in the second Indiana (1816).

VIII and IX. **James Monroe's Administration.*** (1817-25.) The period of Monroe's term of office has been commonly known in American political history as the Era of Good Feeling. Party questions were in abeyance, and when, in May, 1817, the President began an extended tour in the Northern and Western States, the warmth of the welcome given him by all classes of the people showed that the nation was contented, prosperous, and loyal. In accordance with the recommendations of the President's first message, the slightly protective tariff of 1816 was continued for seven years. (See *TARIFF*.) On Dec. 10, 1817, Mississippi was admitted to the Union. In 1818 (December 3) Illinois became a State, and on Feb. 22, 1819, the United States purchased from Spain for \$5,000,000 the territory of east and west Florida (in which region hostilities had recently been carried on against the Seminole Indians), together with all the claims which Spain might have to territory as far west as the Pacific, north of the forty-second parallel, including, of course, the Oregon country; while the United States relinquished all claim to the province west of the Sabine River (Texas). This treaty, however, was not formally ratified until 1821. Early in 1818 the people of the Territory of Missouri (q.v.), which had been included in the Louisiana Purchase, applied for admission to the Union. A bill providing for such admission was framed, but amended in the House in such a way as to forbid slavery in the new State. As so amended, the bill passed the House by the votes of the mem-

bers from the free States, but was defeated in the Senate. This action brought the question of slavery prominently into the sphere of national politics, never again to disappear until the extinction of that institution as the result of the war between the States in 1861-65. In the Congress which met in December, 1819, the question of the admission of Missouri was again brought forward, coupled with a proposition for the admission of Maine, which had hitherto been a part of Massachusetts. An arrangement known as the Missouri Compromise (q.v.) was effected (1820) by the action of Clay and the conservative members of both sections. Maine was admitted in 1820 and Missouri in 1821, the latter step having been delayed by a vigorous debate in Congress occasioned by a clause in the proposed State constitution which prohibited the settling of free negroes in the State (see *MISSOURI COMPROMISE*), the Missouri Legislature finally pledging the State not to shut out any negro citizen of another State. At the same session of Congress, Alabama was admitted to the Union (Dec. 14, 1819). In 1820 the presidential campaign resulted in the reelection of Monroe and Tompkins, Monroe receiving all the electoral votes but one, which was cast for John Quincy Adams.

In 1821 the strict constructionists among the Republicans defeated bills looking to a national canal system and a higher tariff, and the next year the President vetoed a bill for the outlay of national funds upon the Cumberland Road (q.v.). In December, 1823, in his annual message to Congress, Monroe promulgated the famous declaration that has since been known as the Monroe Doctrine (q.v.). In 1824, the Nationalist policy being then followed by a majority in both Houses, there was adopted a more strictly protective tariff, framed with the design of excluding foreign competitors from American markets (see *TARIFF*), while a bill for making surveys for a national canal system also became law. The political issues arising out of the founding of a new government as well as out of international complications had now lost their importance, and attention was becoming centred on internal matters, as to none of which were sectional or fractional issues as yet clearly drawn, although the sudden introduction of the slavery question into congressional politics was to acquire more significance than any other circumstance of the administration. However, as there was now only one political party, the Republican, the presidential election of 1824 was largely a personal and factional contest. When the electoral votes were counted, 99 were for Andrew Jackson, of Tennessee, 84 for John Quincy Adams, of Massachusetts, 41 for William H. Crawford, of Georgia, and 37 for Henry Clay, of Kentucky; there being thus no choice for President, and the decision being thrown into the House of Representatives, where, by a coalition of the supporters of Clay and Adams, the latter was finally chosen, Adams receiving the votes of 13 States, while Jackson had those of seven, and Crawford those of four. The electors had chosen John C. Calhoun, of South Carolina, to be Vice President by a vote of 182 to 78 for various other candidates.

X. John Quincy Adams's Administration.*

* **CABINET.**—*Secretary of State*, John Quincy Adams, Massachusetts, March 5, 1817. *Secretary of the Treasury*, William H. Crawford, continued. *Secretary of War*, George Graham, Virginia, April 7, 1817; John C. Calhoun, South Carolina, Oct. 8, 1817. *Secretary of the Navy*, B. W. Crowninshield, continued; Smith Thompson, New York, Nov. 9, 1818; John Rogers, Massachusetts, Sept. 1, 1823; Samuel L. Southard, New Jersey, Sept. 16, 1823. *Attorney-General*, Richard Rush, continued; William Wirt, Virginia, Nov. 13, 1817. *Postmaster-General*, R. J. Meigs, continued; John McLean, Ohio, June 26, 1823.

* **CABINET.**—*Secretary of State*, Henry Clay, Kentucky, March 7, 1825. *Secretary of the Treasury*, Richard Rush, Pennsylvania, March 7, 1825. *Secretary of War*, James Barbour, Virginia, March 7, 1825; Peter B. Porter, New York,

(1825-29.) A new division of the American people into parties dates from the beginning of this administration. The party previously known as Republican or Democratic-Republican soon took the name of Democratic (see DEMOCRATIC PARTY), while the Clay and Adams factions, which had been identified with the doctrine of loose construction, after taking the name of National Republican, changed it eventually to that of Whig (see WHIG PARTY), by which the party continued to be known for some 25 years. The basis for the new party division lay largely in the factional differences between the followers of Adams and those of Jackson, and one result of this was the prolonged controversy throughout the administration of Adams and the development of especially bitter relations between the factions of the leaders, which continued throughout the two terms of Jackson. Owing to the determined obstruction which was made by the opponents of the administration, few of its measures were carried, so that the net results of the four years' work were comparatively slight, and the period became distinguished chiefly by the partisan conflicts preliminary to the overthrow of the Adams faction in 1828.

During the suspension of commerce by the War of 1812 large amounts of capital were withdrawn from trading ventures and diverted to manufacturing establishments, with the result that gradually New England and the northern coast States ceased to be free-trade regions and became desirous of a protective tariff policy, while the South arrayed itself on the side of free trade. Upon the return of peace the new manufacturing establishments were not firmly enough established to compete successfully with the foreign manufacturers, and accordingly in 1824 an Act was passed for the purpose of giving the control of the home market to the wool manufacturers. This failing of its purpose, a national convention of Protectionists at Harrisburg, Pa., in July, 1827, advocated a strongly protective policy, and in 1828 a tariff framed in accordance with these views became law. The South denounced this measure as being sectional legislation, intended to benefit New England and the Middle States at the expense of the South, and the doctrine of nullification (q.v.), which had been promulgated in the Kentucky Resolutions of 1798 (see VIRGINIA AND KENTUCKY RESOLUTIONS), and had been revived in South Carolina in 1827, began to be widely accepted in the Southern States. Adams's administration was further marked by the expenditure by the national government of some \$14,000,000 for internal improvements; by the rapid immigration to the West, greatly promoted by the opening of the Erie Canal; and by the debates in Congress over the advisability of sending delegates to the Panama Congress (q.v.). In 1828 the Democratic candidate for President, Andrew Jackson, of Tennessee, received 178 electoral votes to 83 cast for John Quincy Adams; and John C. Calhoun was reelected Vice President, having 171 electoral votes. The accession of President Jackson was the beginning of a new era in political practice. A radical change was typified by the discontent with the existing methods, which led to the more direct participation of the public at large in political affairs through the rise of the nominating convention and through the practice

of choosing presidential electors by popular vote. Nomination by State Legislatures had supplanted the former method of nominating by congressional caucus. This marked departure towards practical democracy was emphasized by the striking influence which the new Western States and their ideals and standards of life now secured over national politics.

XI and XII. **Andrew Jackson's Administration.*** (1829-37.) The bold, decisive, and impetuous character of President Jackson was shown in a general removal of those, down to small postmasters and tidewaiters, who had held office under the late administration and in the appointment of his own partisans. The administration was distinctively one of conflict, the chief issues being the United States Bank and the tariff; and Jackson was swayed throughout, to a considerable extent, by the influence of a group of friends who became known collectively as the kitchen cabinet (q.v.). South Carolina declared the high protective tariff acts of 1828 and 1832 to be unconstitutional and therefore null and void, and threatened to withdraw from the Union if an attempt were made to collect the duties on foreign importations. The President prepared to execute the laws by force; Calhoun resigned his office of Vice President, and in the Senate, to which he was promptly sent, asserted the doctrine of State rights, including the right of secession. (See NULLIFICATION.) A collision seemed imminent, but the affair was settled by a compromise bill, introduced by Henry Clay, providing for a gradual reduction of duties until 1842, when they were not to exceed 20 per cent ad valorem. As an incident of this controversy, though nominally occasioned by a resolution calling for an inquiry into the sale of government lands, occurred the famous debate (January, 1830) in the Senate between Daniel Webster (q.v.), of Massachusetts, and Robert Y. Hayne (q.v.), of South Carolina, in which the two opposing views regarding State rights, nullification, and the true interpretation of the Constitution were advocated and discussed with such eloquence, learning, and enthusiasm as to make the debate a landmark in the constitutional development of the United States. The same period witnessed the rise of the Antimasonic party, based on opposition to Freemasonry and to secret societies generally. See MORGAN, WILLIAM; ANTIMASONS.

The President was a pronounced opponent of the national bank, the existence of which under its second charter was to continue to 1836. Jackson early raised the issue of its constitutionality, whereupon the friends of the bank introduced and carried through both Houses a bill

*CABINET.—*Secretary of State*, Martin Van Buren, New York, March 6, 1829; Edward Livingston, Louisiana, May 24, 1831; Louis McLane, Delaware, May 29, 1833; John Forsyth, Georgia, June 27, 1834. *Secretary of the Treasury*, Samuel D. Ingham, Pennsylvania, March 6, 1829; Louis McLane, Delaware, Aug. 8, 1831; William J. Duane, Pennsylvania, May 29, 1833; Roger B. Taney, Maryland, Sept. 23, 1833; Levi Woodbury, New Hampshire, June 27, 1834. *Secretary of War*, John H. Eaton, Tennessee, March 9, 1829; Lewis Cass, Michigan, Aug. 1, 1831; Benjamin F. Butler, New York, March 3, 1837. *Secretary of the Navy*, John Branch, North Carolina, March 9, 1829; Levi Woodbury, New Hampshire, May 23, 1831; Mahlon Dickerson, New Jersey, June 30, 1834. *Attorney-General*, John M. Berrien, Georgia, March 9, 1829; Roger B. Taney, Maryland, July 20, 1831; Benjamin F. Butler, New York, Nov. 15, 1833. *Postmaster-General* (the Postmaster-General first came to be a regular member of the cabinet in Jackson's administration), William T. Barry, Kentucky, March 9, 1829; Amos Kendall, Kentucky, May 1, 1835.

May 26, 1828. *Secretary of the Navy*, S. L. Southard, continued. *Attorney-General*, William Wirt, continued. *Postmaster-General*, John McLean, continued.

for its continuation. This was vetoed, and its supporters were unable to carry the bill over the veto. The question, however, was made the chief issue in the campaign of 1832, in which the decisive triumph of Jackson was taken by him to be a vindication of his policy and an assurance that he represented the popular will more accurately even than did Congress. The result was still further to strengthen his position and to increase his influence over congressional action. In the election of 1832 he received 219 electoral votes, as against only 49 for Henry Clay, 11 for John Floyd, of Virginia, and 7 for William Wirt, of Virginia. Martin Van Buren was elected Vice President, receiving 189 votes.

The Cherokee Indians in Georgia, who had attained to a certain degree of civilization, appealed to the President for protection against the seizure of their lands by the State; but they were told that he "had no power to oppose the exercise of the sovereignty of any State over all who may be within its limits"; and the Indians were obliged to remove to the territory set apart for them west of the Mississippi. In 1832, in the West, trouble with Indians had culminated in the Black Hawk War (see BLACK HAWK), and now in 1835 the Seminole War broke out in Florida, and a tribe of Indians, insignificant in numbers, under the crafty leadership of Osceola (q.v.), kept up hostilities for years, at a cost to the United States of several thousands of men and some \$50,000,000. The removal in 1835 by order of the President of the government deposits from the United States Bank to certain State banks led to the weakening of the bank and, after some years, to the adoption of Van Buren's plan of an independent treasury. Later the Senate, which was controlled by the Whigs, as Jackson's opponents now styled themselves, led by Henry Clay, took the extraordinary step of passing formal resolutions of censure of the President for his order removing the government deposits from the bank. The President protested against the resolution, but the protest was not allowed by the Senate to appear upon the record. The warfare between the President and Senate continued through the next two years, the latter frequently rejecting the nominations made by the executive. In 1837, however, largely under the influence of Benton, the Senate, which had at last become Democratic, voted to expunge from its records the resolutions of censure already mentioned. In 1835 (December 7) the President announced to Congress that the national debt would soon be paid and that provision should be made for the surplus revenue which was anticipated. In June, 1836, a bill was passed providing that after Jan. 1, 1837, any surplus exceeding the sum of \$5,000,000 should be divided among the States as a loan, subject to a recall by Congress; and in accordance with this Act some \$28,000,000 was divided in 1837, which has never been recalled. In July, 1836, the President caused the famous Specie Circular to be issued, which ordered the agents of the government to receive only gold or silver in payment for public lands.

At this time Texas, which had been colonized by Americans, was endeavoring to free itself from Mexican control and to establish its independence. In February, 1837, the independence of Texas was recognized; its subsequent annexation was but an incident of westward expansion. Many manifestations of sympathy with the Texans were therefore made, and assistance was

freely given them by individuals from every part of the Union, and a resolution recognizing the independence of Texas passed the Senate, but not the House. A new era in the slavery controversy had been inaugurated with the establishment of the *Liberator* by Garrison in 1831. The New England Antislavery Society was organized in 1832, and the American Antislavery Society at Philadelphia in 1833. (See SLAVERY; GARRISON, W. L.; PHILLIPS, WENDELL; ABOLITIONISTS; GAG RULES.) Arkansas (June 15, 1836) and Michigan (Jan. 26, 1837) were admitted to the Union. The administration of Jackson was further marked by the political acerbities growing partly out of the Peggy O'Neill affair (see EATON, MARGARET), and leading to the reorganization of the cabinet, by the treaty with France settling the spoliation claims and the treaty with England securing unrestricted direct trade with the British West Indies, by the adoption on a large scale by Jackson of the "spoils system," and by the introduction of railroads. The election of 1836 resulted in the success again of the Democratic party, whose candidate for President, Martin Van Buren, of New York, received 170 electoral votes, against 73 for William Harrison, of Ohio, and 51 scattering. No candidate for Vice President received a clear majority, and so the Senate elected Richard M. Johnson (q.v.), of Kentucky.

XIII. Martin Van Buren's Administration.* (1837-41.) Van Buren, in accordance with his pledges, carried out and perpetuated the policy of his predecessor. The new administration was unfortunate in its beginnings. A financial disaster, such as had not until then been known in the United States, swept over the country in 1837. A general suspension of specie payments occurred; many banks suspended altogether, and innumerable corporations and individuals were ruined. Congress authorized the issue of \$10,000,000 in treasury notes, and Jackson's Specie Circular was revoked. Van Buren's administration was marked by the establishment of the independent treasury system (reestablished in 1846), by a renewal of hostilities against the Seminole Indians, and by the establishment of regular steamship communication with Europe. The Democrats with difficulty retained control of the House of Representatives, and through such methods as to decrease public confidence in the party leaders. This, together with the prevalent depression in business, weakened the dominant party in the country at large, so that in the campaign of 1840 the candidacy of the Whig nominee, Gen. William Henry Harrison (q.v.), of Ohio, was supported with an enthusiasm such as no subsequent political campaign has ever witnessed. It has become known as the Log Cabin Campaign and the Hard Cider Campaign, from the prevalent symbols of the homely and simple frontier life of General Harrison. The Liberty party (q.v.) also made nominations, their candidates being James G. Birney (q.v.), of New York, for President, and Francis Lemoyne, of Pennsylvania, for Vice President. The Democrats renominated Van Buren, but the convention did not agree upon the choice of a candidate

* **CABINET.**—*Secretary of State*, John Forsyth, continued. *Secretary of the Treasury*, Levi Woodbury, continued. *Secretary of War*, Joel R. Poinsett, South Carolina, March 7, 1837. *Secretary of the Navy*, Mahlon Dickerson, continued; James K. Paulding, New York, June 25, 1838. *Attorney-General*, Peniamin F. Butler, continued; Felix Grundy, Tennessee, July 5, 1838; Henry D. Gilpin, Pennsylvania, Jan. 11, 1840. *Postmaster-General*, Amos Kendall, continued; John M. Niles, Connecticut, May 19, 1840.

for the vice presidency. General Harrison received 234 electoral votes to 60 for Van Buren; and for Vice President the Whig, John Tyler, of Virginia, received 234, against 48 for R. M. Johnson and 12 scattering.

XIV. William Henry Harrison's (1841) and John Tyler's Administration.* (1841-45.) Two weeks after his inauguration, President Harrison issued a proclamation calling an extra session of Congress to consider the financial distress prevailing throughout the country and other questions that beset the government. The extra session was called for May 31, but on April 4 the President died after a short illness. The new President, John Tyler, retained for a few months his predecessor's cabinet. When Congress met in accordance with General Harrison's call of March 17, the Whigs, who had a majority in both Houses, began to carry out the changes to which their party had pledged itself in the campaign of the preceding year. A bill was passed for the incorporation of a new United States Bank, to be called the Fiscal Bank of the United States, planned somewhat after the model of that which had been so vigorously attacked by President Jackson. To the consternation of the Whigs, the new President on August 16 vetoed it as being unconstitutional, since it provided for the establishment of branches of the bank in the various States without securing the prior consent of these States. The leading members of the party then conferred with President Tyler and asked him to suggest the provisions of a bill that he would be willing to accept. He is said to have agreed to do so, yet after the bill had passed the two Houses (September 3) it promptly met the fate of the former Act. It now became evident that the President was at heart a Democrat, and that his political principles would prevent him from acting cordially with the party that had elected him to office. The indignation and chagrin of the Whigs were unbounded. The entire cabinet with one exception immediately resigned, Webster remaining in the State Department until pending negotiations with England had been completed. On September 11 the leaders of the Whig party issued a manifesto reading the President out of the party and holding him responsible for the failure to effect the reforms that had been promised. President Tyler immediately filled the places in his cabinet with conservative politicians and, having been cut off from political affiliation with his own party, turned to the Democrats for support.

During Tyler's administration the relations between the United States and Great Britain became very strained. In the course of an insurrection in Canada in 1837 a party of supporters of the Canadian government had

crossed over to the American territory and destroyed a vessel, the *Caroline*, owned by the friends of the insurgents. In the affair one American had been killed. In 1840 one Alexander McLeod, who had come to New York State and boasted of having taken part in the destruction of the *Caroline*, was arrested and indicted for murder. England protested vigorously, and serious international complications for a time seemed imminent. (See *CAROLINE*.) Again, in October, 1841, the British freed most of the slaves aboard an American vessel, the *Creole*, which had been seized by them and carried into a port in the Bahamas. (See *CREOLE CASE*.) Thus each nation had a grievance against the other, and such ill feeling resulted that war was feared.

Fortunately Webster, Tyler's Secretary of State, was liked and respected by English statesmen, and upon the reorganization of the cabinet he retained his office until the pending negotiations were concluded. In 1842 Lord Ashburton was sent out from England to negotiate a treaty, with particular reference to adjusting the boundary between Canada and the Northeastern States. The boundary question was settled by a compromise, England gaining by the treaty 5000 more square miles than the Treaty of 1783 allowed her. Two other points of importance were settled by this treaty. One was the agreement of the two governments looking to the suppression of the slave trade. The other was the provision for mutual surrender of criminals. The treaty was concluded on Aug. 9, 1842, and was proclaimed on November 10. See *NORTHEAST BOUNDARY DISPUTE*; *WEBSTER-ASHBURTON TREATY*.

In 1844 the government arranged a treaty with the new Republic of Texas (q.v.), providing for the future annexation of that country to the United States. The Senate rejected this treaty by a vote of 35 to 16, seven Democrats voting with the Whigs for rejection. The problem of the future relations with Texas became still more critical in national politics, and its immediate importance was increased by the strong desire for annexation among the Southern leaders. To maintain the status quo the annexation of Texas became an actual necessity to the interests of the South; for should the free States ultimately acquire a dominant power in the Senate, as they had already done in the House, the time might come when the existence of slavery would be imperiled. The possibility of this was kept continually before the Southern mind by the increasing activity in the North of the Liberty party (q.v.), which in 1843 held a national convention at Buffalo and there put forth a series of resolutions denouncing slavery, and calling on the free States to pass penal laws to prevent the return of fugitive slaves, and which again nominated James G. Birney for the presidency. England was taking an active interest in Texas affairs, which alarmed many people, North and South, lest this splendid region should be lost. The Whigs at their convention held at Baltimore in May, 1844, nominated Henry Clay, of Kentucky, with Theodore Frelinghuysen, of New York, as the candidate for Vice President. The Democratic convention, in the same month, nominated James K. Polk, of Tennessee, and George M. Dallas, of Pennsylvania, and adopted a platform calling for the reannexation of Texas and the reoccupation of Oregon. The position of Clay as to the annexation of Texas was so equivocal as to arouse the suspicion of many

* *CABINET*.—*Secretary of State*, Daniel Webster, Massachusetts, March 5, 1841; Hugh S. Legaré, South Carolina, May 9, 1843; A. P. Upshur, Virginia, July 24, 1843; John C. Calhoun, South Carolina, March 6, 1844. *Secretary of the Treasury*, Thomas Ewing, Ohio, March 5, 1841; Walter Forward, Pennsylvania, Sept. 13, 1841; John C. Spencer, New York, March 3, 1843; George M. Bibb, Kentucky, June 15, 1844. *Secretary of War*, John Bell, Tennessee, March 5, 1841; John McLean, Ohio, Sept. 13, 1841; John C. Spencer, New York, Oct. 12, 1841; James M. Porter, Pennsylvania, March 8, 1843; William Wilkins, Pennsylvania, Feb. 15, 1844. *Secretary of the Navy*, G. E. Badger, North Carolina, March 5, 1841; A. P. Upshur, Virginia, Sept. 13, 1841; David Henshaw, Massachusetts, July 24, 1843; T. W. Gilmer, Virginia, Feb. 15, 1844; John Y. Mason, Virginia, March 14, 1844. *Attorney-General*, John J. Crittenden, Kentucky, March 5, 1841; Hugh S. Legaré, South Carolina, Sept. 13, 1841; John Nelson, Maryland, July 1, 1843. *Postmaster-General*, Francis Granger, New York, March 6, 1841; Charles A. Wickliffe, Kentucky, Sept. 13, 1841.

Northerners, while the position of the Democrats on the Oregon question helped them in the Northwestern States. The election resulted in the choice of Polk and Dallas after a very close contest in which the Democrats succeeded only by the fact that several thousand votes in New York were cast for the antislavery ticket.

At the next session of Congress a joint resolution for the annexation of Texas was passed early in 1845 by both Houses and approved on March 1 by the President. It renewed the features of the Missouri Compromise as regards the Texan territory north of the compromise line, and as to the territory south of that line the question of slavery was left to the decision of the inhabitants of the States to be formed out of Texas.

Tyler's administration was marked by the Dorr Rebellion in Rhode Island (see DORR, THOMAS W.; RHODE ISLAND), by antirent disturbances in New York (see ANTIRENTISM), and by the construction under the direction of S. F. B. Morse (q.v.) of the first successful long-distance telegraph line (1844).

XV. James K. Polk's Administration.* (1845-49.) *War with Mexico.*—Soon after the beginning of Polk's administration United States troops under General Taylor were sent across the Nueces River to Corpus Christi, in territory then in dispute between the United States and Mexico, the United States claiming the Rio Grande as the boundary of Texas, and Mexico claiming the Nueces. In the meantime both the Texan Congress (on June 18, 1845) and a convention of the people (on July 4) had ratified the act of annexation, and on December 29 Texas formally entered the Union. Up to this date Mexico, being distracted by revolutions, had simply protested against the action of the United States and had recalled her Minister from Washington; but in the spring of 1846 the further advance of General Taylor towards the Rio Grande brought United States troops into conflict with the Mexicans, a small engagement taking place on April 24. The Mexicans were then defeated at Palo Alto on May 8 and on the following day at Resaca de la Palma. On May 11, 1846, news of the hostilities on April 24 having reached Washington, the President officially informed Congress of the occurrence and asked that war be declared. Both Houses responded to the message and to the awakened war spirit of the country by passing a bill (on May 13) whose preamble began as follows: "Whereas, by the act of Mexico, a state of war exists between that government and the United States"—a statement that provoked much criticism from the opponents of the administration, as false, in view of the fact that hostilities had been precipitated by the military occupation of territory claimed by Mexico. The bill appropriated \$10,000,000 for the prosecution of the war, and under it enlistment was actively begun. Volunteers to the number of 50,000 men were authorized. On May 23 Mexico formally declared war upon the United States. Whatever view one might take of the political aspect of the war, the brilliant series of victories aroused widespread enthusiasm and pride; as against

forces that outnumbered them, sometimes four to one and not inferior in training, in a hostile country and against formidable obstacles, both natural and artificial, the troops of Taylor and Scott won successive triumphs by the most splendid courage and the most stubborn fighting. For a detailed account, see MEXICAN WAR.

On Feb. 2, 1848, peace was signed at Guadalupe Hidalgo (q.v.). Mexico resigned her claim to Texas, agreeing to the Rio Grande as the boundary, and also ceded New Mexico and Upper California to the United States for a payment of \$15,000,000, the completion being thus attained of that great westward movement which had been going on since the Revolution.

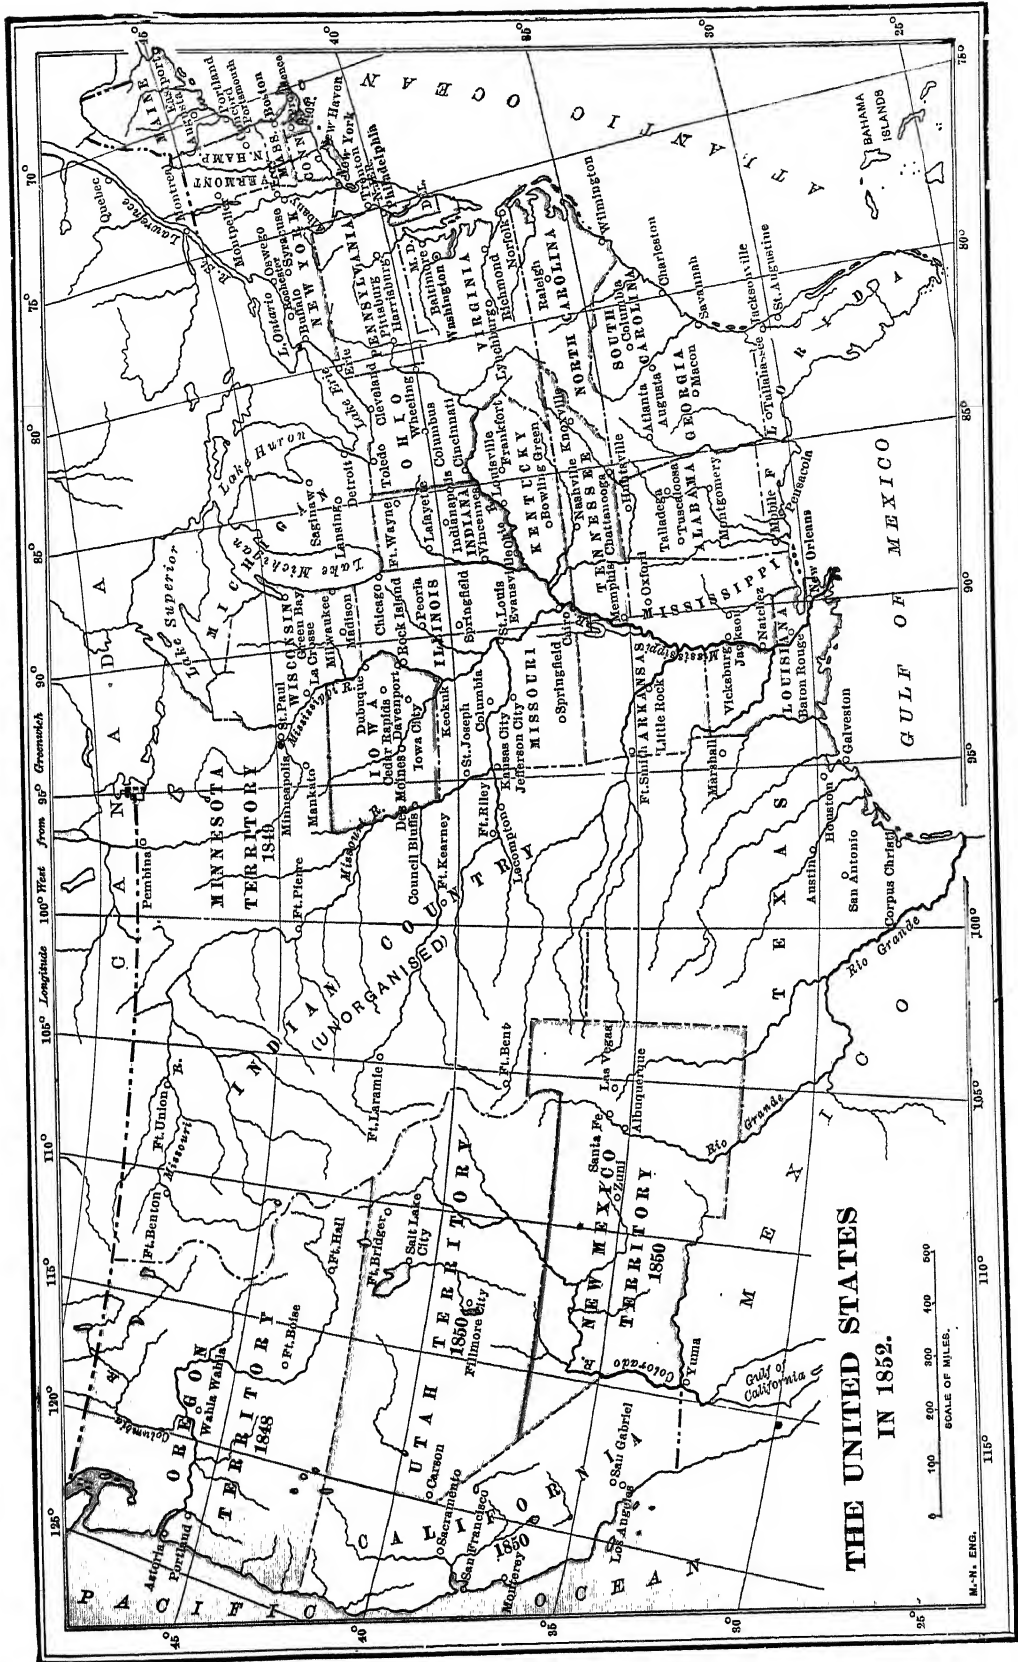

Other important events of Polk's administration were the treaty with England (June 15, 1846) by which the long-disputed question of the northwest boundary was settled (see NORTHWEST BOUNDARY DISPUTE; OREGON); the so-called tariff of 1846 (see TARIFF), which limited its purpose to the collection of revenues alone without protection to native industries; the reenactment (1846) of the Independent Treasury Act; the introduction of the Wilmot Proviso (q.v.); the formation of the Free-Soil party; the admission of Iowa (Dec. 28, 1846); the establishment of the new Territory of Oregon without slavery, and the admission of Wisconsin (May 29, 1848). It was during Polk's term also that in 1848 gold was discovered in California, that the sewing machine was patented (1846) by Elias Howe, and that the use of anesthetics was introduced in surgery. It was at this time that the great flood of Irish immigration consequent upon the potato famine of 1846 began.

The opposing candidates at the presidential election of 1848 were Lewis Cass (q.v.), of Michigan, and William O. Butler, of Kentucky, Democrats, against Gen. Zachary Taylor, of Louisiana, and Millard Fillmore, of New York, Whigs, the newly organized Free-Soil party (q.v.) nominating Martin Van Buren, of New York, and Charles Francis Adams, of Massachusetts. Taylor and Fillmore received 163 electoral votes as against 127 cast for Cass and Butler, the Democratic vote being reduced by the support given by the Barnburners (q.v.) in New York to Van Buren.

XVI. Zachary Taylor's (1849-50) and Millard Fillmore's Administration.* (1850-53.) The course of American political history from the beginning of this administration down to the Civil War is marked by a gradual disintegration of the old Whig party (q.v.), the increase in importance of the free-soil movement, culminating in the formation of the Republican party, and the development of the Democratic party into an organization whose foremost object, in so far as it was under the control of the Southern wing, was the maintenance of slavery and the perpetuation of the political power in

*CABINET.—*Secretary of State*, James Buchanan, Pennsylvania, March 6, 1845. *Secretary of the Treasury*, Robert J. Walker, Mississippi, March 6, 1845. *Secretary of War*, William L. Marcy, New York, March 6, 1845. *Secretary of the Navy*, George Bancroft, Massachusetts, March 10, 1845; John Y. Mason, Virginia, Sept. 9, 1846. *Attorney-General*, John Y. Mason, Virginia, March 9, 1845; Nathan Clifford, Maine, Oct. 17, 1846. *Postmaster-General*, Cave Johnson, Tennessee, March 6, 1845.

*CABINET.—*Secretary of State*, John M. Clayton, Delaware, March 7, 1849; Daniel Webster, Massachusetts, Dec. 6, 1850. *Secretary of the Treasury*, W. M. Meredith, Pennsylvania, March 8, 1849; Thomas Corwin, Ohio, July 23, 1850. *Secretary of War*, George W. Crawford, Georgia, March 8, 1849; Winfield Scott (ad interim), July 23, 1850; Charles M. Conrad, Louisiana, Aug. 15, 1850. *Secretary of the Navy*, William B. Preston, Virginia, March 8, 1849; William A. Graham, North Carolina, July 22, 1850; J. P. Kennedy, Maryland, July 22, 1852. *Secretary of the Interior*, Thomas H. Ewing, Ohio, March 8, 1849; A. H. Stuart, Virginia, Sept. 12, 1850. *Attorney-General*, Reverdy Johnson, Maryland, March 8, 1849; John J. Crittenden, Kentucky, July 22, 1850. *Postmaster-General*, Jacob Collamer, Vermont, March 8, 1849; Nathan K. Hall, New York, July 23, 1850; S. D. Hubbard, Connecticut, Aug. 31, 1852.

the slave States. The increase of territory out of which new States might be created made the South anxious to prevent these new States from inhibiting slavery, as would probably be done in some of them, especially in California, if the question were left to the inhabitants. The contest began actively in 1846, while the acquisition of the land in question was still doubtful. In that year David Wilmot, a Representative from Pennsylvania, brought forward a resolution providing that slavery should be excluded from all territories that might be acquired from Mexico. This, commonly called the Wilmot Proviso, was carried in the House of Representatives, but was defeated in the Senate. (See WILMOT PROVISIO.) So fierce did the strife become that many of the most thoughtful statesmen began to fear secession or civil war. In this crisis Clay, now a man of 72 and in broken health, came forward in 1850 as a peacemaker. Like Webster, who now vigorously supported him, Clay had always held a moderate position between the two extreme parties in the slavery controversy. His proposal was that no legislation concerning slavery in California, about to be admitted as a State, and in the new Territories should be enacted by Congress. He also proposed that the slave trade should be abolished in the District of Columbia, but that a stricter law for the rendition of fugitive slaves should be enacted. In September, 1850, Clay's scheme, with important changes, was put into effect by Congress by the enactment of the so-called Compromise Measures of 1850. The passage, however, of the new Fugitive Slave Law excited at the North feelings of repugnance and disgust; and several of the State Legislatures even passed laws, commonly known as Personal Liberty Laws, intended especially for the protection of negroes. See COMPROMISE MEASURES OF 1850; FUGITIVE SLAVE LAW; UNDERGROUND RAILROAD.

President Taylor died on July 9, 1850. His successor, Millard Fillmore, strictly carried out the policy of his party. The Compromise Measures were approved by the new President, and their final adoption caused a temporary lull in the contest over the question of slavery.

During the administration of President Taylor was concluded (April 19, 1850) the Clayton-Bulwer Treaty (q.v.), respecting an interoceanic canal. The secession sentiment in the South found expression in the Nashville Convention of June 9.

In June, 1852, the two great parties made their presidential nominations. The candidates of the Democracy were Franklin Pierce, of New Hampshire, and William R. King, of Alabama; the Whigs nominated Gen. Winfield Scott, of Virginia, and William A. Graham, of North Carolina. Each of the leading parties adopted a platform which recognized the "finality" of the Compromise of 1850. In August the Free-Soil party nominated John P. Hale, of New Hampshire, and George W. Julian, of Indiana. The election resulted in the success of the Democratic ticket, which received 254 electoral votes against 42 cast for the Whig nominees. The years of this administration were marked by the deaths of three of the most influential political leaders, Calhoun (March 31, 1850), Clay (June 29, 1850), and Webster (Oct. 23, 1852).

XVII. Franklin Pierce's Administration.*

*CABINET.—*Secretary of State*, William L. Marcy, New York, March 7, 1853. *Secretary of the Treasury*, James Guthrie, Kentucky, March 7, 1853. *Secretary of War*, Jef-

(1853-57.) In spite of the finality planks in the presidential campaign, the question of slavery soon came once more to the front. The leader in reviving the struggle was Stephen A. Douglas (q.v.), by whom, in January, 1854, the Kansas-Nebraska Bill (q.v.) was introduced into Congress. The Senate promptly passed this bill, and two months later it was passed by the House. (See POPULAR SOVEREIGNTY.) This led to the final disruption of the old Whig party. A new party, based on opposition to slavery, now arose in the North, whose members at first generally styled themselves Anti-Nebraska Men and which soon developed into the Republican party (q.v.). It was composed of men opposed to the extension of slavery without regard to former party affiliations—Whigs, Democrats, Know-Nothings, and Free-Soilers. The bulk of the Southern Whigs for the time being became Know-Nothings. The so-called American party, or Know-Nothings, who about this time began to exercise great influence, demanded especially more stringent naturalization laws and the election to high office of none but native-born citizens.

This virtual repeal of the Missouri Compromise, which left the new Territories to decide for themselves whether they would admit slavery or not, turned Kansas, as the Territory nearest the settled States, into a battleground for the two parties. The partisans of the North and those of the South kept pouring in fresh immigrants to outnumber the other side. At first the South was successful, and a code of laws was established with many and stringent provisions in behalf of slavery, although this was brought about, not by legitimate immigrants, but chiefly by a mob of Missourians, who passed across the border, took possession of the polling places, and carried the elections. A succession of outrages, amounting to civil war, followed, each faction establishing its own government and electing its delegate to Congress. President Pierce issued a proclamation (Feb. 11, 1856) calling for obedience to the laws and a cessation of violence and interference. Civil war, however, actually existed in Kansas. The two anti-slavery towns, Lawrence and Ossawatimie, were sacked, and the Free-Soil Legislature was twice dispersed. The outrages continued and no solution of the problem was reached during this administration. (See KANSAS.) In the meantime public sentiment was excited to a still greater intensity by the assault upon Senator Charles Sumner (q.v.), of Massachusetts, by Preston S. Brooks (q.v.), of South Carolina (May 22, 1856).

In diplomacy during this administration friction arose between the United States and Austria over the Koszta affair (q.v.), and an important treaty was negotiated by Commodore Perry with Japan, by which intercourse was first opened between that country and the Western world.

In the presidential election of 1856 the following tickets were in the field: Democratic, James Buchanan, of Pennsylvania, and John C. Breckinridge, of Kentucky; Republican, John C. Frémont, of California, and William A. Dayton, of New Jersey; Know-Nothing, Millard Fillmore, of New York, and A. J. Donelson, of Tennessee. The Democratic ticket received 174

erson Davis, Mississippi, March 7, 1853. *Secretary of the Navy*, James C. Dobbin, North Carolina, March 7, 1853. *Secretary of the Interior*, Robert McClelland, Michigan, March 7, 1853. *Attorney-General*, Caleb Cushing, Massachusetts, March 7, 1853. *Postmaster-General*, James Campbell, Pennsylvania, March 7, 1853.

electoral votes, the Republican 114, the Know-Nothing 8.

XVIII. James Buchanan's Administration.* (1857-61.) Two days after Buchanan's inauguration the Supreme Court rendered its decision in the famous Dred Scott Case (q.v.), in which the majority of the justices held that Congress had no right to prohibit slavery in any Territory and that slaves themselves were mere property whose secure possession in any Territory of the Union was guaranteed by the Constitution.

Events now succeeded one another with exciting rapidity. The sympathizers with the South had made various attempts to extend the area of slavery by the acquisition of Cuba. In 1854 the American ministers to England, France, and Spain met at the Belgian town of Ostend and there issued the so-called Ostend Manifesto (q.v.) to the effect that under certain contingencies the safety of the United States would demand the annexation of Cuba. Another attempt to acquire slave territory was through filibustering expeditions, the most famous of which were that of López to Cuba in 1851 and that of William Walker (q.v.) from 1855 to 1858 to Central America. Even the reopening of the African slave trade began to be discussed.

In September, 1857, the proslavery party in Kansas held a convention at Lecompton and proceeded to impose slavery upon the future State by submitting to the voters the alternative of voting for a clause in the Constitution *with* slavery or the Constitution *without* slavery, the instrument itself, however, affirming the right to the ownership of slaves at the time within the Territory. The antislavery party, whose Topeka Constitution had previously been disallowed by the Federal government, generally abstained from voting, with the result that the Constitution *with* slavery was adopted. (See **LECOMPTON CONSTITUTION**.) A new Territorial Legislature with an antislavery majority ordered a new election, at which the Constitution was to be accepted or rejected. It was rejected (January, 1858). The National Congress passed a bill re-submitting the Lecompton Constitution to the vote of the people, its adoption to be followed by the immediate admission of Kansas as a State. They rejected it, and thus Kansas remained a Territory. In 1859 a new convention adopted another Constitution, known as the Wyandotte Constitution, prohibiting slavery, and this, being submitted to the people, was adopted by them. Kansas, however, was not admitted as a State until 1861. The controversy in Congress over the admission of Kansas under the Lecompton Constitution proved an event of momentous importance as leading up to the division of the Democratic party in the presidential campaign of 1860. Minnesota was admitted in May, 1858, and Oregon in February, 1859. In 1858 occurred the famous Lincoln-Douglas debates (see **LINCOLN, ABRAHAM**), and a marked impression was caused by the publication of Helper's *Impending Crisis*. (See **HELPER, HIN-**

TON ROWAN.) In the following year occurred John Brown's raid on Harper's Ferry (q.v.). (See **BROWN, JOHN**.) The South approached the campaign of 1860 with the conviction that there was no place for the South in an antislavery Union, and that the success of the Republicans, even though the Republican party did not mean to interfere with slavery in the States, would mean an antislavery Union.

In the presidential election of 1860 the situation was more complicated than ever before, and finally there appeared four tickets in the field. The Northern Democrats (see **DEMOCRATIC PARTY**) nominated Stephen A. Douglas, of Illinois, and Herschel V. Johnson, of Georgia; the Southern Democrats, who had seceded from the Democratic convention, nominated John C. Breckinridge, of Kentucky, and Joseph Lane, of Oregon; a third party, the so-called Constitutional Union party (q.v.), composed of conservative members of the old Whig and Know-Nothing parties, especially powerful in the South, nominated John Bell, of Tennessee, and Edward Everett, of Massachusetts; while the Republicans (see **REPUBLICAN PARTY**) nominated Abraham Lincoln, of Illinois, and Hannibal Hamlin, of Maine. The Republican platform declared in favor of freedom in the Territories, a protective tariff, internal improvements, and a Pacific railway. In the ensuing election Lincoln received 180 electoral votes and was elected. He received every Northern vote in the electoral college, excepting three out of the seven cast by New Jersey. Breckinridge received 72 electoral votes of the South. Bell received the votes of Kentucky, Tennessee, and Virginia, 39 altogether. Douglas received only the nine votes of Missouri and three of the votes of New Jersey. The North and South were arrayed against each other, and the South was beaten. Of the popular vote, Lincoln received 1,866,452; Douglas, 1,375,157; Breckinridge, 847,953; Bell, 590,631. Thus, while Lincoln gained an overwhelming majority of the electoral votes, the combined Democratic votes exceeded his by 356,658, and the popular votes against him all together exceeded his own by 947,289. In the Southern States alone the combined vote of two of the Union candidates, Douglas and Bell, exceeded the vote of the disunion candidate, Breckinridge.

There was some ground for the claim that Lincoln was a "minority President," but the true significance of the election was the fact that political power had finally departed from the South. The slave States were at last confronted by an overwhelming opposition. The following figures from the census of each decade up to 1860 show the gradual growth of the power of the free States, the figures given for the slave States including the slaves:

YEAR	Free States	Slave States
1790.....	1,068,453	1,961,374
1800.....	2,684,616	2,021,316
1810.....	3,758,010	3,480,902
1820.....	5,152,372	4,485,819
1830.....	7,000,399	5,848,312
1840.....	9,733,022	7,334,433
1850.....	13,509,488	9,663,997
1860.....	19,128,418	*12,315,372

* Of these, about 3,500,000 were blacks.

* **CABINET**.—*Secretary of State*, Lewis Cass, Michigan, March 6, 1857; J. S. Black, Pennsylvania, Dec. 17, 1860. *Secretary of the Treasury*, Howell Cobb, Georgia, March 6, 1857; Philip F. Thomas, Maryland, Dec. 12, 1860; John A. Dix, New York, Jan. 11, 1861. *Secretary of War*, John B. Floyd, Virginia, March 8, 1857; Joseph Holt, Kentucky, Jan. 18, 1861. *Secretary of the Navy*, Isaac Toucey, Connecticut, March 6, 1857. *Secretary of the Interior*, Jacob Thompson, Mississippi, March 6, 1857. *Attorney-General*, J. S. Black, Pennsylvania, March 6, 1857; E. M. Stanton, Pennsylvania, Dec. 20, 1860. *Postmaster-General*, Aaron V. Brown, Tennessee, March 6, 1857; Joseph Holt, Kentucky, March 14, 1859; Horatio King, Maine, Feb. 12, 1861.

The South lost no time in acting upon what many of her leaders had declared would be the

signal of her withdrawal from the Union. President Buchanan's administration witnessed the culmination of the conflict that had for years been waged between the free States and the slave States. It was during this administration that the leaders of the South appear to have definitely decided that the welfare of their section could not be satisfactorily conserved while the Southern States remained a part of the Federal Union. Ever since the foundation of the government the statesmen of the South had for the most part maintained that theory of the Federal Constitution which regarded the ultimate sovereignty as residing not in the nation as a whole, but rather in the individual States themselves, which this theory—the theory of Calhoun and Hayne—held to be supreme and independent commonwealths. According to the view prevalent at the South these sovereign States had entered into a league of union with the other States for purposes of mutual advantage; and this partnership, like others, was to endure only as long as its original purpose was maintained with regard to all the members. Events seemed now to indicate that the time for the dissolution of the compact had arrived. In the first place the balance of political power was passing rapidly into the hands of a party inimical to the interests of the South, a party pledged to the ultimate abolition of slavery and to a commercial system of protection which was peculiarly unfavorable to an agricultural community such as the South then was. The greatest statesmen of the South had often deplored the presence of the slaves as an economic and social evil; yet, inasmuch as slavery actually existed, the question appeared to them a practical one rather than a matter of speculative interest. The abolitionists of the North had begun a crusade which, conducted with extreme bitterness and violence of denunciation, exasperated the South beyond measure. Men who believed thoroughly in the abstract wrongfulness of slavery indignantly took up its defense. The continual threats of the Southerners to destroy the Union, the attempts to carry out the Fugitive Slave Law, the violence to which so many of them were so ready to resort, as in the case of the assault upon Senator Sumner, and the high-handed proceedings that had marked the civil war in Kansas, all served to embitter and intensify the opposition at the North.

As soon as the result of the presidential election was known, the Legislature of South Carolina ordered a State convention, which on December 20 unanimously declared that "the Union now subsisting between South Carolina and other States, under the name of the United States, is hereby dissolved." The example of South Carolina was followed by Mississippi, Jan. 9, 1861; Florida, Jan. 10; Alabama, Jan. 11; Georgia, Jan. 19; and later by Louisiana, Texas, Virginia, Arkansas, North Carolina, and Tennessee. Kentucky and Missouri were divided.

On Feb. 4, 1861, delegates from seven seceding States met at Montgomery, Ala., and formed a provisional government, under the title of the Confederate States of America (q.v.). A provisional constitution was adopted similar in most respects to that of the United States, and the government formally inaugurated, Feb. 18, 1861, with Jefferson Davis, of Mississippi, as President, and Alexander H. Stephens, of Georgia, as Vice President, and on May 24, the seat of gov-

ernment was established at Richmond, Va. On the same day on which the Confederate delegates met at Montgomery a Peace Congress, in which 21 States were represented, assembled at Washington, but accomplished nothing. (See PEACE CONGRESS.) As State after State withdrew from the Union, its Senators and Representatives in Congress resigned their seats; and a large proportion of the officers of the army and navy of Southern birth, believing that their first and final allegiance was due to their State and that the action of each State carried with it all its citizens, also resigned their commissions.

President Buchanan, denying his constitutional power to compel the seceding States to return to the Union, though he believed that secession was unconstitutional, made a feeble and ineffectual attempt to relieve the garrison at Fort Sumter in Charleston harbor, closely besieged by the forces of South Carolina. Commissioners were sent by South Carolina to Washington to arrange for a transfer to the State of United States property lying therein and for a division of the national debt, but were not officially received. During all this time great efforts were made, but without result, to effect compromises of the difficulties. See CRITTENDEN COMPROMISE; PEACE CONGRESS.

Meanwhile, to the vacillation and incompetence of the President the prompt and vigorous action of the Southern leaders formed a striking contrast. By their direction armed forces were rapidly organized, United States arsenals and arms were seized, and batteries were planted for the reduction of such forts as threatened a firm resistance. In the last months, however, Buchanan's reorganized cabinet showed a much more determined front.

Among the events of Buchanan's administration were the Mormon Rebellion of 1857-58 (see MORMONS; MOUNTAIN MEADOWS MASSACRE), the disastrous financial panic of 1857, the discovery of silver and petroleum in the United States, and the congressional investigation of President Buchanan's connection with the Lecompton Bill (see COVODE INVESTIGATION).

XIX and XX. Abraham Lincoln's (1861-65) and Andrew Johnson's (1865-69) Administration.* On March 4, 1861, President Lincoln was inaugurated at Washington. In his inaugural address, he said: "I have no purpose, directly or indirectly, to interfere with the institution of slavery in the States where it exists. I believe that I have no lawful right to do so, and I have no inclination to do so." He also said, however: "The Union of these States is perpetual," and "No State upon its own mere motion can lawfully get out of the Union." The tension at the time was extreme and was not lessened by the vigorous efforts at conciliation which marked the

*CABINET.—*Secretary of State*, William H. Seward, New York, March 5, 1861. *Secretary of the Treasury*, S. P. Chase, Ohio, March 5, 1861; W. P. Fessenden, Maine, July 1, 1864; Hugh McCulloch, Indiana, March 7, 1865. *Secretary of War*, Simon Cameron, Pennsylvania, March 5, 1861; Edwin M. Stanton, Pennsylvania, Jan. 15, 1862; U. S. Grant (ad interim), Aug. 12, 1867; Edwin M. Stanton (reinstated), Jan. 14, 1868; J. M. Schofield, New York, May 28, 1868. *Secretary of the Navy*, Gideon Welles, Connecticut, March 5, 1861. *Secretary of the Interior*, Caleb P. Smith, March 5, 1861; John P. Usher, Indiana, Jan. 8, 1863; James Harlan, Iowa, May 15, 1865; O. H. Browning, Illinois, July 27, 1868. *Attorney-General*, Edward Bates, Missouri, March 5, 1861; Titian J. Coffey, June 22, 1863; James Speed, Kentucky, Dec. 2, 1864; Henry Stanbery, Ohio, July 23, 1866; William M. Evarts, New York, July 15, 1868. *Postmaster-General*, Montgomery Blair, Maryland, March 5, 1861; William Dennison, Ohio, Sept. 24, 1864; Alexander W. Randall, Wisconsin, July 25, 1866.

first month of his administration; and the feelings of the whole Northern people were inflamed by the bombardment on April 12-13 and the enforced surrender on April 14 of Fort Sumter in Charleston harbor. (See **FORT SUMTER**.) On April 15 President Lincoln called for 75,000 three months' volunteers, large numbers of whom were in a few days marching to the defense of Washington. After the battle of Bull Run on July 21 (see **BULL RUN, FIRST BATTLE OF**) Congress voted to call out 500,000 men.

On Jan. 1, 1862, the United States had about 576,000 men in the field, and the Confederates had about 350,000. For numbers engaged and an account of the military operations, see **CIVIL WAR** and separate articles on the various battles; and for an account of the Confederacy, see **CONFEDERATE STATES OF AMERICA**.

On July 1, 1862, the President called for 300,000 three years' men, and on August 4 for 300,000 nine months' militia for the Federal army. The United States Congress passed an Act on Aug. 6, 1861, freeing all slaves used by Confederates in military operations in the Confederacy; in April, 1862, purchased and emancipated all slaves in the District of Columbia; and on June 9, 1862, abolished slavery throughout the public domain. July 17, 1862, a second Confiscation Act followed, which it was thought might free fugitives who reached the Union lines. On Jan. 1, 1863, President Lincoln issued a proclamation in pursuance of a prior proclamation issued on Sept. 22, 1862, after the battle of Antietam (q.v.), declaring the freedom of all the slaves in the rebellious States. (See **EMANCIPATION, PROCLAMATION OF**.) The suspension of the writ of habeas corpus (q.v.), the frequent seizure of newspapers, the dispersion of public meetings, and the imprisonment without trial of opponents of the government of the North, were generally recognized as essential to the security of the nation, although the introduction of such practices gave rise to sharp criticism of the administration and furnished the opponents of its policy with ample opportunity for partisan attacks. (See **VALLANDIGHAM, C. L.**; **MILLIGAN, EX PARTE**.) The unanimity of the North was also somewhat affected by great peace meetings, while the disturbed state of the public feeling was increased by the terrible draft riots in New York in July, 1863. (See **DRAFT RIOTS IN NEW YORK**.) Business conditions became unstable, as many banks had been forced to suspend specie payments, the paper money of the United States having largely depreciated. Nevertheless, the strength of the government was not seriously impaired, the appropriations of Congress in 1863 amounting to \$972,000,000. In February of this year was passed the National Banking Act. The Confederates were cut off from all foreign aid, except such as could come to them through the blockade, and their own resources, both of men and material, in both of which respects the North was vastly superior, gradually became exhausted. The Southern railways had been in large measure destroyed or seized by the Federal troops, and it became difficult to transport supplies and to feed armies, while the North had the additional advantage of command of the sea and access to foreign markets.

In January, 1864, the United States had nearly 975,000 men raised and provided for; the entire Confederate forces probably numbered about 470,000. On April 9, 1865, the main Con-

federate army, under General Lee, surrendered to General Grant at Appomattox Court House. On April 26 General Johnston surrendered to General Sherman in North Carolina; and with the surrender of Kirby Smith in Texas, on May 26, the war was over.

In 1864 Lincoln had been reelected President and Andrew Johnson, of Tennessee, elected Vice President. The Democratic party had nominated Gen. George B. McClellan, of New Jersey, and George H. Pendleton, of Ohio, on a platform which declared the conduct of the war a failure. Lincoln received 212 electoral votes, and McClellan 21, though the disparity between the popular votes was relatively much less, Lincoln receiving (counting the votes cast by soldiers in the field) 2,330,552 and McClellan 1,835,985. Only New Jersey, Delaware, and Kentucky were carried by the Democrats. West Virginia had been admitted to the Union, June 19, 1863. See **WEST VIRGINIA**.

On April 14, 1865, while the North was rejoicing over the capture of Richmond and the surrender of General Lee, President Lincoln was assassinated at Ford's Theatre in Washington, by John Wilkes Booth (q.v.), while an accomplice attacked and severely injured Seward, the Secretary of State. Andrew Johnson thus became President.

The Thirteenth Amendment to the Constitution, forever abolishing slavery in the States and Territories of the Union, was declared ratified by two-thirds of the States, Dec. 18, 1865.

The termination of the war imposed upon Congress and the executive the duty of reconstructing the governments of the States that had seceded. This now became the most important question before the national government and for a decade dominated national politics. During Johnson's administration it involved a bitter struggle between the President and Congress, which culminated in the resolution of the House of Representatives, Feb. 24, 1868, to impeach him "of high crimes and misdemeanors." (See **JOHNSON, ANDREW; RECONSTRUCTION**.) The immediate occasion of the passage of this resolution was the course of President Johnson in violating the Tenure of Office Act (q.v.), which made requisite the consent of the Senate to removals from office by the President, and of which Congress availed itself to prevent the removal of Stanton from the position of Secretary of War. The Senate acted as the court of impeachment, and on March 23, 1868, the Chief Justice presiding, proceeded to try Andrew Johnson on 11 articles of impeachment. The result was his acquittal, the prosecution lacking the necessary two-thirds majority. It was not until 1868 that the States of Arkansas, Alabama, Florida, North and South Carolina, Georgia, and Louisiana, were readmitted into the Union. On March 1, 1867, Nebraska had been admitted as a new State. About the same time Alaska was sold to the United States by Russia.

At the election of 1868 the Republican candidates were Ulysses S. Grant, of Illinois, and Schuyler Colfax, of Indiana. The Democrats nominated Horatio Seymour, of New York, and Francis P. Blair, Jr., of Missouri. Grant and Colfax received 214 electoral votes, and Seymour and Blair 80, the Democrats having carried eight States. In this year the Fourteenth Amendment was proclaimed a part of the fundamental law. On Feb. 27, 1869, the Fifteenth Amendment to the Constitution, guaranteeing

the right of suffrage without regard to race, color, or previous condition of servitude, passed Congress and was ratified March 30, 1870.

XXI and XXII. Ulysses S. Grant's Administration.* (1869-77.) One of the most important events of President Grant's administration was the meeting of the Joint High Commission, appointed to consider the *Alabama* case (see ALABAMA CLAIMS), and which concluded the Treaty of Washington (q.v.), ratified by the Senate May 24, 1871.

Among other notable occurrences during this administration was the completion in May, 1869, of the Union and Central Pacific railroads, begun in 1865, providing a continuous line of railway from the Missouri to the Pacific and completing the transcontinental system. Out of the connection of the government with the construction of these roads—the government having given valuable subsidies in land and money to the constructing companies—arose the *Crédit Mobilier* scandal, which involved the reputation of many prominent officials and members of Congress. (See *CREDIT MOBILIER OF AMERICA*.) Tales of Southern outrages inflicted upon the freedmen, particularly in regard to the exercise by the latter of their newly acquired right of suffrage, attracted public attention (1868-72) until Congress intervened by legislation and passed several coercive acts, among which were the Enforcement Act of 1870 and the Ku-Klux Klan Act of 1871. (See KU-KLUX KLAN; RECONSTRUCTION.) Disputes arose in several of the States over contested elections, and the President intervened in Louisiana, in 1872-73, by sending Federal troops to that State, to bring about an adjustment of the difficulty, the troops supporting the Republican candidate for Governor and installing him in office. (See LOUISIANA.) In this and other instances, as well as in the suppression of the Ku-Klux Klan, the President was considered by many to have acted with undue severity towards the South. A movement was made by the government at the desire of President Grant in the direction of the acquisition of Santo Domingo, the people of that country desiring annexation to the United States, but the project was defeated in the Senate. In March, 1871, the first steps were taken towards the reform of the civil service by a bill authorizing the President to appoint a board of Civil Service Commissioners to provide for the appointment of applicants for minor offices on the basis of an examination.

During General Grant's first administration a new party arose as the result of a reaction against the extreme centralization of power in the Federal government due to the exigencies of war. This party was known as the Liberal

Republican party and numbered among its adherents some of the most prominent names in the old Republican party, such as Horace Greeley (q.v.), Charles Francis Adams, Charles Sumner, and Carl Schurz. This party nominated, in 1872, Horace Greeley, of New York, for President, and B. Gratz Brown, of Missouri, for Vice President, on a platform deprecating any further interference by the government in the local affairs of the South. (See LIBERAL REPUBLICAN PARTY; REPUBLICAN PARTY.) This ticket was ratified by the convention of the Democratic party held in the same year. The Republicans renominated General Grant, with Henry Wilson (q.v.), of Massachusetts, for Vice President. The Republican ticket received 286 electoral votes, against 66 scattering, Greeley having died before the Electoral College met. Of the popular votes Grant received 3,597,132, Greeley 2,834,125. In this election appeared for the first time the Prohibition party and a Labor Reform party, the latter being an expression of a significant movement among workmen which began during this administration and led in 1869 to the first attempt in the United States to organize on a permanent basis all kinds of manual labor. The votes of Louisiana and Arkansas and three votes from Georgia were not counted.

A serious difficulty with Spain arose because of the seizure on Oct. 31, 1872, by the Spanish steamer *Tornado* of the *Virginius*, a filibustering vessel flying the American flag, and the execution of part of her crew. See VIRGINIUS MASSACRE.

In 1873-74 the party known as Grangers or Patrons of Husbandry (see GRANGE) rose into some prominence; an Act for the resumption in 1897 of specie payments was passed in January, 1875; and an extensive Whisky Ring involving a corrupt association among distillers and Federal officers to defraud the government of the tax on liquors was exposed in the same year. (See WHISKY RING.) A new coinage Act, since denounced by advocates of free silver as the "crime of 1873," was passed providing for the coinage of gold and of fractional silver currency; an Act known as the "salary grab" was passed in 1873; and much local disorder occurred in the Southern States between the so-called "carpet-bag" governments and the white citizens, Grant interfering in what many considered a harsh and arbitrary manner. During Grant's second administration occurred the disastrous financial panic of 1873. A movement for the inflation of the paper currency was set on foot, and was checked by President Grant through his veto of the so-called Inflation Bill, which had been passed by Congress. This administration was disturbed by wars with the Modocs and Sioux, the latter of whom overwhelmed General Custer's command in 1876. (See CUSTER, GEORGE A.) In Philadelphia, between May and November, 1876, was held a mammoth exposition to commemorate the centennial of American independence. See CENTENNIAL EXHIBITION.

With Grant's administration of affairs much dissatisfaction was felt throughout the country, owing to corruption on the part of high government officials. Before the close of his first term there were many signs of reaction against Republican rule, and the organization of the Liberal Republican party showed the disaffection of a considerable element in the Republican party itself. By the close of his second term a well-defined and powerful opposition had arisen, based

* CABINET.—*Secretary of State*, E. B. Washburne, Illinois, March 6, 1869; Hamilton Fish, New York, March 11, 1869. *Secretary of the Treasury*, George S. Boutwell, Massachusetts, March 11, 1869; William A. Richardson, Massachusetts, March 17, 1873; Benjamin H. Bristow, Kentucky, June 2, 1874; Lot M. Morrill, Maine, June 21, 1876. *Secretary of War*, John A. Rawlins, Illinois, March 11, 1869; William T. Sherman, Ohio, Sept. 9, 1869; William W. Belknap, Iowa, Oct. 25, 1869; Alphonso Taft, Ohio, March 8, 1876; J. D. Cameron, Pennsylvania, May 22, 1876. *Secretary of the Navy*, Adolph E. Borie, Pennsylvania, March 5, 1869; George M. Robeson, New Jersey, June 25, 1869. *Secretary of the Interior*, Jacob D. Cox, Ohio, March 5, 1869; Columbus Delano, Ohio, Nov. 1, 1870; Zachariah Chandler, Michigan, Oct. 19, 1875. *Attorney-General*, E. R. Hoar, Massachusetts, March 5, 1869; Amos T. Akerman, Georgia, June 23, 1870; George H. Williams, Oregon, Dec. 14, 1871; Edwards Pierpont, New York, April 26, 1875; Alphonso Taft, Ohio, May 22, 1876. *Postmaster-General*, J. A. J. Creswell, Maryland, March 5, 1869; Marshall Jewell, Connecticut, Aug. 24, 1874; James M. Tyner, Indiana, July 12, 1876.

primarily on the President's apparent severity towards the South; on legislative scandals, such as the Cr  dit Mobilier affair and the "salary grab" scandal in Congress; the Whisky Ring scandal and the impeachment for corruption in distributing patronage of Belknap, Secretary of War, who resigned rather than submit to a trial; and on alleged general administrative demoralization, caused in part at least by the President's appointment, upon the advice of political leaders, of a number of unfit officials. Further discontent was caused by the consequences of the disastrous panic of 1873, for which, as was inevitable, the administration was held by many in a measure accountable. Many War Democrats, moreover, who had lent their support to the Republican party when the prosecution of the war was the all-absorbing issue, now began to return to their old party affiliations and to emphasize issues different from those immediately involved in the Republican war policy.

Colorado was admitted as a State, Aug. 1, 1876. In 1876 the Republican candidates were Rutherford B. Hayes, of Ohio, and William A. Wheeler, of New York; the Democratic candidates were Samuel J. Tilden, of New York, and Thomas A. Hendricks, of Indiana. On the face of the returns, Tilden and Hendricks seemed to have 184 electoral votes to 172 for Hayes and Wheeler, with the votes of Florida, South Carolina, and Louisiana, and one vote of Oregon in doubt. Charges were made of fraudulent voting in several States; party feeling ran so high as to suggest the possibility of acts of violence to secure control of the government; and all the attendant circumstances made the struggle one of the most momentous since the foundation of the government. Hayes and Wheeler were finally declared elected by an Electoral Commission chosen from both Houses of Congress and from the Supreme Court of the United States, whose decision was accepted by all concerned as final and irrevocable. (See ELECTORAL COMMISSION.) As thus finally decided, 185 electoral votes were given to Hayes and Wheeler and 184 votes to Tilden and Hendricks.

XXIII. Rutherford B. Hayes's Administration.* (1877-81.) The early portion of this administration was made memorable by the troubles in South Carolina and Louisiana, where rival State governments, each claiming to be legally elected, contended for supremacy. In the former State the difficulty was settled by President Hayes, who ordered the withdrawal of the United States troops which had been stationed at Columbia and had been an objectionable feature of the contest; whereupon the Republican Governor, Chamberlain, retired, and Gen. Wade Hampton took peaceful possession of the office. A settlement was also effected in Louisiana, a commission being sent thither by the President, when the Democratic Governor, Nicholls, was enabled to gain possession of his seat, the Federal troops being in this instance also withdrawn from New Or-

leans. This marked the end of Federal interference in the local concerns of the Southern States, an interference that had become yearly more objectionable to moderate men at the North, who no longer cherished the animosities resulting from the Civil War.

This year was further noteworthy by the occurrence, in July, of railroad strikes and riots throughout the country, to the injury of business and with serious loss of property. (See STRIKES AND LOCKOUTS.) The excitement occasioned by the near approach of the period fixed by Congress for the resumption of specie payments led to the formation of a party opposed to the prevailing sentiment with regard to financial questions. Such a party was organized in Toledo, Ohio, Feb. 22, 1878, under the name of the National party, delegates being present from 28 States; its principles included bimetallism, the suppression of national-bank issues, a graduated income tax, and opposition to Chinese labor. In the State elections of the same year this party, which became popularly known as the Greenback party (q.v.), polled upward of a million votes.

In February, 1878, the dissatisfaction which had been felt by the advocates of silver coinage with the Act of 1873 suspending the coinage of silver except for subsidiary coins, found expression in the passage by Congress, over the President's veto, of the so-called Bland-Allison Bill, which provided for the annual purchase by the Secretary of the Treasury of at least \$2,000,000 worth* of silver bullion to be coined into legal-tender dollars, each containing 412½ grains of standard silver. On Jan. 1, 1879, specie payments were resumed throughout the United States, after a suspension of 17 years, and in accordance with the Act of Congress approved Jan. 14, 1875, the process of resumption being effected without excitement.

An extraordinary movement northward of the colored population from certain of the Southern States took place in 1879 and was the source of much uneasiness among the planters. (See NEGRO EXODUS.) This year also saw the decline and fall of the labor agitation in San Francisco, which under the leadership of Denis Kearney (q.v.) had been continued with great virulence since 1877.

On June 2, 1880, the Republican National Convention met in Chicago to nominate candidates for President and Vice President. The names most prominent before this convention were those of Ulysses S. Grant, James G. Blaine, and John Sherman. The final choice, however, was James A. Garfield, of Ohio, with Chester A. Arthur, of New York, for Vice President. On June 11 the Greenback National Convention met in Chicago and nominated for President James B. Weaver, who was afterward accepted as the candidate of the Socialist party. On June 22 the Democratic National Convention assembled at Cincinnati, Ohio, and nominated Winfield S. Hancock, of Pennsylvania, and William H. English, of Indiana. The result of the election was the choice of Garfield and Arthur, who received 214 electoral votes, against 155 votes cast for Hancock and English.

XXIV. James A. Garfield's (1881) and Chester A. Arthur's Administration.† (1881-

*He could buy as much as four million dollars' worth if he so desired.

*CABINET.—Secretary of State, William M. Evarts, New York, March 12, 1877. Secretary of the Treasury, John Sherman, Ohio, March 8, 1877. Secretary of War, George W. McCrary, Iowa, March 12, 1877; Alexander Ramsey, Minnesota, Dec. 12, 1879. Secretary of the Navy, Richard W. Thompson, Indiana, March 12, 1877; Nathan Goff, Jr., West Virginia, Jan. 6, 1881. Secretary of the Interior, Carl Schurz, Missouri, March 12, 1877. Attorney-General, Charles Devens, Massachusetts, March 12, 1877. Postmaster-General, David M. Key, Tennessee, March 12, 1877; Horace Maynard, Tennessee, Aug. 25, 1880.

†CABINET.—Secretary of State, James G. Blaine, Maine, March 5, 1881; Frederick T. Frelinghuysen, New Jersey Dec. 12, 1881. Secretary of the Treasury, William H. Windom, Minnesota, March 5, 1881; Charles J. Folger, New York

85.) The politicians in the Republican party who had favored the election of General Grant for a third term of the presidency, popularly known, particularly in New York, as Stalwarts, had not been pleased with the nomination of Garfield, and in the presidential campaign they had been induced to give his candidacy their support only on a general understanding that the candidate if successful would give them a liberal share of patronage. The new President had in various ways shown his desire to conciliate both wings of the party; he had held many conferences with the leaders of each, and his first nominations were apparently dictated by a desire to conciliate the Stalwarts. But his appointment of William H. Robertson, who had been instrumental in securing the President's nomination at Chicago, to the post of Collector of the Port of New York aroused the opposition of the Senator from that State, Roscoe Conkling (q.v.), a leading Stalwart. Finding that his opposition was ineffectual, Conkling and his colleague, Thomas C. Platt (q.v.), resigned their seats in the Senate, May 16, 1881, and appealed to the New York Legislature for reelection as a justification of their course. The appeal was unsuccessful, and a bitter contest, lasting until the latter part of July, ended with the election of Miller and Lapham to the Senate. Meanwhile the President's appointments had been confirmed. The new Postmaster-General had discovered colossal frauds in the Star Route Service of the Postal Department, and an effort was made to bring the criminals to justice. (See *STAR ROUTE FRAUDS*.) The diplomacy of Secretary Blaine in regard to the war between Chile and Peru and the Panama Canal (q.v.) excited considerable newspaper criticism.

On July 2 President Garfield was shot by an assassin, a disappointed office seeker, Charles J. Guiteau, and after lingering for 79 days between life and death died, on September 19, at Elberon, N. J. (See *GARFIELD, JAMES A.*) On the same day in New York Vice President Arthur took the oath of office as President.

Among the national events of 1882 were the passage by Congress of the Anti-Polygamy Bill, March 22; the Apportionment Bill, increasing the number of congressional Representatives to 325; and the Anti-Chinese Bill, suspending Chinese immigration for 20 years. The last was vetoed by the President, who, however, signed a subsequent bill limiting the term of suspension to 10 years. Among the several State elections of this year, one at least had a national significance. In New York the lukewarmness of that wing of the Republican party which had sympathized with General Garfield in his contest with the leaders of the faction to which Arthur was allied, and the indignation of the Independents at the political methods pursued by President Arthur to secure the nomination and election of his friend, Charles J. Folger, as Governor of the State, resulted in the election of the Democratic candidate, Grover Cleveland (q.v.), by the immense majority of 192,000 votes.

The victory of the Democrats in Pennsylvania was also looked upon as to some extent a rebuke of the administration and especially of machine methods in politics. The question of civil service reform was now pressed with renewed eagerness by its advocates; and the so-called Pendleton Bill, which had already passed the Senate, passed the House in January, 1883, and was signed by the President. See *CIVIL-SERVICE REFORM*.

The Republican National Convention of 1884 met in Chicago during the first week of June, and the fourth ballot resulted in the nomination of James G. Blaine (q.v.) for the presidency, and of John A. Logan, of Illinois, for the vice presidency. The nomination of Blaine was secured in spite of bitter organized opposition of the Independent faction in the Republican party, popularly known as Mugwumps (q.v.). The papers which represented the views of the Independents withheld their support from Blaine and indicated that they would cast their influence on the side of the Democratic candidate in case some statesman of tried incorruptibility were chosen by the Democratic convention. It was generally understood that either Grover Cleveland or Thomas F. Bayard would be acceptable to them. When the convention met in July these two were the leading candidates on the first ballot. On the second ballot Cleveland secured the necessary two-thirds majority and was declared the nominee. Thomas A. Hendricks, of Indiana, was nominated for Vice President. Tickets were put in the field by the Prohibitionists (see *PROHIBITION*), who nominated John P. St. John, of Kansas, for President, and William Daniel, of Maryland, for Vice President; and by the Anti-Monopoly and Greenback Labor parties, both of which nominated Gen. Benjamin F. Butler (q.v.), of Massachusetts, for President. The campaign which followed developed unusual excitement, party rancor, and personal recrimination. The election was unexpectedly close, and the result for a few days hung in doubt over conflicting returns in the pivotal State of New York; but the official count gave a plurality of 1047 to Cleveland, who received 219 electoral votes, while Blaine received 182, and a popular vote of 4,874,986, while Blaine received 4,851,981. St. John had a popular vote of 150,369, and Butler a popular vote of 175,370.

XXV. Grover Cleveland's Administration.* (1885-89.) Cleveland was the first Democratic President to be chosen after the election of 1866. He was pledged to support civil-service reform. For the most part the recently established classified service was not interfered with, but partisan removals were pretty freely made in the unclassified service.

In 1886 a bill passed Congress to regulate the succession to the presidential office—a question that assumed some special importance on the death of Vice President Hendricks. Among the important congressional acts of this administration were the new Anti-Polygamy or the Ed-

Garland, Arkansas, March 6, 1885. *Postmaster-General*, William F. Vilas, Wisconsin, March 6, 1885; Don M. Dickinson, Michigan, Jan. 16, 1888.

munds-Tucker Act (1887) dissolving the Mormon church as a corporate body and confiscating all the property of that church in excess of \$50,000; the Interstate Commerce Act (q.v.) of 1887; and an Act in 1885 barring laborers brought into the United States under contract. With respect to legislation President Cleveland's administration was characterized by an unprecedented number of presidential vetoes, the number aggregating more than 300, mostly of pension bills.

In December, 1887, President Cleveland sent to Congress a message devoted to the single question of the tariff. After stating that the estimated surplus in the Treasury in June, 1888, would be fully \$140,000,000, he declared the existing tariff laws to be the source of unnecessary taxation and asked for a reduction of the duties on raw materials, especially on wool. In accordance with this recommendation the so-called Mills Bill was introduced and passed the House. It removed duties aggregating \$50,000,000 per annum, but failed to pass the Senate, which was Republican. At this session of Congress the largest appropriation for rivers and harbors ever known was made (\$22,227,000). It became law without the President's signature.

At the Democratic Convention of 1888 Cleveland was nominated for President, with Allen G. Thurman, of Ohio, as the candidate for Vice President. The Republicans nominated Benjamin Harrison, of Indiana, and Levi P. Morton, of New York. The Prohibition party candidates were Clinton B. Fisk, of New Jersey, and John A. Brooks, of Missouri. The campaign was fought out largely on the tariff questions raised by Cleveland's message of 1887. The election resulted in the choice of the Republican candidates, who received 233 electoral votes, as against 168 cast for the Democratic nominees, the popular vote for Cleveland, however (5,540,329), exceeding that of Harrison (5,439,853). The Prohibition ticket received 249,406 votes, and the Union Labor candidate, Alson J. Streeter, 146,935 votes.

XXVI. Benjamin Harrison's Administration.* (1889-93.) The administration of Harrison witnessed a remarkable growth of public interest in the foreign relations of the United States, both commercially and otherwise. One cause of this is to be found in the meeting of the so-called Pan-American Congress at Washington, Oct. 21, 1889, under the presidency of Secretary Blaine, which did much to foster a popular sentiment in favor of commercial reciprocity between the United States and the other American republics. This policy, warmly advocated by Blaine, found expression in the so-called "reciprocity section" of the important bill for the revision of the tariff prepared by William McKinley (q.v.), of Ohio, which passed both Houses of Congress and became a law Oct. 1, 1890. For other provisions of the bill, see **TARIFF**.

Several diplomatic difficulties of more or less seriousness had arisen between the United States and foreign Powers within a few years. Among these had been complications growing out of a state of anarchy on the Isthmus of Panama, the

United States government, in accordance with its treaty obligations, being required to send an armed force to protect the isthmus. A dispute with Germany over the Samoan Islands (q.v.) in 1889 had also taken a serious aspect, though finally arranged in an amicable manner by a treaty signed at Berlin (Feb. 4, 1890). A serious disagreement with England also arose in 1890-91 regarding the rights of the United States acquired in Bering Sea by treaty with Russia, and was referred to arbitration in 1891. The question was finally settled in 1893. (See **BERING SEA CONTROVERSY**.) The lynching of several Italians by a mob in New Orleans in 1891 led to something like a diplomatic rupture with Italy, which recalled its Minister from Washington. In October, 1891, difficulties arose with Chile in consequence of a murderous assault upon American seamen in Valparaiso.

In November, 1889, four States (North Dakota, South Dakota, Montana, and Washington) were admitted into the Union. On May 2, 1890, the new Territory of Oklahoma (q.v.) was organized, and Idaho (July 3) and Wyoming (July 11) were admitted as States. Other events of importance during Harrison's administration were the passage in 1890 of the Dependent Pension Bill, which nearly doubled the number of pensioners; the repeal of the Bland-Allison Silver Coinage Act; the passage of the Sherman Silver Purchase and Coinage Act, requiring the Secretary of the Treasury to purchase 4,500,000 ounces of silver each month and to coin 2,000,000 ounces into silver dollars each month until July 1, 1891; and the labor disturbances at Homestead, Pa.

The close of Harrison's administration witnessed a serious financial panic. An event of international importance was the overthrow of the monarchy in Hawaii by the foreign residents, and the application made by the new government for annexation of the islands to the United States. The President sent a treaty of annexation to the Senate (February, 1893), but it was not acted upon. See **HAWAIIAN ISLANDS**.

The conventions of the two great political parties had been held in June, 1892. The Democrats nominated Grover Cleveland, of New York, for the presidency, and Adlai E. Stevenson, of Illinois, for the vice presidency. The Republican Convention renominated President Harrison for the presidency and selected Whitelaw Reid, of New York, for the vice presidency. The People's party, or Populists, nominated Generals J. B. Weaver, of Iowa, and James G. Field, of Virginia. The ensuing campaign was largely conducted on the question of the tariff and resulted in the election of Cleveland and Stevenson, who received 277 electoral votes as against 145 for Harrison and Reid and 22 for Weaver and Field.

XXVII. Grover Cleveland's Second Administration.* (1893-97.) In his second administration the President applied himself particularly to the promotion of tariff and financial reforms, and this period was marked by the intense and persistent opposition of his own party

***CABINET**.—*Secretary of State*, James G. Blaine, Maine, March 7, 1889; John W. Foster, Indiana, June 29, 1892; W. F. ***CABINET**.—*Secretary of State*, Walter Q. Gresham, Indiana, March 6, 1893; Richard Olney, Massachusetts, June 10, 1895. *Secretary of the Treasury*, John G. Carlisle, Kentucky, March 6, 1893. *Secretary of War*, Daniel S. Lamont, New York, March 6, 1893. *Secretary of the Navy*, Hilary A. Herbert, Alabama, March 6, 1893. *Secretary of the Interior*, Hoke Smith, Georgia, March 6, 1893. *Attorney-General*, Richard Olney, Massachusetts, March 6, 1893; Judson Harmon, Ohio, June 8, 1895. *Postmaster-General*, Wilson S. Bissell, New York, March 6, 1893; William L. Wilson, West Virginia, March, 1895. *Secretary of Agriculture*, J. Sterling Morton, Nebraska, March 6, 1893.

in both Houses of Congress. His earliest act of importance was the withdrawal from the Senate of the treaty for the annexation of Hawaii to the United States, which had been negotiated in the closing days of the previous administration. He also sent James H. Blount, ex-Congressman from Georgia, to Hawaii as a special commissioner to investigate the circumstances of the overthrow of the royal government, and on his report took the ground that the United States government had through its representatives committed a grievous wrong against the Kingdom. See HAWAIIAN ISLANDS.

The legislation on the tariff was the most important domestic incident of this term. A new bill, bearing the name of Chairman Wilson, of the House Committee on Ways and Means, and providing for free raw sugar, free wool, free coal, free lumber, and free iron ore, and reducing the duties on many articles in the existing schedules, was introduced Dec. 19, 1893. In the following month a measure providing for an income tax was presented in the House, and that and others concerning the internal revenue were incorporated in the bill during the subsequent debate. When the bill reached the Senate it underwent radical alterations, many amendments being made, notably those imposing a duty on sugar, coal, and iron ore, and the House at first refused to concur in the Senate amendments. Finally, however, it withdrew from its position of nonconcurrence, and the bill was passed. (See *TARIFF*.) The President allowed the bill to become a law without his signature. On an appeal to the United States Supreme Court, that body, April 2, 1893, declared two provisions of the income-tax law unconstitutional and upheld the remainder by a tie vote, and on May 20, on a rehearing, declared the whole measure unconstitutional.

Early in the term occurred the great commercial panic of 1893, which was followed by a long period of depression. President Cleveland was determined to maintain the gold standard and in the summer of that year called an extra session of Congress in order to secure the repeal of the Sherman Act of 1890. This he accomplished in the face of great opposition. In January, 1894, because of the heavy withdrawal of gold coin from the Treasury and the large reduction in the gold reserve of \$100,000,000, Secretary Carlisle, of the Treasury Department, invited proposals for the purchase of \$50,000,000 of 5 per cent bonds, and this sale resulted in the acquisition of \$58,660,917 in gold, which was added to the reserve. The drain on the reserve, however, continued, and in November following the Secretary issued a second call for the purchase of \$50,000,000 bonds, when the subscriptions aggregated \$178,341,150 and the sale yielded \$58,538,500 in gold, which brought the reserve to \$111,142,021. In about two months after this sale the reserve declined to \$41,340,181. The President, in a special message to Congress, Jan. 28, 1895, recommended that authority be given the Secretary of the Treasury to issue bonds bearing a low rate of interest, to maintain the reserve and redeem outstanding notes issued for the purchase of silver; but Congress did not approve the recommendation. Secretary Carlisle then signed a contract with New York bankers to supply the government with 3,500,000 ounces of standard gold coin, at the rate of \$17.80441 per ounce, for 30-year 4 per cent bonds, on condition that one-half of the coin should be obtained in Europe,

VOL. XXII.

and that if Congress should authorize their issue, bonds payable in gold and bearing 3 per cent interest might within ten days be substituted at par for the 4 per cent bonds. The President again urged Congress to authorize the issue of low-rate bonds, declaring in his message that more than \$16,000,000 in interest would be saved thereby, and Congress again withheld its sanction. Under the contract the Secretary sold \$62,315,000 in bonds for a little over \$65,000,000 in gold. The subscriptions to this loan aggregated \$590,000,000 in London and \$200,000,000 in New York. Under the continuance of the business depression Secretary Carlisle was forced early in 1896 to sell \$100,000,000 of 30-year 4 per cent bonds.

The silver question came up again in Congress, Feb. 7, 1894, when the House Committee on Coinage, Weights, and Measures reported a bill directing the coinage of the silver held in the Treasury. A substitute by Congressman Bland providing for the coinage of the seigniorage was adopted and passed in the House and the Senate. This bill was vetoed by the President, and it failed of passage over the veto. In December, 1895, the House passed a bond bill prepared by the Republican members of its Committee on Ways and Means, and when it reached the Senate the Finance Committee reported a free-silver-coinage substitute, which the Senate passed, Feb. 1, 1896, by a vote of 42 yeas to 35 nays. The House refused to concur in the substitute and rejected it by a vote of 215 yeas to 90 nays. A few days afterward the Senate defeated the Emergency Revenue Bill, prepared by Republican members of the House Committee on Ways and Means.

A long-standing dispute between Venezuela and Great Britain, over the boundary line between Venezuela and British Guiana, was the cause of a presidential message to Congress in December, 1895, recommending the appointment of a commission to determine this boundary line. This message, on account of its sharp and determined tone towards Great Britain, created a great sensation. Both Houses unanimously concurred in the recommendation, and a commission was appointed Jan. 1, 1896. (See *VENEZUELA*.) Among other events of President Cleveland's second administration were the World's Columbian Exposition at Chicago, the settlement of the Bering Sea controversy (q.v.) in 1893, the signing of treaties with China and Japan in 1894, the extension by the President of civil-service reform (q.v.), the calling out of Federal troops to protect government property and the mails against strikers at Chicago in 1894, the admission of Utah into the Union in 1896, and the arbitration by the President of disputes between Brazil and the Argentine Republic, Colombia and Italy, and Brazil and Italy.

The presidential campaign of 1896 turned principally on the Democratic demand for the free coinage of silver at the ratio of 16 to 1. There were seven tickets in the field, viz., the Republican (sound money), William McKinley, of Ohio, and Garret A. Hobart, of New Jersey; the Democratic (free silver), William J. Bryan, of Nebraska, and Arthur Sewall, of Maine; the National Democratic (sound money), John M. Palmer, of Illinois, and Simon B. Buckner, of Kentucky; the Prohibition, Joshua Levering and Hale Johnson; the Socialist Labor, Charles H. Matchett and Matthew Maguire; the Populist, William J. Bryan and Thomas E. Watson; and the Free Silver Prohibition, Charles E. Bentley

and James H. Southgate. The total popular vote was 13,930,942, and the electoral, 447, of which the Republican candidates received 7,104,779 and 271 respectively, and the Democratic, 6,502,925 and 176. The Populist ticket received 144,928 votes; National Democratic, 134,731; Prohibition, 123,428; Socialist Labor, 35,306; and Free Silver Prohibition, 13,535.

XXVIII and XXIX. **William McKinley's** (1897-1901) and **Theodore Roosevelt's Administration**.* (1901-09.) President McKinley's administration was concerned chiefly with the war against Spain and with problems growing out of the war and the acquisition of the Philippines and Porto Rico. These subjects are treated under **SPANISH-AMERICAN WAR; CUBA; PHILIPPINE ISLANDS; PORTO RICO**. The Spanish-American War, with its consequent acquisition of colonies and dependencies, marks a momentous epoch in the history of the United States. It brought the country into a more active contact with world politics; it caused a far greater activity in military preparation and national defense; it directed attention to the interests of colonizing nations and to international trade, opening up new commercial possibilities; it made the political and economic conditions of the Orient the concern of the United States; and it made imperative the construction of the Panama Canal. In the war there was a manifestation of the national unity which had already been achieved.

Congress and the Supreme Court successively held that constitutional did not necessarily follow colonial sovereignty, that acquired nationals did not become citizens of the United States with attendant rights. In the Insular cases (*De Lima v. Bidwell*, *Downes v. Bidwell*) the Supreme Court in 1900 decided that Porto Rico was not a "foreign country," but left the inference that Congress could regulate the tariff relations of dependencies, which the Foraker Act (April, 1900) forthwith regulated.

Under joint resolution of Congress Hawaii was annexed to the United States in 1898, and on June 14, 1900, the islands were organized into a Territory of the United States. See **HAWAIIAN ISLANDS**.

Owing to disturbances in Samoa in 1899, the existing joint protectorate was abandoned, and Tutuila (q.v.) and other minor islands passed (1900) under the sovereignty of the United States, Germany assuming like rights over Saraii and Upolu.

The organization of trusts continued with increasing rapidity. During the first four months of 1899 the capitalization of these trusts was

\$2,900,000,000 as against \$1,000,000,000 in the preceding 12 months, and, in the years 1899-1901, 183 new trusts were organized with a total capitalization of \$4,000,000,000. There developed a strong antitrust movement, which resulted in a large number of State laws regulating the formation and operation of large industrial combinations. In the case of *United States v. Trans-Missouri Freight Association* (1897) the Supreme Court forced the dissolution of a railroad association and gave an impetus to the antitrust movement. (See **TRUSTS**.) For the Boxer disturbances, see **CHINA**.

In 1900 occurred the Galveston flood, which resulted in great loss of life and in the new idea of municipal government—the commission form. At the Republican National Convention held on June 19 at Philadelphia President McKinley and Theodore Roosevelt were nominated by acclamation and the principles of 1896 reaffirmed. The nominee stood for prosperity, and the party for an alliance between business and politics. On July 4 the Democratic Convention at Kansas City nominated William J. Bryan and Adlai E. Stevenson and declared again for free silver and against imperialism and militarism. (See **DEMOCRATIC PARTY**.) The Democratic nominees received the indorsement of the Anti-Imperialist League, the Populist Fusionists, and the Silver Republicans. The election resulted in a complete victory for the Republicans, McKinley receiving 292 electoral votes and Bryan 155. The popular vote of the Republicans was 7,219,530 and that of the Democrats 6,358,071.

While receiving the people in the Temple of Music at the Pan-American Exposition at Buffalo, President McKinley was shot down by an anarchist, named Czolgosz (q.v.), on Sept. 6, 1901. After eight days of suffering the President died at Buffalo. Vice President Roosevelt took the oath of office. He retained the cabinet and announced his intention to continue the policy of the previous administration.

In 1900 a currency law was adopted, establishing the gold dollar as the standard of value in the United States. In 1901 the army (see *Army*) was reorganized and the canteen (q.v.) abolished. The Fifty-seventh Congress passed a new Chinese Exclusion Bill, and an Act for reclaiming and irrigating arid lands of the West. In 1902 the Census Office was made a permanent bureau. In 1903 a reciprocity treaty was concluded with Cuba. (See **CUBA; PLATT, O. H.**) In 1903 a new Department of Commerce and Labor was created, the Secretary being made a member of the cabinet. A Bureau of Manufactures and Corporations was established, with functions of investigation. Laws for the reorganization of the militia and increase of the navy were passed. A general staff for the army was created. In 1903 Wisconsin adopted the first State-wide primary-election law for the nomination of elective officials. By 1913 two-thirds of the States had adopted the principle in some form. In 1902 Oregon adopted the initiative and referendum, Montana in 1906, and Oklahoma in 1907.

A convention on the Isthmian question was ratified by Great Britain and the United States on Dec. 16, 1901. (See **HAY-PAUNCEFOTE TREATY**.) For an account of the relations between the United States and Colombia and the Republic of Panama, see **PANAMA CANAL**.

There occurred a number of strikes, a most noteworthy development of one being the appointment by the President in October, 1902, of

***CABINET**.—*Secretary of State*, John Sherman, Ohio, 1897; W. R. Day, Ohio, 1898; John Hay, Ohio, 1898; Elihu Root, New York, 1905; Robert Bacon, New York, 1909. *Secretary of the Treasury*, Lyman J. Gage, Illinois, 1897; Leslie M. Shaw, Iowa, 1901; George B. Cortelyou, New York, 1907. *Secretary of the Navy*, John D. Long, Massachusetts, 1897; William H. Moody, Massachusetts, 1902; Paul Morton, Illinois, 1904; C. J. Bonaparte, Maryland, 1903; V. H. Metcalf, California, 1907; T. H. Newberry, Michigan, 1908; *Secretary of War*, Russell A. Alger, Michigan, 1897; Elihu Root, New York, 1899; W. H. Taft, Ohio, 1904; Luke E. Wright, Tennessee, 1908. *Secretary of the Interior*, Cornelius N. Bliss, New York, 1897; E. A. Hitchcock, Missouri, 1899; James R. Garfield, Ohio, 1907. *Postmaster-General*, James A. Gary, Maryland, 1897; Charles Emory Smith, Pennsylvania, 1898; Henry C. Payne, Wisconsin, 1901; Robert J. Wynne, Pennsylvania, 1904; George B. Cortelyou, New York, 1905; George von L. Meyer, Massachusetts, 1907. *Attorney-General*, Joseph McKenna, California, 1897; J. W. Griggs, New Jersey, 1897; Philander C. Knox, Pennsylvania, 1901; William H. Moody, Massachusetts, 1904; Charles J. Bonaparte, Maryland, 1907. *Secretary of Agriculture*, James Wilson, Iowa, 1897. *Secretary of Commerce and Labor*, George B. Cortelyou, New York, 1903; Victor H. Metcalf, California, 1904; Oscar S. Straus, New York, 1907.

a commission to arbitrate the differences between the striking anthracite miners of Pennsylvania and their employers which effected a settlement and averted a coal famine.

After tedious negotiations, in January, 1903, Secretary Hay and the British Ambassador signed a convention for the settlement of the Alaskan boundary dispute providing for its reference to a tribunal of six jurists. On Oct. 17, 1903, the tribunal decided the main points of the controversy in favor of the United States, the decision being signed by the three American arbitrators, Lodge, Root, and Turner, and by the English arbitrator, Lord Alverstone. The refusal of the two Canadian members to agree with the majority was strongly approved in Canada, where the decision was received with marked evidences of dissatisfaction.

In the presidential election of 1904 the Republicans were again successful, and President Roosevelt was elected by an enormous majority of electoral votes (336 to 140). The Republican National Convention met at Chicago, nominated Theodore Roosevelt for the presidency and Charles W. Fairbanks for the vice presidency, and adopted a platform eulogizing the administration and reaffirming the principles of the previous platforms of 1896 and 1900. The Democratic National Convention met at St. Louis, and its sessions were marked by a bitter contest between the conservative wing and the radical wing, which latter had been dominant in 1896 and 1900. The former triumphed, and a platform was adopted which (as a concession to the radicals) was silent on the "gold standard," arraigned the Republican administration as being "spasmodic, erratic, sensational, spectacular, and arbitrary," declared against imperialism, protection, and "executive usurpation," and advocated reciprocity and "the election of United States Senators by direct vote of the people." Alton B. Parker, of New York, was nominated for the presidency, and Henry G. Davis, of West Virginia, for the vice presidency. Other parties nominated candidates for President and Vice President as follows: Socialist, Eugene V. Debs, of Indiana, and Benjamin Hanford, of New York; Prohibitionist, Silas C. Swallow, of Pennsylvania, and George W. Carroll, of Texas; People's, Thomas E. Watson, of Georgia, and Thomas H. Tibbles, of Nebraska; Socialist Labor, Charles H. Corrigan, of New York, and William W. Cox, of Illinois. The record of President Roosevelt since his accession to the presidency was the principal issue. The popular vote was as follows: Republican, 7,628,834; Democratic, 5,084,491; Socialist, 402,460; Prohibitionist, 259,257; People's, 114,753; Socialist Labor, 33,724. Parker carried only the Solid South, Missouri excepted.

President Roosevelt's administration was marked by the especial activity of the Federal government against combinations in restraint of trade, discriminations by interstate carriers, and the payment by railroads of rebates to favored shippers. The Bureau of Corporations and Manufactures and the Interstate Commerce Commission conducted investigations into the management of various corporations. As a result suits were brought by the government, and the Northern Securities Company, a holding company for the Great Northern and Northern Pacific railroads, was declared illegal and dissolved by the Supreme Court in 1904, and the Beef Trust was declared illegal in 1905. On March 12, 1906, the Supreme Court decided that in antitrust pro-

ceedings witnesses might be compelled to testify against their own corporations; in August the Standard Oil Company was indicted in Chicago and in New York for receiving rebates and for accepting illegal concessions in railroad rates; and in October the New York Central and Hudson River Railroad was convicted in New York of granting illegal rebates. Other similar convictions were secured.

The sessions of the Fifty-ninth Congress were marked by important legislation. The Hepburn Rate Bill for the regulation of railroads and conferring power of rate making (subject to review of the courts) upon the Interstate Commerce Commission became a law on June 29, 1906; and on June 30 a rigid meat-inspection bill, passed to make a continuation of the revolting conditions in the Chicago packing houses impossible, and a pure-food bill were signed, the last going into effect on Jan. 1, 1907.

Other legislation of importance for 1906-07 may be briefly summarized: Alaska was allowed a delegate in Congress; a Bureau of Immigration was established; naturalization was made uniform; Japanese immigration was restricted; national-bank liabilities were limited to 30 per cent of capital; salaries of Vice President, cabinet members, and Speaker were increased to \$12,000 and those of Congressmen to \$7500; corporations and national banks were forbidden to contribute to campaign funds, the Aldrich-Vreeland Act (1908) provided for a monetary commission and allowed banks to issue notes on State, county, or municipal bonds and to form associations for issuance of notes on commercial paper; the consular service was reorganized.

In April, 1906, occurred the San Francisco earthquake and in August the Brownsville Affair, in which negro soldiers were involved and a racial question presented in politics by their dismissal by President Roosevelt.

Through the President's good offices a meeting of Russian and Japanese peace commissioners at Portsmouth, N. H., was brought about, and a treaty of peace was concluded on Sept. 5, 1905; a Pan-American Conference in which the United States participated was held at Rio de Janeiro, Brazil. (See ROOT, ELIHU.) Owing to an insurrection in Cuba, the United States intervened, restored order, and on Sept. 29, 1906, established a provisional government, Secretary of War Taft acting as provisional Governor until succeeded on October 13 by Charles F. Magoon. In February, 1907, the treaty with Santo Domingo was ratified whereby United States officers were to collect customs revenues and pay Dominican foreign debts.

On Nov. 30, 1908, the Root-Takahira note set at rest some of the fears that relations with Japan might become hostile. It stated, following treaties between Japan and England, France and Russia, that the policy of both governments looked towards peace, the maintenance of the status quo in the Pacific Ocean and the Orient and of the "open door" in China, and pledged both governments to mutual consultation before these policies should be changed.

Roosevelt's administration was also a period of constant agitation of reform questions in which he and Republican conservatives became alienated. The President's attitude became sharp and bitter, and opposition to him became more virulent. The House generally followed him, but the Senate sought to check what many thought his overreaching ambition. Certain developments in the struggle seemed to prove that many

conservative Senators were identified with the moneyed interests, that the powerful party organization in the Senate was formed in the interests of the trusts. The results were that many of the Roosevelt policies were ignored by Congress and that there arose a demand for the popular election of Senators.

It was generally known that President Roosevelt favored Secretary of War Taft as his successor. His indorsement and assistance greatly aided Taft's candidacy, which was opposed only by "favorite sons" in New York, Pennsylvania, Indiana, and Illinois. The Republican National Convention met at Chicago, where Taft was nominated for the presidency and James S. Sherman, of New York, for the vice presidency on first ballots. The platform emphatically indorsed the administrations of Roosevelt and declared for postal-savings-bank system, for conservation, and for a downward revision of the tariff with the imposition of such "duties as will equal the differences between the cost of production at home and abroad, together with a reasonable profit to American industries." Public opinion was equally certain as to the outcome of the Democratic Convention, which met at Denver. The overwhelming defeat of the conservatives in 1904 and the reawakened consciousness of the necessity for internal reform caused the party to turn to its old radical leader, William J. Bryan. He was nominated on the first ballot, and J. W. Kern, of Indiana, was selected for the vice presidency. The platform was a reassertion of Bryan principles, a denunciation of Republican abuses, and a demand for divorce of business and politics, for a diminution of the powers of the Speaker of the House of Representatives, for a revision of the tariff, and for a Federal license for corporations which prohibited duplication of directors. The Socialists nominated Eugene V. Debs, of Indiana, and Benjamin Hanford, of New York; the Socialist Labor, A. Gilhaus, of New York, and D. L. Munro, of Virginia; the Prohibitionists, E. W. Chafin, of Illinois, and A. S. Watkins, of Ohio; the Populists, Thomas E. Watson, of Georgia, and S. W. Williams, of Indiana; the Independence League, T. L. Hisgen, of Massachusetts, and J. T. Graves, of Georgia. The campaign was unexciting, and, although the reception of Bryan was enthusiastic, it was generally thought that Taft would be elected. The vote in the Electoral College for Taft was 321 to 162 for Bryan, and the popular vote was 7,679,006 for Taft to 6,409,106 for Bryan.

XXX. William Howard Taft's Administration.* (1909-13.) In accordance with the promise of the platform President Taft after his inauguration summoned the Congress into extraordinary session to revise the tariff. The framers, Payne and Aldrich, were leaders of the conservative, "stand-pat" element of the party in the House and Senate respectively, and the bill showed their opposition to any violent change in the policy of protection. As finally adopted (August 5), the Payne-Aldrich Law reduced 654 rates, increased 220, and left 1150 unchanged. The Law provided for the establishment of a tariff board to investigate the

operation of the measure and to recommend changes, for a tax of 1 per cent upon incomes of corporations earning above \$5000 net, and for free trade with the Philippines. Much against the wishes of the insurgent Western leaders and admitting that the Act did not strictly comply with the pledges, Taft approved it. Although the President in a speech at Winona, Minn., stated that the Act was the best tariff law his party had ever adopted, the general opinion was that the conservatives had triumphed and that the wishes of the people had not been regarded. Whether he desired or not, the President became identified with the conservatives, and the Ballinger-Pinchot (qq.v.) controversy (August, 1909) seemed to confirm this association. See CONSERVATION.

In 1910, through a coalition of Democrats and insurgents, the power of Speaker Cannon to control the Rules Committee and debate in general was broken in a dramatic parliamentary struggle. A resolution, introduced March 10, provided for the elimination of the Speaker from the committee and the appointment of it by the House.

The important measures of the regular session, passed in 1910, may be summarized as follows: a Commerce Court was established to pass upon cases investigated by the Interstate Commerce Commission; a postal-savings-bank system was created; the publication of campaign expenses in Federal elections was required; the powers of the Interstate Commerce Commission were enlarged in a new railroad bill; the Mann "White Slave" Act was adopted; and in 1911 a limit was placed on contributions to campaign funds for Congressmen.

The division in the Republican party was further intensified by the ill-concealed sympathy of Roosevelt, who had returned from Africa on March 21, 1910, for the radical insurgents. (See ROOSEVELT.) Owing to this widening breach, to the development of new leaders, and the widespread discontent with the tariff law, the Democrats, in the election of 1910, won a notable victory, carrying the House by a majority of 66 and increasing their membership in the Senate from 32 to 41. The Democrats in the House of Representatives made a fundamental change in procedure by having committee members elected by the House on nomination of the Committee on Ways and Means.

On Jan. 26, 1911, the President submitted the outline of the Canadian Reciprocity Treaty which he had negotiated in an attempt to conform to his tariff pledges. It provided for lower duties on many food products and some manufactured articles, and it became a popular measure. For success, however, it soon developed that it depended upon Democratic votes in both Chambers. Congress, in extra session, passed the Reciprocity Bill on July 22. At the same time the Democratic party, led with skill by Oscar W. Underwood and aided by the insurgents, adopted tariff bills revising several schedules, viz., the Farmer's Free List, the Wool Bill, and the Cotton Bill, all of which were vetoed by the President on the ground that they were not scientifically drafted on the recommendation of the tariff board. Taft's hopes for Canadian reciprocity were blasted when, on September 21, Canada defeated ratification. The conservatives were further weakened before the public by the Lorimer scandal. (See LORIMER.) Charged with use of bribery in securing his election, he was exonerated in 1911, but in 1912 his seat

* **CABINET.**—*Secretary of State*, P. C. Knox, Pennsylvania, 1909. *Secretary of the Treasurer*, Franklin MacVeagh, Illinois, 1909. *Secretary of War*, J. M. Dickinson, Tennessee, 1909; H. L. Stimson, New York, 1911. *Secretary of the Navy*, George von L. Meyer, Massachusetts, 1909. *Secretary of the Interior*, R. A. Ballinger, Washington, 1909; W. L. Fisher, Illinois, 1911. *Postmaster-General*, F. H. Hitchcock, Massachusetts, 1909. *Attorney-General*, G. W. Wickersham, New York, 1909. *Secretary of Agriculture*, James Wilson, Iowa, 1909. *Secretary of Commerce and Labor*, Charles Nagel, Missouri, 1909.

was declared vacant. This scandal, the popular disapproval of the obstructive methods of the conservative Senate, and the prolonged deadlocks in several State Legislatures where Senators were to be elected, gave such an impetus to the demand for the popular election of Senators that a constitutional amendment (the Seventeenth) to that effect was submitted (1912) to the States and ratified (1913). In 1913, also, the States ratified the Sixteenth Amendment (submitted 1911), granting authority to Congress to enact income-tax laws, which had been recommended by Taft in 1909.

In 1911 the Supreme Court gave important decisions holding that the Standard Oil and American Tobacco companies had conducted their business in unreasonable and undue restraint of trade and that they should be dissolved into their original, constituent elements. In 1911, also, Senator Aldrich submitted the plan of the monetary commission for currency reform, providing for the Federal incorporation of a Reserve Association with \$300,000,000 capitalization. Favored by most bankers, it was suspiciously opposed by the public because of the dominance of private control provided in the scheme.

Important legislation of the Sixty-first Congress may be mentioned as follows: an Act for the government of the Panama Canal zone provided for the exemption from tolls of American ships engaged in coastwise trade; an Act providing civil government for Alaska; New Mexico and Arizona were admitted as separate States (1912); an Immigration Law having a literacy test was vetoed by the President; a Law creating the Department of Labor with a secretary of cabinet rank was adopted (1913); and the Commerce Court was destroyed by withholding maintenance funds (1913). During this Congress there were numerous investigations, such as that of the Money Trust, the Shipping Trust, and the Steel Trust. See PUJO; TRUSTS.

In 1909 the United States forces of occupation were withdrawn from Cuba, and the civil government surrendered in accordance with promises. In that year, also, the long-standing differences with Venezuela were peacefully settled in that the Gómez government, more amenable than that of the deposed Castro, agreed to a reference to The Hague for arbitration. Diplomatic intercourse between the two countries was resumed. The United States was greatly aroused, in December, 1909, over the execution of two Americans by the Zelaya government of Nicaragua, against which a successful revolution was being waged.

In 1910 Secretary Knox proposed to the various nations the establishment of a permanent court of arbitral justice at The Hague. At the same time he and the President were negotiating arbitration treaties with the principal European nations. Those with Great Britain and France attracted wide attention, for they provided for peace and arbitration of any questions "justiciable in their nature" that might arise. These treaties, signed Aug. 3, 1911, enlisted the enthusiastic support of the President, who spoke for them while on tour, but they were not satisfactory to the Senate, where they were thought to deprive it of its constitutional right in ratifying treaties. The treaty had provided that in case of disagreement as to whether or not a matter was subject to arbitration the question should be placed before a joint commission and the matter submitted to arbitration or not, ac-

cording to its decision. Striking out this article, the treaties were ratified March 7, 1912.

In September, 1912, the Alsop claims between United States and Chile were decided. In December, 1911, the subsisting treaty of 1832 with Russia was abrogated, because of the disregard by Russia of American passports issued to naturalized Jews. From 1910 to 1913 President Taft was greatly concerned with the complications arising from the revolutions in Mexico against Díaz and later Madero. Large forces of American soldiers were detailed to patrol the border and maintain neutrality, and warships were sent to many of the Mexican harbors. The administration was opposed to intervention, but still sought to protect American interests and lives. Finally, in March, 1912, Congress authorized the President to place an embargo on the shipment of arms across the border into Mexico. Taft declined to recognize the Huerta government, which succeeded that of Madero in February, 1913.

In 1912 there was a rumor that Mexico was about to sell a portion of Magdalena Bay territory to Japanese interests. This led to the adoption of the Lodge Resolution in July, which effected an extension of the Monroe Doctrine to the effect that the United States would oppose the selling by American nations of lands to foreign corporations which might be used as naval bases to threaten the communications and safety of the United States.

Secretary Knox, with respect to the Orient, insisted on the maintenance of the "open door" policy and secured in 1912 the right of the United States financiers to participate in a proposed loan to China and in the financing of projected railways.

In the presidential campaign of 1912 three Republicans were prominent in seeking the nomination, Taft, Roosevelt, and La Follette (qq.v.). The last, though at first supported by Roosevelt, was eliminated by illness, unpopularity in the East, and by Roosevelt's candidacy. In the pre-convention contest for delegates preferential primaries were used in many States for the first time for the selection of delegates, and in all but three of such States Roosevelt was successful. The convention met at Chicago, where the contested seats were largely decided in favor of Taft delegates. (See ROOT; ROSEWATER.) Roosevelt declared the decisions were a "clear steal," and most of his followers declined to take part in the balloting. Taft was nominated on the first ballot, and James S. Sherman was renominated for Vice President. The situation in the Democratic party was even more confused. Speaker Champ Clark, of Missouri, Gov. Judson Harmon, of Ohio, Gov. Woodrow Wilson, of New Jersey, and Representative Oscar W. Underwood, of Alabama, among others were the most prominent candidates. The convention met at Baltimore, where a dramatic contest took place between the conservatives, led by A. B. Parker, and the progressives, led by Bryan. The conservatives elected Parker temporary chairman, but the radicals elected the permanent chairman, Ollie James. At first no one had a majority, and a two-thirds majority was required. On the forty-sixth ballot Woodrow Wilson, who after New York began to vote for Clark had the strong personal support of Bryan, was nominated. His immediate nomination was probably caused by the threat of Bryan to force a referendum to the people. Thomas R. Marshall, of Indiana, was named for Vice President. Roosevelt left the Republican party and rapidly organized a new

one, the Progressive, and at Chicago in August received the nomination for the presidency. Hiram W. Johnson, of California, was nominated for Vice President. The Socialist party at Indianapolis named Eugene V. Debs, of Illinois, and Emil Seidel, of Wisconsin; the Socialist Labor, A. E. Reimer, of Massachusetts, and August Gilhaus, of New York; the Prohibitionists, E. W. Chafin, of Illinois, and A. S. Watkins, of Ohio. The platforms did not differ radically as to specific recommendations, and on principles the Republicans and Progressives did not widely differ as to public economics, nor the Democrats and Progressives as to social reform. The campaign abounded in bitter attacks on Roosevelt and emphatic replies from him. The election occurred November 5 and resulted in the choice of Wilson. The popular vote was 6,286,214 for Wilson, 4,126,020 for Roosevelt, 3,483,922 for Taft, 897,011 for Debs, and 208,923 for Chafin. A remarkable development of the voting was the increase of Socialist strength. It more than doubled its 1908 record, rising from 402,460 to 897,011. The electoral vote was 435 for Wilson, 88 for Roosevelt, and 8 for Taft. The Democrats also secured the House by a majority of 120 over all parties and the Senate by 7. See DEMOCRATIC, REPUBLICAN, and PROGRESSIVE parties.

XXXI. Woodrow Wilson's Administration.* (1913-21). Shortly after his induction into office President Wilson called the Congress into extraordinary session to revise the tariff. The event of its meeting was signalized by a return to the custom of Washington and Adams of addressing the Houses in person. The Democrats promptly organized themselves into an efficient machine, headed by Speaker Clark and Leader Underwood in the House and Simmons and Kern in the Senate. The new Tariff Act was drafted by Underwood and Simmons and was passed October 3. The bill was an effort to return to a revenue tariff on the one hand and an effort to prevent business disturbance on the other. On a rough average duties were reduced to a 20 per cent basis, and a provision was made for free sugar within three years. The duty was continued in 1916, the revenue being needed. To take the place of the revenue lost because of the new sugar schedule, an income tax was made a part of the tariff law. The progressive principle was employed in that incomes above \$4000 (\$3000 for unmarried persons) were taxed 1 per cent, \$30,000 to \$50,000 2 per cent, above \$75,000 3 per cent, above \$100,000 4 per cent, and so on until those above \$500,000 were taxed 7 per cent. Despite the purpose mentioned there occurred in 1913-14 a serious business depression, and the protectionists promptly asserted that the measure was a failure. Congress was at the same time considering the problem of currency reform, and the Glass-Owen Bill was framed, which, with an important amendment suggested by Root requiring a gold reserve, effected changes of far-reaching consequence. See RESERVE BANK, FEDERAL.

* CABINET.—*Secretary of State*, William J. Bryan, Nebraska, 1913; *Robert Lansing*, New York, 1915. *Secretary of the Treasury*, W. G. McAdoo, New York, 1913. *Secretary of War*, L. M. Garrison, New Jersey, 1913; *Newton D. Baker*, Ohio, 1916. *Secretary of the Navy*, Josephus Daniels, North Carolina, 1913. *Secretary of the Interior*, Franklin K. Lane, California, 1913. *Postmaster-General*, A. S. Burleson, Texas, 1913. *Attorney-General*, J. C. McReynolds, Tennessee, 1913; *Thos. W. Gregory*, Texas, 1914. *Secretary of Agriculture*, D. F. Houston, Missouri, 1913. *Secretary of Commerce*, W. C. Redfield, New York, 1913. *Secretary of Labor*, W. B. Wilson, Pennsylvania, 1913.

During 1913 foreign relations occupied a large share of the President's attention—as they did throughout the administration—and many problems of delicate nature were confronted. The Mexican problem early became embarrassing. Wilson refused to recognize Huerta as the head of a de facto government, largely on account of the moral principle that the latter was a usurper who had connived at the murder of Madero. Although the embargo on arms was continued, Huerta was unable to secure loans; and the revolution of the Constitutionalists, led by Carranza and Villa, gathered force. (See MEXICO; HUERTA; VILLA.) Relations with Japan were also strained by the passage of laws by the State of California prohibiting the ownership of lands by aliens who could not be naturalized. Japan protested against the discrimination and the violation of treaty rights, and the President sent Secretary of State Bryan to California in an effort to secure a change in the State legislation without success. The countries exchanged notes, and a modus vivendi was finally arranged whereby the United States agreed to test the laws in the courts, and Japan made promises as to future immigration. On May 2 Wilson recognized the Republic of China, having previously advised American bankers not to participate in the international railway loans. In March he announced to Latin American countries which had been suffering from revolutions that the United States would support only "the orderly processes of just government, based upon law, not upon arbitrary or irregular force." Conditions in Nicaragua (q.v.) finally resulted in the conclusion of a treaty which virtually established an American protectorate on the principle of the Platt Amendment. In December, 1913, Wilson delivered a special message on the Mexican situation in which he stated that there could be no peace until Huerta was eliminated. Observing that the revolution was succeeding, he thought that Huerta would soon be crushed and saw no reason why we should be obliged "to alter our policy of watchful waiting." At the same time the Hay Volunteer Bill was enacted providing for an emergency volunteer army of 242,000 men.

Meanwhile Congress was considering the recommendations of the President relative to trust legislation and rural credits. Of five proposed bills two became law, the Interstate Trade Commission Bill, Sept. 8, and the Clayton Anti-Trust Act, Oct. 8, 1914. The first provided for a commission of five members with powers of investigation, supervision, and prevention of unfair competition; the latter embodied the ideas of the Democrats on the trust problem. (See TRUSTS.) It prohibited interlocking directorates and forbade the use of injunctions in labor disputes. Prior to the adoption of these acts the President had secured another victory in the repeal of the Panama Canal Tolls legislation. The issue had arisen because of the protest of Great Britain that the Hay-Pauncefote Treaty had been violated. The President in a special message asked for the repeal on the grounds that the law was a mistaken economic policy, a contravention of treaty obligations, and that the repeal would aid him in the conduct of foreign affairs. With these acts adopted a remarkable legislative record was completed, and Congress adjourned after the longest continuous session within the history of the country.

The situation as to foreign affairs in 1914 had become increasingly acute. On February 3 the

President had lifted the embargo on the shipment of arms into Mexico, and the revolutionists had purchased large amounts of munitions, enabling them to make substantial progress against Huerta. On April 9 occurred the Tampico incident, which involved the arrest by a Huertista officer of some United States marines while on a peaceful errand to buy gasoline and supplies. Rear Admiral Mayo demanded their surrender, an apology, and a salute to the United States flag. Strained negotiations followed in which Huerta refused to comply with the demand for the salute, in which Wilson had supported Mayo. On April 20 the President asked authority from Congress to employ the military and naval forces to exact reparation. It was granted, and in pursuance of it Vera Cruz was occupied after 18 men were killed. Although the cause seemed trivial and the method to involve complications, intervention found ready support, though many urged that it should have been on the grounds of protection to American lives and property. The administration, on the contrary, had warned Americans to leave Mexico, and funds had been appropriated for the purpose of aiding them. While plans were being made for the invasion of Mexico, Wilson accepted the good offices of Argentina, Brazil, and Chile, and agreed to appoint commissioners to meet at Niagara Falls to discuss ways of effecting peace and the settlement of the Mexican problem. While the commissioners were meeting, Huerta, having suffered defeat, resigned and left the government to Carranza, who in turn relinquished it to Carranza. The forces of the United States were withdrawn from Vera Cruz (November, 1914). A treaty was negotiated with Colombia in an attempt to settle her grievances, in which it was stipulated that the United States pay \$25,000,000 and give certain concessions. The Senate postponed consideration of it. During the year 20 peace and arbitration treaties were negotiated, of which 18 were ratified.

The European War, in which the United States promptly declared its neutrality, had immediate important economic and legislative effects in the United States. (See WAR IN EUROPE.) In August a bill was passed admitting foreign-built ships to the American registry with certain restrictions as to coastwise trade. A War Risk Insurance Act was adopted providing for emergency insurance for ships. It was promptly seen that the stopping of a large part of the imports would curtail the revenues and produce a deficit. To prevent this development an emergency revenue bill was passed providing for an increased internal-revenue taxation system.

The election of 1914 had for its issues the new tariff law and the record of the President. The Democrats were successful in retaining their majorities in Congress, but they were reduced in the House, the vote being Democrats 232, Republicans 194, and Progressives 7. In the Senate the Democrats were increased to 53 and the opposition reduced to 43.

The war brought great increase in the export trade, especially in foodstuffs and munitions, most of the former and practically all of the latter going to the Allies, since German shipping had been largely withdrawn from the seas. The great demand caused the available shipping to be overtaxed, and the President introduced in December, 1914, a request for a Ship Purchase Bill. The proposition evoked such opposition that the Republicans, in February, 1915, in a prolonged filibuster aided by seven Democrats,

defeated the measure. In this the President experienced his first serious defeat in Congress.

In the European War there had developed something of a deadlock, and both sides resorted to indirect methods of inflicting injury. The United States was almost in the situation which existed prior to the War of 1812, and intricate complications developed with both Germany and Great Britain. To the one Secretary Bryan sent a note declaring that the United States would hold Germany to a "strict accountability," and to the other a firm protest against the prevention of legitimate American trade by means of illegal blockade and vexatious delays in prize procedures. Deep irritation had been caused by the destruction of the steamer *Gulflight* by a German submarine and by the seizure of the *Wilhelmina* and *Dacia* by Great Britain and France. The United States, however, was horrified when the *Lusitania*, on May 7, without warning was torpedoed by a submarine, when more than 1000 persons, including 114 Americans, lost their lives. On May 13 Wilson sent a strong note to Germany demanding a disavowal of the act, indemnity for the violation of American rights, and stating that the United States stood firmly on the ground that Americans had the right to travel on merchant ships of belligerent nationality. Relations between the two countries reached the breaking point, and many expected and desired war. A large party developed in the country urging military preparation to meet complications which might involve it in war. Attention was directed towards the large number of Americans of German birth and descent who thought that the United States should preserve true neutrality by prohibiting the export of munitions to the Allies exclusively. They emphasized the trade restrictions of Great Britain and alleged that Germany was being deprived of food for its civil population. Notes were interchanged, the tone of the American communications becoming more insistent, until on September 1 Germany declared that liners were not to be sunk without warning. Despite the fact that the cases of the *Nebraskan* and the *Arabic* (disavowed October 5) had arisen and depended on separate negotiations, this announcement was regarded as a Wilson victory. There remained the necessity for Germany to disavow the destruction of the *Lusitania* and indemnify American citizens. Wilson's position in the correspondence with Germany had caused the resignation of Secretary Bryan (June), who thought that his ideas might lead to war and who urged that Americans should be warned to remain off passenger ships of the warring nations. In the meanwhile the indignation among German sympathizers respecting the supply of munitions to the Allies caused many to plan the disturbance of labor by bringing about strikes. Plots were formed, it was alleged, and executed involving the explosion of bombs in factories and the destruction of many munition plants. It was established that the Austrian Ambassador, Dumba, was implicated, and his recall was demanded (September 9). Attaches, Boy-Ed and Von Papen, of the German Embassy, had a similar fate on December 3.

During the short session of Congress an immigration bill was adopted (1915), with a literacy test included, which the President vetoed. In June, 1915, the Supreme Court rendered two important decisions, deciding against the government in the dissolution suit against the Steel Trust and, secondly, that the grandfather clauses

of the Oklahoma and Maryland constitutions were void.

On October 19, President Wilson recognized Carranza as heading the de facto government of Mexico and began to assist him in eliminating Villa.

In December, 1915 the President's message was almost wholly devoted to the championship of military preparedness, although the year before he had opposed those who would turn America into an armed camp, and at the opening of 1916 that appeared as the supreme issue in American politics.

In December, 1915, the sinking of the *Persia* in the Mediterranean Sea again brought the controversy over submarine warfare to the fore. While negotiations were still pending over this incident the channel boat *Sussex* was torpedoed with a loss of over 100 lives. This aroused considerable comment inasmuch as the *Sussex* was strictly a passenger vessel and unarmed. The question of arming merchantmen for defense presented a serious problem. A resolution warning Americans not to sail on armed merchantmen failed to pass both Houses of Congress, indicating that the President was to carry on foreign relations without interference from Congress. On April 14 the United States government demanded that submarine warfare, as it affected neutrals, be abandoned under a penalty of a break in diplomatic relations. See SUPPLEMENT for the German reply.

In February, 1916 Secretary of War Garrison resigned because he could not agree with President Wilson on the question of national defense. Newton D. Baker, of Cleveland, succeeded.

In the early part of 1916 the Mexican situation was considerably altered. In January Villista forces killed several American miners and the United States government demanded that the de facto government punish the guilty parties. On March 9 Villa with about 500 followers invaded the town of Columbus, N. Mex., killed 7 troopers and several civilians, and set fire to many buildings. When he fled he was pursued across the border by United States soldiers. The next day President Wilson ordered a punitive expedition to cross the border, with scrupulous respect for the sovereignty of the Mexican Republic. An agreement was made with General Carranza which permitted him to cross the United States border in pursuit of escaping bandits. A force under General Pershing with the cooperation of Carranza troops pushed Villa into the mountain regions of Chihuahua. Several desultory engagements were fought. At Parral United States soldiers were fired on by natives, and General Carranza demanded the recall of the punitive expedition. This was refused by the United States on the ground that the de facto government was not able to keep the peace along the border. A conference was held between representatives of the two governments to attempt to settle the question of border control, but as no definite agreement could be reached, the expeditionary force remained in Mexico to prevent further violations of the sovereignty of the United States. The State militia was called out to protect the border. In 1916 Charles E. Hughes and Woodrow Wilson were the candidates nominated for the Presidency by the Republican and Democratic Conventions respectively. Charles W. Fairbanks and Thomas R. Marshall were the vice-presidential nominees.

An element of the Progressive Party nominated Theodore Roosevelt for President but he declined the nomination and heartily supported Mr. Hughes during the campaign. Mr. Wilson was re-elected by an extremely small margin, the issue being in doubt for several days. It was decided only by his success in winning the electoral vote in California. The electoral vote stood 277 for Wilson and 254 for Hughes. The President's popular vote showed a gain of two million over that of 1912, in spite of the fact that the Republicans gained in the House of Representatives and elected many of their State candidates.

Throughout 1916 the United States was brought nearer to war with Germany. The German war submarine *U-53* entered Newport harbor on October 7, 1917, and after delivering mail for the German Embassy, departed. Within the next two days it had sunk, in swift succession, one Dutch, one Norwegian and three British ships within sight of the American coast. The submarine escaped unharmed.

The President made efforts during December, 1916 and January, 1917 to bring about a condition among the combatant nations which would lead to peace, endeavoring among other things to secure a statement of terms from both sides upon which the war could be honorably concluded. These attempts are described in the article SUPPLEMENT.

Following closely on these efforts, Germany embarked on a ruthless submarine warfare, declaring that all merchant ships found in a prohibited zone would be sunk after February 1, 1917, without warning. President Wilson, on February 3, addressed both Houses of Congress and declared that he had directed the Secretary of State to announce to the German Ambassador that all diplomatic relations between the two governments were severed, and that the American Ambassador had been recalled from Berlin. The President declared further that he hoped that Germany would not actually embark upon the ruthless submarine warfare and that only overt acts on her part would convince him that she would do so. There followed a period during which the President waited for such overt acts. In the meantime the government undertook whatever measures were possible looking toward war. Congress, on February 26, gave President Wilson authority to supply guns and ammunition to American merchant ships. German submarine warfare was carried on with great ferocity and Allied and American vessels were sunk. Congress was called in special session on April 2 and the President made an address in which he summarized the offenses of Germany against the United States government and recommended that Congress declare that the course of the German government was nothing less than war against the government and people of the United States. A resolution declaring war was passed by both Houses and was signed by the President on April 6.

The details of preparation for and the carrying on of war upon which the United States now embarked are told in the account of the war in SUPPLEMENT. See also section on *Army* above. The successful outcome of the struggle was made possible by the unwavering loyalty and devotion of the American people in military and civil capacities to the one object of bringing about a victorious issue. The polit-

ical happenings of 1917-18 had to do almost entirely with the war, which obscured all other issues and united all political parties to a common end.

When the war was concluded the nation quickly returned to a peace basis and preparations were at once begun for the return of American soldiers from Europe. The first of these arrived on December 2, 1918 and they were followed by thousands of others in quick succession until all had been returned except the forces left in Germany to represent the United States. The President, on November 18, 1918, announced that he would attend the Peace Conference in Paris in person. He named as peace delegates, Robert Lansing, Secretary of State; Henry White, formerly Ambassador to France; Edward M. House, and General Tasker H. Bliss. Mr. White was the Republican representative. The President was received in Paris with great enthusiasm and, prior to the meeting of the peace conference, he made visits to Great Britain and Italy, where he was hailed as the savior of the world.

The President's chief concern at the peace conference was the preparation of the covenant of the League of Nations and he gave his utmost efforts to this object. After the first draft of the covenant had been prepared, he returned to the United States for a brief visit, on February 24, 1919. There had already developed in Congress, especially in the Senate, a pronounced opposition to the terms of the covenant. This opposition was centered chiefly upon Article 10, which pledged the United States "to preserve as against external aggression, the territory of all the states in the League." President Wilson, during his stay in the United States, made several addresses in which he defended the covenant. He then returned to Paris. When the Treaty of Versailles was signed, on June 28, 1919, the President at once returned to the United States, arriving on July 9.

The Eighteenth Amendment prohibiting the sale or manufacture of intoxicating liquors became effective on July 1, 1919, three-fourths of the States having ratified the amendment. The amendment, however, was not put into operation until January, 1920.

Political interest now centered in the deliberations on the peace treaty in the Senate. The Committee on Foreign Relations having considered the treaty, it was introduced in the Senate on September 28. There had been added 38 amendments and four reservations. The amendments were rejected and the interest was centered upon the reservations. The first of these gave to the United States the right to withdraw from the League of Nations after due notice had been given. The second freed the United States from any obligation toward carrying out Article 10, noted above. The third reservation provided that the United States should have the power to decide what questions came within domestic jurisdiction. In the fourth reservation the United States declined to submit for arbitration and inquiry any questions dependent on or relating to the Monroe Doctrine. The President had previously, on the advice of President Taft and others, inserted in the treaty a declaration that the Monroe Doctrine continued to be in force. After a long debate in the Senate in which much bitterness developed, the treaty was defeated, with the reservations by a vote of 55 to 39; and without the reservations,

by a vote of 55 to 38. On April 30, 1920, Senator Knox introduced a resolution in the Senate providing for a declaration of peace with Germany. This resolution was adopted by both Houses but was vetoed by the President. A bill for the conduct and regulation of railways was passed by Congress during this session.

Robert Lansing, Secretary of State, resigned on February 13 as a result of severe criticism of his action in summoning the Cabinet in session during the illness of the President. He was succeeded by Bainbridge Colby of New Jersey.

The chief issue of the presidential campaign of 1920 was the League of Nations. While the treaty was being considered in the Senate, President Wilson made an extended tour of the country, making addresses on its behalf. This was brought to an end by a physical breakdown in the nature of a shock, which prevented his active participation in the affairs of the government practically until the end of his term.

The Republican candidates for the nomination prior to the convention were General Leonard Wood, Governor Lowden of Illinois, Senator Hiram Johnson of California, and Herbert Hoover. The leading Democratic candidates were William G. McAdoo and Governor James M. Cox of Ohio. The Republican National Convention met in Chicago on June 8. The forces of General Wood and Governor Lowden were so evenly matched that the contest ended on June 12 by the nomination of Senator Warren G. Harding for President and Governor Calvin Coolidge of Massachusetts for Vice-President. At the Democratic convention, which met at San Francisco on June 28, Governor Cox was nominated for President and Franklin D. Roosevelt of New York, Assistant Secretary of the Treasury, for Vice-President. The campaign which followed was an exceedingly aggressive one, especially on the part of Mr. Cox, who toured the country making speeches in defense of the League of Nations in practically every State. Senator Harding remained at home, where from day to day he addressed delegations. The Republicans, for the most part, ignored the League of Nations but directed their attacks to the administration of the President. In the election in November, Harding received 16,091,804 popular votes and Cox, 9,014,667. Harding and Coolidge received 404 electoral votes and Cox and Roosevelt, 127. These were the largest popular and electoral majorities ever cast.

The Congressional elections gave the Republicans 307 members in the House and the Democrats 127. The Republicans gained a majority of 22 in the Senate.

The Nineteenth Amendment providing for women suffrage had been adopted prior to the election, and the women, for the first time, participated in the election of a president.

Warren G. Harding's Administration (1921-). President Harding was inaugurated on March 4, 1921. He at once announced the members of his Cabinet, as follows: Secretary of State, Charles E. Hughes of New York; Secretary of the Treasury, Andrew W. Mellon of Pennsylvania; Secretary of War, John W. Weeks of Massachusetts; Secretary of the Navy, Edwin C. Denby of Michigan; Secretary of the Interior, Albert B. Fall of New Mexico; Postmaster-General, Will H. Hays of Ohio; Attorney-General, Harry M. Daugherty of Ohio; Secretary of Agriculture, Henry C. Wallace of

Iowa; Secretary of Commerce, Herbert Hoover of California; and Secretary of Labor, James J. Davis of Pennsylvania. On March 23 the President issued a call for a special session of Congress to be held on April 11, 1921. Congress at once took up the consideration of measures looking toward economic and financial reconstruction. An Immigration Bill, which limited the immigrants of any nationality, during the fiscal year, to three per cent of the number of that nationality in the United States at the census of 1910, was passed. This measure had previously been vetoed by President Wilson. An Emergency Tariff Bill was passed and was approved by the President on May 27. A budget law was enacted and was signed by the President. This also had been previously vetoed by President Wilson. The appropriations for the army and navy were radically cut down and by the terms of the Army Bill, the army was limited to 150,000 men. The Senate passed, on April 30, a resolution previously offered by Senator Knox, declaring the war between the United States and the Central Powers at an end and repealing the declaration of war. This was followed by the preparation and ratification of a treaty with Germany. By the terms of this treaty the United States is not bound by any of the provisions of the Versailles Treaty which relate to the League of Nations. It reserves to the United States, however, whatever favorable concessions are made by Germany to the Allied powers. The treaty was signed by the President on September 1, 1921.

A measure was passed by Congress giving American coastwise shipping the right of free passage through the Panama Canal. This repealed the former measure by which tolls were charged for American as well as other vessels. The laws relating to taxation were amended by Congress and the income tax was reduced in some particulars. The elections held in November indicated support of the actions of the government. Negotiations were carried on during the year with Mexico with the object of bringing about a better understanding with that country and the recognition by the American government.

The overwhelming sentiment against war and for the decrease of expenditures for armaments on the part of the American people were shared by both the President and Congress. President Harding, in November, 1921, issued invitations for a Conference on the Limitation of Armaments to include representatives of Great Britain, France, Japan, Italy and Belgium. China was also represented, as the conference was widened to include questions relating to the Far East. The conference was in session until February, 1922, and as a result of its deliberations, nine treaties or other agreements were formulated. The most important of these was the agreement of the great powers to limit naval armaments to a specialized number of tons and to maintain the navies of Great Britain, the United States and Japan on a ratio of 5-5-3. See above section *Navy*. In another agreement the great powers agreed to respect the rights of one another in the Far East and to confer if trouble arose. Still another declared the intention of the great powers to respect the rights of China. Japan engaged to return the province of Shantung. The other treaties and agreements related to various phases of naval warfare, including the use of gas, limitation of the number

of submarines and their use in warfare, and similar subjects. The United States and Japan also agreed as to their mutual rights in the island of Yap.

The United States declined to be represented at the conference at Geneva on the ground that it was a political as well as an economic conference. It also declined to participate in the conference at The Hague which had to do with the political and economic conditions of Russia.

Congress ratified all the treaties passed by the Washington Conference, and a great part of the deliberations during the summer of 1922 related to a new tariff measure. The latter half of 1922 was a period of industrial turmoil and dissatisfaction. A general strike of the coal miners in both the anthracite and bituminous fields, which for months had threatened to occur, was declared in bituminous fields on April 1, at the expiration of the two year contracts between the operators and the employees. In all the fields where union labor was employed, operations in the mines ceased. Efforts were at once undertaken by the President and other government agencies to reconcile the differences between the miners and their employers. Public opinion was greatly stirred in May by an assault upon non-union miners in Herrin, Ill., in which nineteen non-union miners, after having been taken prisoner by the members of the striking organizations, were shot down in cold blood. It was charged that the local and State authorities had been dilatory in protecting the non-union miners and for several months little action was taken. In September, however, over 50 indictments had been found against union miners accused of participating in this affair and there were indications that justice would be rendered.

Work in the anthracite mines continued for several months after the strike had begun in the bituminous mines, and negotiations were carried on between the employers and employees which it was hoped would prevent a strike. These negotiations, however, failed and the anthracite miners, who were almost entirely unionized, abandoned their work. This resulted in a non-production of coal in any except a few fields, especially in West Virginia, which were operated by non-union labor. Every resort in the hands of the President and of the members of his Cabinet was exercised to settle the differences, so that coal could be produced in time for use before the cold weather approached, as the reserves of coal were speedily used up. These efforts were not successful until about the middle of September, when a compromise was finally arrived at between the anthracite and bituminous miners and their employers by which they were to return to work and their difficulties would be examined by a commission appointed by the President.

Congress passed several measures aimed at a permanent settlement of the difficulties in the coal mining fields. The most important of these provided for a Fact Finding Commission, which should examine the coal question in all its aspects and report on possible remedies for the recurring disputes between employers and employed. Another bill prohibiting profiteering in the sale of coal used in interstate commerce was passed.

No less serious than the coal strike was a general strike of the shopmen on all the rail-

roads of the country, which was declared on July 1, 1922. The Railroad Act of 1920 had created a Railroad Labor Board which had authority to arbitrate the question of wages and other questions arising between the owners and employees of the railroads and also the authority to increase or decrease the wages of employees. This board decreased the wages of those employed in the repair shops and the railroads, and officers of the organizations at once prepared for a general strike. The men voted by a large majority for such a strike and the men on all the roads in the country left their work on July 1. Railway officials at once began to recruit men to take the place of those who had left. The President, as in the case of the coal strike, held many conferences with the opposing elements in the effort to establish an agreement by which the men could return to their work. These failed, chiefly on the question of seniority. All railroad employees have certain rights which come from their length of service, and the striking employees insisted that these rights should remain with them if they should return to work. The employers refused to grant this, declaring that those who had left had forfeited these rights and that it would be unfair to the men who had taken their places if they should be deprived of them and the striking employees restored.

This condition continued throughout the summer of 1922.

All attempts to arrive at a settlement having failed, the Attorney General, in September, secured an injunction against the officers of the striking organizations preventing them from continuing to obstruct interstate commerce. This injunction declared that a conspiracy existed among these organizations to so obstruct commerce and that the obligation to abide by the decisions of the Railroad Labor Board had not been carried out.

This injunction was bitterly fought by the officials of the striking organizations, who declared that the Attorney General had greatly exceeded his authority in obtaining such an injunction, and threatened his impeachment. In spite of this, the injunction continued in effect and writs were served upon the officers of the striking organizations.

UNITED STATES, EXTENSION OF THE TERRITORY OF THE. Prior to 1781 only six of the 13 original States, viz., New Hampshire, Rhode Island, New Jersey, Pennsylvania, Maryland, and Delaware, had exactly defined boundaries. Of the remaining seven States, some claimed to extend to the Pacific Ocean, others to the Mississippi River. The States with inexact boundaries ceded to the general government their claims to lands west of their present limits in succession, as follows: March 1, 1781, New York; March 1, 1784, Virginia, the cession including the territory which now forms the State of Kentucky and the parts of the States of Ohio, Indiana, and Illinois which lie south of the forty-first parallel, Virginia, however, reserving from this cession for military-bounty lands the entire territory, 6570 square miles, between the Scioto and Little Miami rivers, from their sources to the Ohio River; April 10, 1785, Massachusetts, including her claims to territory west of the present boundary of New York; May 28, 1786, Connecticut, the cession being the territory west of the Alleghanies between the parallels of 41° and 42°, except a strip 120 miles in length lying directly west of Pennsylvania, retained for the benefit of her public schools, and later known as the Western Reserve (q.v.), which she ceded to the United States in 1800; Aug. 9, 1787, South Carolina, the territory ceded being a strip of land about 12 miles wide, south of the thirty-fifth parallel and extending along the southern boundaries of North Carolina and Tennessee to the Mississippi; Feb. 25, 1790, North Carolina, the territory ceded constituting what is now

Tennessee; June 16, 1802, Georgia, after receiving that part of the cession of South Carolina lying within her present limits, ceding all between her present western boundary and the Mississippi, and between the South Carolina cession and the thirty-first parallel, embracing a large part of what is now Mississippi and Alabama. The foregoing cessions secured to the general government nearly all territory ceded by Great Britain, not included in the original 13 States, as in the main now bounded. On Nov. 25, 1850, the State of Texas ceded all her claims to lands west of the twenty-sixth meridian west of Washington (103d Greenwich) and between lat. 32° and 36° 30'.

Cessions by Foreign Powers. In the treaty of Sept. 3, 1783, with Great Britain the western limits of the United States were declared to be the Mississippi River to the thirty-first parallel. On April 30, 1803, by treaty with France, the Province of Louisiana was acquired. (See LOUISIANA PURCHASE.) Its western boundary as finally adjusted, Feb. 22, 1819, by treaty with Spain, ran up the Sabine River, to and along the seventeenth meridian (94th Greenwich), to and along the Red River, to and along the twenty-third meridian (100th Greenwich), to and along the Arkansas River, to and along the Rocky Mountains, to and along the twenty-ninth meridian (106th Greenwich), to and along the forty-second parallel, to the Pacific Ocean. Its northern boundary conformed to the boundary established between the British possessions and the United States. On the east it was bounded by the Mississippi as far south as the thirty-first parallel, where different boundaries were claimed. The United States construed the cession of France to include all the territory between the thirty-first parallel and the Gulf of Mexico, and between the Mississippi and Perdido, the latter of which is now the western boundary of Florida. Under this construction of the cession, the "Province of Louisiana" is now covered by those portions of the States of Alabama and Mississippi which lie south of the thirty-first parallel; by Louisiana, Arkansas, Missouri, Iowa, Minnesota west of the Mississippi, Kansas, Nebraska, North and South Dakota, Montana, Idaho, Oregon, Washington, and Oklahoma; and by the portion of Colorado lying east of the Rocky Mountains and north of the Arkansas River, and that portion of Wyoming lying east of the Rockies and south of the forty-second parallel. Spain, from which power France had acquired Louisiana by treaty in 1800 (see SAN ILDEFONSO, TREATY OF), claimed that she had ceded to France no territory east of the Mississippi except the "Island of New Orleans," and also contended that her Province of West Florida included all of the territory south of the thirty-first parallel and between the Perdido and Mississippi, except the "Island of New Orleans." Under this construction, the "Province of Louisiana" included on the east of the Mississippi only the territory bounded on the north and east by the "rivers Iberville and Amite and by the lakes Maurepas and Pontchartrain." By the treaty of 1803 the national territory was increased by 1,171,931 square miles. The extreme northwestern portion of this territory was claimed by Great Britain, with which power the United States concluded the Northwest Boundary Treaty in 1846. By the treaty of Feb. 22, 1819, Spain formally ceded the territory now covered by Florida, by those portions of Alabama and Mississippi which lie south of the thirty-first parallel, and by that portion

of Louisiana which lies east of the Mississippi and is not included in the "Island of New Orleans." This territory was styled by Spain the "provinces of East and West Florida." Previous to this cession, by the authority of the joint resolution of Jan. 15, 1811, and the Acts of Jan. 15, 1811, and March 3, 1811, passed in secret session and first published in 1818, the United States had taken possession of the East and West Floridas. In fact, as early as 1810 the Americans controlled all of West Florida except Mobile, which was annexed in 1813, while in 1814 Jackson temporarily seized Pensacola, and again in 1818 occupied both Pensacola and St. Marks. The United States, however, did not take formal possession until 1821. After prolonged negotiations and a vigorous political contest Texas, formerly a portion of Mexico, and later an independent republic, was admitted to the Union by a joint resolution of Congress, approved by President Tyler on March 1, 1845. As a result of the Mexican War (q.v.), by the Treaty of Guadalupe Hidalgo (q.v.), on Feb. 2, 1848, Mexico ceded the territory now covered by California and Nevada, also her claims to the territory covered by the present Texas, by Utah, by the bulk of Arizona and of New Mexico, and by portions of Wyoming and Colorado. That part of Arizona and that part of New Mexico lying south of the Gila and known as the Gadsden Purchase were ceded by Mexico on Dec. 30, 1853. By treaty of March 30, 1867, Russia ceded Alaska. At the close of the Revolutionary War the territory really occupied by the old 13 States covered scarcely a quarter of a million square miles, and after the treaty of 1783 the nation occupied only 825,000 square miles, but in 1867 the territory belonging to the United States had an area in round numbers of 3,561,000 square miles. A further accession was effected in 1898, when, on July 6, Congress passed a joint resolution annexing Hawaii (q.v.) to the United States. In the following year negotiations were concluded by which the island of Tutuila, Samoa, on which is located the excellent harbor of Pago Pago, was ceded absolutely to the United States. An important accession of territory was that incident to the Spanish-American War (q.v.), and formally effected in the treaty of Dec. 10, 1898, in accordance with which Spain ceded Porto Rico (q.v.) and the Philippine Islands (q.v.), together with the island of Guam (q.v.), to the United States.

Bibliography. The most important volume in this connection, with all the texts, is the *Treaties and Conventions Concluded by the United States and other Powers since July 4, 1776*, published by the Government (Washington, 1880 et seq.). Some useful maps illustrating these treaties are to be found in Edward Channing, *The United States of America, 1765-1865* (New York, 1896); id., *History of the United States*, vols. i, ii (ib., 1905-08). Consult also Theodore Roosevelt, *Winning of the West*, vol. iv (New York, 1904); C. K. Adams, *History of the United States* (rev. ed., Chicago, 1909). Of special works, Donaldson, *Public Domain* (Washington, 1884); H. B. Adams, *Maryland's Influence on the Land Cessions* (Baltimore, 1885); O. P. Austin, *Steps in the Expansion of our Territory* (New York, 1903); Henry Gannett, *Boundaries of the United States* (3d ed., Washington, 1904); Justin Winsor, *Narrative and Critical History of America*, vol. vii, Appendix (Boston, 1886-89).

UNITED STATES, LITERATURE OF THE. See AMERICAN LITERATURE.

UNITED STATES CHRISTIAN COMMISSION. An organization kindred to the United States Sanitary Commission (see SANITARY COMMISSION, UNITED STATES), formed during the Civil War in the United States to promote the spiritual and physical welfare of Federal soldiers and sailors. A convention of Young Men's Christian Association delegates met in New York City in November, 1861, and formally organized the United States Christian Commission of 12 members with George H. Stuart, a Philadelphia philanthropist, as president, and B. F. Manierre, of New York, as secretary. Contributions of money, literature, and supplies were asked for and a generous response was made. The central office of the commission was in Philadelphia, but it had branches in all of the large towns and cities, and its agents followed the armies. Temporary libraries were established; chapels for religious worship were erected at permanent camps; Christian burial was accorded to the dead; graves were suitably marked. The American Bible and Tract societies gave enormous quantities of their publications for distribution; the government furnished free transportation to the commission's agents and for its supplies, while the telegraph and transportation companies furthered its efforts in various ways. Consult Moss, *Annals of the United States Christian Commission* (Philadelphia, 1868).

UNITED STATES COPYRIGHT ACT. By the Act of March 4, 1909, the law with reference to copyright was redrafted and rearranged. The second or renewed period of copyright was extended to 28 years, thus increasing the life of the copyright by an additional 14 years. The duties which had been assigned to the librarian of Congress were delegated to a newly created officer called the register of copyrights.

In pursuance of authority contained in the statute itself the United States Supreme Court formulated a set of rules which simplified the procedure and practice with reference to copyright actions and proceedings. The prohibition against the importation of works which are copyrighted in the United States was modified by the Act so as to permit the importation of works in raised characters for the use of the blind, and authorized editions in the original foreign language of works whose translations only have been protected by United States copyright. Exception was also made of libraries or collections purchased abroad *en bloc* for societies, institutions, or libraries of learning and fine arts. The provisions dealing with infringements were considerably amplified and set forth at some length in the statute.

Later amendments to the Act include motion-picture photo plays and motion pictures other than photo plays as works on which copyright may be claimed. Provision was also made for phonograph records and royalties to owners or manufacturers of this class of articles.

The additions to the United States Copyright Act with reference to photo plays and phonograph records were incorporated into the British Act by the Act of 1911, which amended and consolidated the English copyright law along lines similar to the American.

UNITED STATES DAUGHTERS OF 1812. A patriotic society founded in Cleveland, Ohio, in 1892, and incorporated as a national organiza-

tion Feb. 25, 1901. It has for its object the perpetuation of the memory of the founders of America, with their records of service in the French War, the Revolution, and the War of 1812. It admits to membership women who are lineal descendants from an ancestor who assisted in the War of 1812, either as a military or naval officer, a soldier, or a sailor, or in any way gave aid to the cause. The membership is about 1000.

UNITED STATES FLAG. See **FLAG**.

UNITED STATES MILITARY ACADEMY. See **MILITARY ACADEMY, UNITED STATES**.

UNITED STATES NATIONAL MUSEUM. Established as a branch of the Smithsonian Institution, by the congressional Act of Aug. 10, 1846, founding the latter. It is the designated depository for all collections in zoology, botany, geology, ethnology, archæology, and the arts belonging to the government. Its collections are superior in all that relates to the natural history and aborigines of North America. Its collections have been derived largely from naval expeditions, government surveys, Bureau of Fisheries, Department of Agriculture, Bureau of American Ethnology, private donations, and exchanges. The Museum also gathered interesting collections in American history. The fundamental act contemplated the formation of a National Gallery of the Fine Arts under the Smithsonian Institution. The first decisive movement towards the realization of this project took place in 1906, through the gift by Charles L. Freer of paintings by Whistler, Tryon, Thayer, and Dewey, and of Oriental art, and the bequest of the Harriet Lane Johnston collection. In March, 1907, 50 paintings by American artists were added by William T. Evans. A supplemental transfer of 110 articles increased the Freer collection to 4811 items of American and Oriental art in 1915. From time to time other accessions have been made through purchase or gift. The collections occupy the greater part of the Smithsonian building, an adjacent building, covering $2\frac{1}{4}$ acres, completed in 1881, and a new building completed in 1910 at a cost of \$3,500,000. In 1914-15 nearly 6000 specimens of American industrial arts were added. The Secretary of the Smithsonian Institution is ex officio the keeper of the Museum, which is under the charge of an assistant secretary, and has a staff of curators and assistants, numbering about 75. The publications comprise an annual report, a series of *Bulletins* begun in 1875, a series of *Proceedings* dating from 1878, and the *Contributions* from the National Herbarium. The library contained (1915) 45,818 volumes and 76,295 pamphlets.

UNITED STATES NAVAL ACADEMY. See **NAVAL ACADEMY, UNITED STATES**.

UNITED STATES VETERAN NAVY. A patriotic society organized Sept. 21, 1899. Eligible for membership are all persons who as commissioned officers or enlisted men were connected with any branch of the naval service of the United States during the Civil War or the Spanish-American War, or who in the future shall be engaged, as members of the navy, in war against an enemy of the United States. The society has a total membership of about 3500.

UNITED ZION'S CHILDREN. See **RIVER BRETHREN**.

UNITIES, DRAMATIC. Three classical qualities of a drama, the unities of time, place, and action. See **DRAMA**.

UNIT ORCHESTRA. See **UNIT ORGAN**.

UNIT ORGAN. A wind instrument, the most recent development of the regular church organ (q.v.). In 1853 William Hill and Sons introduced a new stop, the *voix céleste*, the pipes of which were tuned slightly flat so as to produce, in combination with other stops, an undulating tone resembling that of the strings of an orchestra. By experiment it was found that by tuning the pipes a trifle sharp a warmer tone was produced. By the end of the century the *céleste* was built with three ranks of pipes, one in correct pitch, the other two slightly sharp and flat, respectively. Thus a tone was produced that very nearly approached the strings. The next step was the addition of the new percussion stops, which operate real chimes, cymbals, and all kinds of drums. Organs thus equipped became known as unit organs, and about 1908 began to be installed in some theatres, replacing the orchestra. Two or three years later appeared the unit orchestra. Several builders, almost simultaneously, conceived the idea of replacing in these instruments the diapason (see **ORGAN**), which always has been, and still is, the foundation of the real organ tone by the *céleste* or string tone. Thus it can readily be seen that a unit organ is essentially an organ with a moderate admixture of *céleste* and percussion stops, whereas the unit orchestra has a full complement of *célestes* and percussion stops, to which the diapason is very much subordinated.

UNIT SYSTEM. The unit system of organization, sometimes called the Hine system from its originator, Maj. Charles DeLano Hine, is based upon the concept that organization is a branch of sociological science. The system seeks, primarily by scientific organization and secondarily by simple, direct methods, to solve the administrative problems imposed by complex modern conditions in the conduct of government, of education, of industry, of transportation, and of commerce. As yet its application has been confined to a few railways. The system insists that organization is a series of units, beginning with the individual as the indivisible unit of society. A group of individuals forms a unit of organization. A group of such units constitutes a higher unit, which in turn may become a component of a still higher unit, and so on to whatever extent may be found desirable and practicable in the particular activity. The crux of a given problem of organization is then to determine what grouping produces the most logical and efficient units. The system demands unvarying recognition of the axiom that the whole is greater than any of its parts, that the entire undertaking is greater than any of its constituent administrative departments. The avowed effort in practical application is to emphasize and encourage such an old fashioned sense of individual and personal responsibility as will produce maximum composite efficiency through balanced team work of the component units. A general notion of the system is best conveyed by an outline of the official instructions through which it is inaugurated.

In the general operating organization of a railway, the commonly used titles general superintendent, superintendent of motive power, chief engineer, superintendent of transportation, general storekeeper, superintendent of telegraph, and perhaps superintendent of dining cars, are abolished. The officials previously thus designated, while they continue charged with the re-

sponsibilities formerly devolving upon them, are reappointed assistant general managers of the road. Similarly the divisional officers, known under the older systems as master mechanic, division engineer, train master, traveling engineer, and chief dispatcher, and possibly division storekeeper, and station inspector, exchange these titles for the general title of assistant superintendent. The number of assistant general managers may vary with the size of jurisdiction, but is normally eight, including the man previously the assistant general manager, who, to avoid misunderstanding, is reappointed as senior or number one, on the new official list. The number of assistant superintendents on an operating division naturally varies with its size, but is normally six (perhaps eight, if storekeeper and station inspector be included), the man previously known as the assistant superintendent standing number one on the new list. In either general or divisional offices this senior assistant is normally at headquarters, and is in effect, though not in name, the chief of staff, though no distinct grade of senior or chief assistant is actually created. In case of the prolonged absence of this number one (or actual, although not nominal, senior) the head of the unit (general manager or superintendent, as the case may be) designates the most available of the other assistants to remain at headquarters. An unwritten law operates to make such designated assistant the chief, or senior, of all others for the time being. Advantage is sometimes taken of this elastic feature of assignment to rotate various assistants through the senior chair in order to gain comprehensive training for higher positions.

While each man remains specially charged with his former duties, he gains through his broader title a new vision of responsibility for efficiency of the road as a whole. The hurdles of departmental prejudice are removed, the limitations of descriptive title are abolished, and broader lines of activity and of interest in the conduct of the property as a whole are developed. It is to be noted further, that the unit system of organization eliminates government by chief clerks. If the manager or superintendent is absent from headquarters there is always an assistant manager or an assistant superintendent in charge. The system insists further that no person shall sign the name or initials of another. All officers, agents, and employees are instructed to transact business within their respective spheres of responsibility or authority, over their own initials. Operators, stenographers, clerks, and others are instructed to avoid autographic imitation, a man's name being considered his birthright. When an individual's own title is normally insufficient for the necessary signature, or when the prefix acting or assistant is inappropriate, he must sign for himself, adding such explanatory phrase as for the agent, etc. The unit system thus aims, while retaining each official for the work for which he is specially qualified, to make every one available for prompt, comprehensive action when occasion requires, and to minimize the undesirable features of necessarily distant control by insisting that such inside direction shall be exercised only by officials duly qualified by outside experience.

UNITY OF CONSCIOUSNESS. In epistemology, the formal a priori of all cognition; the subjective source of categories, forms of in-

tuition, and the assumption (*Setzung*) of objects. It is, therefore, practically the equivalent of Kant's transcendental apperception. The unity of consciousness derives from the broader unity of the self, i.e., the identity, permanency, and unity of a conscious living being. We may, then, think of the unity of consciousness as the equivalent of the self as conscious; and in various epistemological systems the terms self, unity, and unity of consciousness are employed interchangeably. The phrase is also used in functional psychology to denote the coherence of mind; the functions of thinking, feeling, willing, are conceived as part-functions belonging to an underlying unity, which is again frequently identified with the self (q.v.). Consult: J. M. Baldwin, *Senses and Intellect* (New York, 1890); Harald Höffding, *Outlines of Psychology* (ib., 1891); M. Eisler, *Wörterbuch der philosophischen Begriffe* (Berlin, 1910).

UNIVERSALISM (from *universal*, from Lat. *universalis*, relating to all or the whole, from *universus*, all, whole, entire, turned into one, from *unus*, one + *vertere*, to turn). The name given to the religious faith of those who believe in universal salvation, or as it is now generally stated, in the eternal progress of all souls. Modern Universalists claim that this doctrine is contained in the New Testament, in the teachings of Jesus, and is in harmony with the laws of nature as taught by science and sanctioned by reason and philosophy. Universalists claim this interpretation of the Bible dates from the early centuries of Christianity, citing in proof thereof the Sibylline Oracles (c.150), and the teaching of Clement of Alexandria (c.195), that man was created to be educated and not for a limited trial, that his opportunity for education is as lasting as his being, and that punishment is remedial. They find it in the teachings of Origen (c.185-c.254), and in the common belief among Christians of all sects in the second and third centuries that between the death and the resurrection of Jesus he went to the underworld and there taught the souls that had sinned in the days of Noah; these, argued Clement, included all who there or elsewhere need salvation. Universalists also believe that their faith was extensively held in the fourth century and that of the six theological schools then established in the Christian world, four (the schools of Alexandria, Cæsarea, Antioch, and eastern Syria) taught it; that it was also fundamental in the fifth century in the teachings of Theodore of Mopsuestia, the founder of the Nestorian Church, in whose *Confession of Faith and Sacramental Liturgy* it is plainly declared; that Maximus the Confessor (580-663) also taught and defended it in the sixth and seventh centuries; that Pope Gregory's instructions to his missionaries show its existence in the eighth century, and that in the ninth it was ably advocated by John Scotus Erigena. The subsequent period until the Lutheran Reformation was not favorable to any expression of thought that antagonized the Latin theology. The Church silenced by force all voices that repudiated its teachings and burned all books contaminated by so-called heresies. But, in spite of all this, Universalism was manifest in the teachings of such thinkers as Raynold, Almaric, Albertus Magnus, Solomon, Bishop of Bosra, Ruysbroek, Tauler, and John of Goch, and in the societies of the Lollards, Brethren of the Common Life, Brethren and Sisters of the

Free Spirit, and the Men of Understanding. With the Reformation Universalism revived. The original 42 articles of religion, drawn up by the Reformers in England in 1552, declare: "They also deserve to be condemned who endeavor to restore that pernicious opinion that all men (though never so ungodly) shall at last be saved; when for a certain time, appointed by the Divine Justice, they have endured punishment for their sins committed." When the articles were reduced to 39 in 1571 this condemnatory article was omitted. Many of the Mystics, the German Baptists, the Mennonites in Holland, the French Protestants, the Moravians, and various smaller sects in the Old World, advocated Universalism.

It was not, however, until about 1750 that an organization called Universalist was created. Before that time the believers in universal salvation were affiliated with sects bearing various names and were spoken of as Origenists, Merciful Doctors, and by other names indicating their dissent from the dogma of the never-ending misery of the wicked; but at the date first given Rev. James Rely became a Universalist and organized a Universalist church in London, to which he ministered until his death, about 30 years later. At the present time very few churches in Europe bear the Universalist name, but the doctrine of Universalism finds favor, and in some instances open advocacy, in churches of various names. Many Unitarians in Europe are avowed Universalists, just as the Universalists of America are generally Unitarians.

The doctrine of Universalism was preached in America as early as 1636 by Samuel Gorton, the New England mystic, and put forth in the speeches and writings of Sir Henry Vane, the younger, Governor of Massachusetts; by Dr. George de Benneville about a century later; by eminent Episcopalians; by prominent Congregationalists, such as Chauncey and Mayhew of Boston, and Huntington of Connecticut; and by many German Baptists. John Murray (q.v.), the father of Universalism in America, came to New Jersey in September, 1770. On Jan. 1, 1779, 15 persons who had been suspended from the First Parish Church in Gloucester, Mass., for becoming regular attendants on the preaching of Murray, united under "Articles of Association as the Independent Christian Church in Gloucester" for the defense and promulgation of their Universalist faith. Murray was not long without ministerial helpers. Elhanan Winchester, who had been an eminent Baptist preacher in Philadelphia, with more than 100 of his church in that city, was excommunicated for having become believers in Universalism; Adams Streeter and Caleb Rich, in New England, became preachers of the common salvation before they saw or knew Murray. Later, Hosca Ballou, repudiating all the old notions connected with trinitarian dogmas, became the first openly avowed American advocate of Unitarian views of Christ; put the emphasis of Christian theology on God's Fatherhood of the human race; and interpreted the teachings, sufferings, death, and resurrection of Jesus as designed, not to effect any change whatever in God, but to change man and bring him into harmony with his Heavenly Father. The modern church has a free platform and a broadly educated ministry. It recognizes a harmony and not a conflict between religion and science; advocates the principles of evolution; interprets the Bible rationally and spiritually

and not literally; teaches that all men are divine by nature, are capable of development after the Christ type, and man's destiny is the full development of his soul and a harmonious co-operation with God's laws.

In 1803, at the annual session of the New England Convention, in view of diversity of opinion as to how universal salvation was to be the result of God's government, three Articles of Belief were agreed upon as stating the general belief of those present and serving as a working basis of fellowship. The articles of fellowship, known as the Winchester (N. H.) Profession of Faith, are as follows:

Article 1. We believe that the Holy Scriptures of the Old and New Testaments contain a revelation of the character of God and of the duty, interest, and final destination of mankind. Article 2. We believe that there is one God, whose nature is Love, revealed in one Lord Jesus Christ, by one Holy Spirit of Grace, who will finally restore the whole family of mankind to holiness and happiness. Article 3. We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practice good works; for these things are good and profitable unto men.

In 1870, when the Universalists of the United States formed their General Convention, the above three articles were made a basis of their clerical fellowship, but as there soon arose different opinions as to the exact meaning of particular phrases in the three articles, several changes were advocated from year to year, until 1898, when, at a convention in Chicago, it was voted to allow the three articles to stand as the historical basis, but to add the following as explanatory of the conditions of fellowship in the future:

The conditions of fellowship shall be as follows: (1) The acceptance of the essential principles of the Universalist faith, to wit: (a) the universal fatherhood of God; (b) the Spiritual authority and leadership of His Son, Jesus Christ; (c) the trustworthiness of the Bible as containing a revelation from God; (d) the certainty of just retribution for sin; (e) the final harmony of all souls with God. The Winchester Profession is commended as containing these principles, but neither this nor any other precise form of words is required as a condition of fellowship, provided always that the principles above stated be professed. (2) The acknowledgment of the authority of the General Convention and assent to its laws.

In 1870, in the organizing of the Universalist churches of America, the church adopted the plan under which the United States have organized. This General Convention has supervision over the work of the denomination, meets once in two years, has a board of 11 trustees to carry on the work between convention sessions. The women of the church also have a national organization known as the Woman's National Missionary Association, which holds funds and carries on missionary work, chiefly in the South and West, and supports the Blackmer Home for Girls in Japan. In 1880 the young people of the church formed a national organization, the Young People's Christian Union. Funds raised by this support churches in the West and South. It publishes a weekly paper at Boston, the *Onward*. Under the administration of the General Convention are several commissions, such as the

Sunday School Commission, the Social Service Commission, the Commission on the Ministry, and the Educational Commission. All have their own officers and initiate work in their several lines. In Boston is the Universalist Publishing House, which publishes weekly the *Universalist Leader*, the *Sunday School Helper*, and the general literature of the denomination. Local Universalist papers are published in several States and by individual churches. The missionary work of the church is supported by the income of funds and quotas assessed on parishes. The most important foreign mission is in Japan. It was started in 1890 and now has schools and churches and many American and native preachers and teachers. There are now three colleges and four academies under the auspices of the denomination, having funds (1915) \$5,860,000, professors 333, students 3100. The theological schools maintained are (1) the Canton Theological School, opened at Canton, St. Lawrence Co., N. Y., in 1858. Although affiliated with St. Lawrence University, the theological school is a separate institution in its management and property, (2) Crane Theological School, affiliated with Tufts College, Medford, Mass. This was established in 1868 as Tufts Theological School, but was changed to the name of Crane Theological School in 1898, in honor of an endowment from Albert Crane of Stamford, Conn. (3) In 1881 a theological department was opened in Lombard College, Galesburg, Ill., and in 1890 its name was changed to the Ryder Divinity School, in honor of the late Rev. William Henry Ryder, D.D. In 1908 the school was removed to Chicago, where it became a part of the University of Chicago, though still retaining its name.

The church statistics for 1916 show 763 church organizations, 628 ministers, 55,000 church members, 250,000 parish members, 43,211 Sunday-school members, 11,306 members of the Young People's Christian Union, and \$19,377,640 church property.

Goodness of God (Boston, 1904). There are also a number of published discussions and debates between advocates and opponents of Universalism, as those by Ely and Thomas (New York, 1835); by Campbell and Skinner (Utica, N. Y., 1840); by Holmes and Austin (Auburn, N. Y., 1848); by Sawyer and Westcott (New York, 1854). The chief periodical of the church is the *Universalist Leader* (Boston, weekly).

UNIVERSAL JOINT, IN MOTOR VEHICLE. See MOTOR VEHICLE.

UNIVERSAL LANGUAGE. Need for a means of international communication has been felt from the earliest times. It is obviously impossible for one to acquire more than a few languages at most, and they are used correctly only by those gifted with exceptional linguistic ability. As a response to a desire of this nature it is quite possible that the so-called *Lingua franca* (q.v.) arose. In early times Phœnician (see PHœNICIAN LANGUAGE) served as a means of intercommunication among the traders of the Mediterranean, while in the Middle Ages Latin was the common learned language of Europe. But with the growth of the spirit of nationality in the period of the Renaissance, as well as because of the realization of its unsuitableness for the expression of modern thought, Latin was gradually discarded in favor of the vulgar tongue. It was soon found that extensive increase of commerce and the development of scholarship rendered the need of an international language more imperative, and in the seventeenth and eighteenth centuries various language systems were proposed, while in the nineteenth century their number is so great that it is not possible to enumerate them here. (See INTERNATIONAL LANGUAGE.) Though French as the language of diplomats has been offered by some as a substitute for a universal language, scholars were quick to realize that the selection of a living tongue would arouse unnecessary international jealousy. Likewise it is a truism that all languages present difficulties of a more or less serious nature to the learner. The Chinese language (q.v.), e.g., though apparently simple in structure, would require years of study for the average European, while English and French can be seriously objected to because of their unphonetic spelling. On the other hand the most successful language systems proposed, such as Volapük, Esperanto (qq.v.), Bolak, and Idiom Neutral, are met with the fundamental objection that they are based on modern European tongues and are unfit as universal languages because they do not contain the characteristic elements of any of the important groups of languages spoken on other continents. Yet it may be advanced in their favor that it is absolutely impossible to create a language that would be equally easy to be acquired by speakers of all known dialects, and that they certainly demand less effort on the part of the learner than any modern spoken language.

UNIVERSALS. Characteristics or attributes of objects when regarded as common to an indefinite number of individuals. There have been philosophers who denied the real existence of universals (see NOMINALISM), and others who asserted that universals exist apart from and prior to the objects they qualify. The problem of the nature of the universal is one of the most difficult and most mooted questions of philosophy. See LOGIC; REALISM.

UNIVERSITY (Lat. *universitas*). A term which, as originally used, denoted any corporate body, community, or association regarded as a whole. In its modern sense, that of a corporate body devoted to study, teaching, and investigation, the term came into use in the fourteenth and fifteenth centuries. The institutions first so designated in this modern sense of the term came into existence some two centuries before the common use of the term, and others somewhat similar had existed in ancient times under Greco-Roman influence. There was at Athens, at the time of the Roman Empire, a university not only in all the essentials of a great centre of learning, but one that closely corresponded even to what we now mean by that word. Schools of philosophy and letters similar to those at Athens sprang up at other great cities of the Roman Empire—at Constantinople, at Alexandria, at Rhodes, at Marseilles, at Apollonia (Illyria), and at Rome itself. These, however, had little or no influence on mediæval institutions.

Mediæval Universities. The university, in a modern sense, originated during the twelfth and thirteenth centuries, as an outgrowth of schools existing prior to that time in connection with cathedrals and monasteries. Throughout the eleventh and twelfth centuries there had grown up a new interest in dialectic, logic, and philosophy through the many theological controversies aroused by the earlier schoolmen and the heresies of the times; in Roman law through the controversies between the Holy Roman Empire and the Italian municipalities and the growing importance of canon law in Church administration; and in medicine on account of the Crusades and the contact with the East and with Saracen learning. When a teacher of eminence appeared, such as Abélard or Peter Lombard at Paris, or Irnerius at Bologna, a large number of students were attracted. This student body is said to have numbered 30,000 at Paris at the time of Abélard. Such a place of learning and concourse of students was called a *studium*, or later a *studium generale* to distinguish it from the more selected *olientèle* and function of the monastic or cathedral school. The addition of the subject matter of philosophy to the previous religious discussions, the new methods of treatment, and the greater freedom of thought were responsible for the building up of the first universities of northern Europe, and the most influential of all mediæval universities, that of Paris. The students were no longer necessarily destined for monastic or clerical life, though many were. At least the discipline was much less strict, and the students would not adapt themselves to the rigid rules of monastery or cathedral. They were no longer drawn from a restricted area, but were admitted from any region, and numbers flocked to schools in foreign lands. Civil and canon law, medicine, and theology were now added to the seven liberal arts.

The determining characteristic of the universities, however, was their specialization; each of the earlier universities was especially strong in some one line. At Salerno, in southern Italy, early in the eleventh century, the monks had given special instruction in medicine, and the fame of this new seat of learning spread with the First Crusade. During the twelfth century great attention was paid to the study of Roman law, especially in northern Italy, where the instruction centred in Bologna—notably so during the life of the great teacher Irnerius. In Paris

theology was the subject of interest, though the majority of pupils there were students of the liberal arts, not yet qualified for the study of theology. These groups of students and teachers, drawn together from distant regions, were controlled by no monastic rules, amenable to no political authorities, and practically without protection in their rights and privileges if any then existed. Organization was necessary, and the natural tendency was to organize on the basis of nationality. The nations were the first organizations, and they, through their delegated officers, made the central organization of the body as a whole. Even before organization, as well as afterward, such a body of students was termed a *studium generale*. To the organization the term *universitas* (corporation) was given, but never by itself alone. The terms most frequently used were *universitas magistrorum*, or *universitas magistrorum et scholarium*, or *universitatis collegium*. In the course of time the various nations and faculties, each at first a *universitas*, were united into one, the distinctions between the terms *studium generale* and *universitas* were lost sight of, and the latter term was used alone to indicate the general body instead of the constituent parts.

One great difference existed between the universities of southern and those of northern Europe. In the former, modeled after Bologna, the students constituted the corporation; in the latter, modeled after Paris, the teachers controlled, if they did not always completely constitute, the corporation. The reason for this distinction was that the students of the southern universities, especially of Bologna, were mature students of law, capable of self-government, both on account of their age and the subject of study; while in the North they were the more youthful students of arts, many entering Paris at the age of 12 or 13.

The privileges which built up the universities were either local, bestowed to prevent removal elsewhere, or general, constituting them integral parts of church and state. The state exempted members of universities from financial and military services, save under exceptional circumstances; the church bestowed the privilege of clergy and the right to teach. When the student had demonstrated his ability to determine and to define the terms in the prescribed trivial (see *TRIVUM*) texts, he received the bachelor's degree. When he had demonstrated his ability to conduct a disputation, i.e., an exposition of the more advanced texts, through a public defense of a thesis, the master's or doctor's degree was conferred. This entitled the recipient to teach within the limits of the university. Towards the end of the thirteenth century Pope Nicholas III granted to the University of Paris the right of endowing its graduates with permission to teach everywhere, a privilege later conferred upon most universities. The degrees themselves were similar to and probably borrowed from the corresponding stages in the learning of a craft or in the organization of chivalry. The earlier stage was an apprenticeship, the close of which was marked by the conferring of the bachelor's degree; the following was a journeyman's period, during which the candidate pursued his studies, and at the same time practiced his art by teaching the younger students the trivial studies. The master or doctor had the right to teach at least in his own and usually in any university; during the earlier period he

was under obligations to teach in his own. In time it became customary to endow a select number of the graduates as permanent public teachers; these privileged and salaried graduates were designated professors, and instruction by professors more or less supplanted the original plan of teaching by graduates. The privatdozent of the German universities now represents the modification of the old regent graduates.

The term "faculty" was originally used in the most general sense of science or knowledge; later to indicate a department of study, as the faculty of arts. Then a more special connotation became not unusual, as synonymous with the *consortium magistrorum*, or council of masters. By ordinary usage, however, the term was applied to the subordinate corporation of masters, or of masters and students in particular departments of learning. The University of Paris had at first only a faculty of arts, which existed in an organized form as early as 1169. In the thirteenth century faculties of theology, medicine, and canon law were added. These, with the faculty of civil law, constituted the organization of the typical mediæval university, though not all universities had all faculties represented even at the Renaissance period. The primary units of organization of the universities were the nations, though by the fourteenth and fifteenth centuries these were succeeded in importance by the faculties. In Paris the Faculty of Arts was divided into four nations, known as French, Picard, Norman, and German or English. After the thirteenth century these four nations, under their respective procurators, and the three faculties subsequently added, under their deans, constituted the seven component parts of the university. The procurators and deans elected the rector of the university, its highest officer, who possessed executive authority of a delegated nature. The rector with the procurators and the deans formed a court having cognizance of all matters relating to discipline, from which there was an appeal to the university and thence to the Parlement of Paris. The chancellor, after the rector, was the highest in authority, though that authority was confined to the conferring of degrees. Originally the chancellor was the immediate representative of the archbishop, to whom had previously belonged the right of conferring the privilege of teaching. Details of organization, as well as designations of the officers, varied considerably in the early universities, though in general they were all modeled on Paris or Bologna. In the latter city the *universitates* were to be distinguished from the *collegia*. The former were two in number, the *ultramontani* and the *citramontani*, which were composed exclusively of the students of law organized into constituent nations, thirteen in one case and fourteen in the other, each presided over by its procurator and counselors. The *collegia* were organizations of professors and doctors that had control of the conferring of degrees. These colleges were of the doctors of civil law, doctors of canon law, doctors of medicine, and, from the middle of the fourteenth century, doctors of theology. The general control of the *studium generale*, however, was in the hands of the universities later combined into one.

The colleges, as they developed in other countries, were quite different institutions from those of Bologna. They arose through provisions that were made for poor students in connection with hospitals or monastic foundations. The neces-

sity for some more domestic supervision of young students, combined with the other tendency, led to the foundation of Halls. These in turn were endowed with corporate privileges as well as property, and the term "college," previously a general term as *universitas* itself had been, was appropriated by these institutions. They soon assumed the character of boarding houses for all classes of students, where they were privately trained and prepared for public lectures. In some universities the lectures came to be given in the college, first the extraordinary, then the ordinary, until the general university lectures almost disappeared, and no student was admitted except as a member of a college. Many of these colleges were identified with particular faculties, or even departments of faculties. Probably the earliest college of all, which served as a type for the others, was the college of the Sorbonne (q.v.), founded about 1250 in the University of Paris, which came to be identified with the theological faculty.

Details concerning the early history of the universities, their development, and their present organization will be found in the articles on the individual universities. The early organization of universities has been best adapted to the needs of the present by the German universities, and is more specifically treated in that section.

England. These universities are of two distinct types: those that date from the Middle Ages, Oxford and Cambridge, and those founded during the nineteenth century. The two former have had a profound influence upon national development and national life, for in no other country have universities been more intimately connected with the religious, political, and literary development. The details of the history and present organization of these two universities, with the literature of the subject, will be found under the titles OXFORD UNIVERSITY and CAMBRIDGE UNIVERSITY OF. During the nineteenth century four universities of the modern type were founded, all laying stress on the study of the sciences and the technical branches. These are Durham University (1832), University of London (1836), Victoria University (1880), and Birmingham University (1900). Birmingham University was organized on plans similar to those of London and Victoria universities, with Mason College as a nucleus. The university is governed by a chancellor, principal, and a court of governors consisting of the faculties or certain members thereof. Four faculties have been established, arts, science, medicine, and commerce, but degrees are also to be given in science and engineering. The aim in its establishment is to bring university work into more direct relations with industry and commerce. The university began work in 1902 with the Rt. Hon. Joseph Chamberlain as chancellor. The example set by Birmingham was soon followed by other large commercial centres, though there is a little variation in the organization of faculties, schools, or departments. In 1903 Liverpool University was developed from Liverpool University College, of Victoria University. Victoria University now limited its authority and activities to Manchester. The University of Leeds followed, and in 1905 the University of Sheffield was added as the sixth of the modern universities of England. To this number must be added the University of Bristol, the University of Wales, with its constituent col-

leges, and a number of university colleges affiliated with the universities of Oxford, Cambridge, or London, e.g., Exeter, Reading, Southampton, and Nottingham.

Scotland. Scottish universities were mostly founded during the fifteenth century. The mediæval character clung to them until 1858, when by statute the universities were reorganized. See SAINT ANDREWS; ABERDEEN; GLASGOW; EDINBURGH, UNIVERSITY OF.

Ireland. Irish universities are those of Dublin, the National University of Ireland with its constituent colleges in Dublin, Cork, and Galway, and the University of Belfast. See DUBLIN, UNIVERSITY OF, and NATIONAL UNIVERSITY OF IRELAND.

Canada. Canadian universities have increased rapidly in numbers with the development of the western provinces. There were, in 1916, 19 degree-granting institutions, and some 12 other colleges, usually denominational in character, which are affiliated to those granting degrees. The leading universities are Toronto, McGill, Queen's at Kingston, Laval in Quebec, Acadia and Dalhousie in Nova Scotia, and the provincial universities of Alberta, British Columbia, Manitoba, and Saskatchewan. See under CANADA.

Australia. Universities exist at Sydney, Melbourne, Adelaide, Brisbane, Perth, and at Hobart in Tasmania. The first was founded in 1852 and is affiliated with the University of London and with a women's college (1894). There are four faculties—arts, law, medicine, and science, and chairs of military science, dentistry, agriculture, and engineering. In 1914 the student body numbered 1227. The University of Melbourne was established and endowed by an act of the Victorian Parliament in 1855. There are three affiliated colleges in connection with the Church of England, the Presbyterian and the Wesleyan churches. The student attendance in 1913 was 1244. The University of Adelaide was incorporated in 1874 and was the first in Australia to grant degrees to women (1880). Faculties are organized in arts, sciences, medicine, law, and music. The number of matriculated students in 1913 was 459. The University of Queensland, which was established in Brisbane in 1910, has faculties of arts, science, law, medicine, and engineering. The number of students in 1914 was 151. The University of Western Australia at Perth was opened in 1913 and has faculties of arts, science, and engineering, attended in 1913-14 by 186 students. The University of Tasmania was founded at Hobart in 1890. It consists of three faculties—letters, science, and law—and in 1913-14 had 107 students.

The University of New Zealand was founded in 1871 and later empowered to confer degrees in the arts, science, law, medicine, dentistry, architecture, engineering, commerce, agriculture, veterinary science, and music. In 1874, by union with the University of Otago (founded in 1869), the functions of the former institution are restricted to its giving examination and conferring degrees, while the latter became an affiliated college. A college of mines was later established. The attendance in the constituent colleges at Dunedin, Christchurch, Auckland, and Wellington was more than 1500 in 1914.

India. The universities of India, with the dates of their establishment, are as follows: Calcutta, 1857; Bombay, 1857; Madras, 1857; Punjab, 1882; and Allahabad, for the Northwest Pro-

vinces (United Provinces of Agra and Oudh), in 1887. By the Indian Universities Act of 1904 all the universities were given the same form of organization. For the most part the instruction is given in affiliated colleges. Faculties in arts and philosophy, medicine, law, science, commerce, Oriental studies, teaching, and engineering exist. Efforts are being made also to promote technical and agricultural education, the supporters of this plan hoping to establish strong provincial institutions for these purposes. Instruction is usually given in English, though in the Oriental College of the Punjab University instruction is in the vernacular. All the universities enjoy the privilege of affiliation with the University of Cambridge.

France. French universities take their origin from the University of Paris, the first great university of northern Europe. (See PARIS, UNIVERSITY OF.) In the greater part of the nineteenth century the word "university" had a widely different meaning in France from that which it conveyed in other countries, the term *Université de France* being nearly equivalent to national system of education of France. (With this may be compared the University of the State of New York.) The French Revolution put an end to the universities of the *ancien régime*, and the attempts of the Convention to establish similar institutions were short-lived. Napoleon organized a comprehensive system of higher education in one unified whole—the University of France. This was placed directly under the control of the government, administered from Paris, and made an instrument of government in the hands of the central power. Higher education was given under 15 faculties in each of the educational districts. These faculties were preëminently examining and degree-conferring bodies. The courses of study were strictly controlled from Paris, and the work was almost wholly of a professional and practical character. This organization, with various alterations, continued until 1896. While the various faculties of law, theology, medicine, science, and literature existed in most of the different educational districts, the so-called academies, in no case save at Paris were they organized into a university. The Law of 1896, which went into effect Jan. 1, 1898, created 15 autonomous universities in place of the previous unified university with scattered faculties, to which a sixteenth was later added in Algiers (1909). While much of the control of the institution is still exercised by the Minister of Education and the authorities at Paris, yet much local autonomy is exercised in respect to examinations, degrees, and supplementary courses of instruction. The support of these institutions is now left largely to the localities, with large subsidies from the state. This stimulates local pride and activity, and many of the localities have made great additions to the material equipment and plant of the institution. Private munificence can now also be accepted, and it has been given in some instances. The universities in the smaller towns, however, have suffered considerably from the change, for while the change has largely increased the student attendance, yet this has been for the most part to the advantage of the universities in large cities, such as Paris, Bordeaux, and Lyons. The local universities are also under the necessity of supporting the course of study given outside of the state programme.

ARRANGED BY GARDNER COTRELL LEONARD, B. A., INTERCOLLEGIATE BUREAU, ALBANY, N. Y.

The reform of 1896 was quite as important in regard to methods of study as in regard to administration. New emphasis is laid upon the work of investigation. The professional student is now given an opportunity for doing this, and in some faculties is expected to do it previous to receiving a degree. The change has especially benefited the faculty of science and arts, which previously had had no regular students, since all courses were public and free and were consequently attended chiefly by chance comers. The same reform provided for the opening of the universities to foreigners and the reestablishment of the doctorate. The attendance of foreigners, especially Americans, has increased constantly since the reforms were instituted, there being, in 1912, 5569 of these. The number of professorships has also been largely increased. Not all the universities are equipped with all the faculties. There are only eight complete faculties: Paris, Bordeaux, Lille, Lyons, Montpellier, Nancy, Toulouse, and Algiers. A few have no complete medical faculties and only preparatory medical schools. In addition to the faculties a number of universities have also schools of pharmacy.

Germany, Austria, and Switzerland. The early German universities were modeled after the University of Paris, though the University of Bologna had considerable influence on the universities of the South German States; and it is in the German universities that the general organization or structure of the mediæval universities is best preserved. Unlike the early universities of France and Italy, those of Germany were not of gradual growth, but were all created and chartered by both King and Pope and often by the Emperor as well. There were seven of these founded in the period to which all the early universities belong, that is, to the period previous to the Renaissance movement. The earliest of all was that of Prague, authorized by Pope Clement VI in 1347, and by the Emperor Charles IV in the following year. Then followed Vienna, in 1365; Heidelberg, in 1386; Cologne, in 1388; Erfurt, in 1393; Leipzig, in 1409; and Rostock, in 1419. It is only this group of German universities that incorporated the original organization into nations, and even in these the nations ceased to have any essential importance in the sixteenth century. Leipzig grew out of a secession of 5000 students and teachers from Prague, owing to hostility between the German and Bohemian students, and consequently the organization into nations was important, and continued to exist as a form until the nineteenth century. All these universities yet exist, save Cologne and Erfurt, which disappeared during the period of the French Revolution. The humanistic movement of the fifteenth and early sixteenth century produced nine new universities, four of which, Greifswald, Freiburg, Basel, and Tübingen, still exist. One of the others, Wittenberg (founded 1502), was the most influential of all during the latter part of the sixteenth century.

The third period in the history of German universities is that of the Reformation and Counter-Reformation, to the close of the seventeenth century. Twenty new foundations date from these two centuries, 10 of them Protestant and 10 Roman Catholic. Half of each group have ceased to exist or continue merely as theological faculties under the control of the Church. These foundations were due for the

most part to the territorial divisions caused by the religious dissensions, and throughout the period religious interest dominated all the universities, old and new. Consequently the influence, the spirit of the teaching, the manner of life was much more restricted during this period than in any other. The theological studies dominated. Towards the close of this period the universities of Germany sank to the lowest level of influence and importance, nor was the character of the work much higher. The court schools and circles of learning outshone the universities themselves.

The new era of the eighteenth century was ushered in by the foundation of Halle (1693) and Göttingen (1737). These two institutions marked the recovery from the stagnation of the seventeenth century. Halle was established in the interest of Lutheranism to combat some of the religious tendencies of the time, but soon outgrew the bounds originally set for it, especially under the influence of the famous Thomasius and Francke. Thomasius was the first to abandon the use of Latin for German in the lecture room, and his example was soon followed to a greater or lesser extent throughout Germany. A further characteristic of this period was the dominance of the new rationalistic philosophy over the old scholasticism. The new philosophy recognized no bounds of authority, and the spirit of inquiry now came to be the dominant spirit of the universities. Instead of the merely formal study of the ancient classics, the various branches of philology were now recognized and pursued. The critical study of history also began. Halle and Göttingen dominated the eighteenth century and are recognized as the first universities of the modern type.

The present period, in which the scientific spirit of the nineteenth century is preëminent, opened after a period of upheaval consequent upon the Napoleonic wars. Nine of the old universities were suppressed and four combined with others. One of the measures adopted by the Prussian government was the reformation of existing universities in the direction of greater freedom of thought, and the founding of the new University of Berlin in 1809. The influence of Berlin on other German universities has been paramount. Many antiquated and useless features have been abandoned and during the past century professorships in every branch of learning were established. The University of Bonn was founded in 1818 and has rapidly gained preëminence, especially in philosophy and philology. A late venture in the progress of higher education in Germany was the establishment of the University of Frankfurt, the first institution of its kind maintained by private and municipal funds. The university was opened for instruction in 1914.

The German universities are strictly state institutions and are subject to the ministry charged with the educational supervision of the respective states in which each is situated. Each, however, enjoys a high degree of autonomy and their constitutions are essentially republican. The internal administration of the university is in the hands of a rector, or, in case this title is borne by the sovereign, a pro-rector, a dean of each faculty, the *senatus academicus*, and the quæstor or treasurer. The discipline of the university over its students is maintained by means of a University Court, composed of certain members of the faculty or

law. The penalties inflicted are reprimands, fines, imprisonment in the University *Carcer*, deprivation of credit, suspension, and expulsion, the two latter holding good not only for the one but for all German universities. Aside from this the university exercises no control over its students, and there are, save in a few exceptional instances, no such institutions as colleges, halls, or dormitories. The term faculty signifies either (1) the teaching body, especially the full professors, or (2) the teachers and students in one of the great divisions of the university. At every German university there are faculties of law, medicine, philosophy, and either Protestant or Roman Catholic theology. In a few, such as Munich and Strassburg, an additional faculty in political science or in natural science has been organized. The teaching body of a German university consists of (1) full professors (*ordinarii, ordentliche Professoren*), (2) extraordinary professors (*ausserordentliche*), and (3) *Privatdozenten*. To these are to be added (4) readers (*lectoren*), appointed to give practical instruction in modern languages; there are also (5) masters of dancing, fencing, riding, etc., whose connection with the university is often merely nominal. The full professors are the occupants of chairs intended to be permanent foundations; they alone sit in the *senatus academicus*, and are alone eligible to the rectorship and deanships. The extraordinary professors are either younger men, to whom the professorial title has been granted by the government for distinguished work, or they represent subjects in which no permanent chairs have been established; sometimes both conditions are exemplified in the same individual. The *Privatdozenten* are graduates who receive permission to lecture, but receive no official appointment and depend for their remuneration for the most part upon fees received from students. They are not subject to the authority of the professors, but from them are selected the *ausserordentliche Professoren*.

The only degrees given by the German universities at the present day are those of doctor and licentiate; the latter is given only in theology. The university degrees do not, as such, admit the recipient to the exercise of his profession in the Church, law, medicine, or the higher teaching service; for this, the passing of the state examination is necessary.

For a list of German, Austrian, and Swiss universities, see articles on the respective countries. The principal universities are described in separate articles.

Italy. During the Middle Ages the university movement had its origin and received its greatest impulse from Italy. The importance of Bologna in this respect has been discussed under the section on *Medieval Universities*. Again, during the fifteenth and sixteenth centuries the Italian universities were the most important centres in all Europe of the new humanistic studies. While the new methods and subjects of study introduced by these Italian universities produced a complete academic revolution and paved the way for the Reformation, they possessed a fortunate immunity from dissensions like those which distracted the centres of learning in northern Europe, especially Germany. The status of the professors in Italy was higher than in any other country. Nevertheless the universities suffered greatly from the general decline of the seventeenth and eighteenth

centuries and did not recover with the early nineteenth, as did those of the Northern European countries. While they preserved their ancient organization and local independence, they suffered both from a great decrease of revenue and from the political disturbances of the Italian States. After the political unification of Italy in 1870 the government nationalized the universities, by assuming their support and management and confiscating their property. Since that time the universities are included as a component part of the public system of education. There are seventeen of these state universities and four free universities—that is, supported by the local districts and municipalities. Consequently the opportunities for higher education are very much in excess of the needs of the population. Very few of these universities possess theological faculties, and the theological studies are little valued. Education for the Church is given in seminaries controlled by the Church and in its ecclesiastical character is most complete. The theological schools of Rome draw students from all quarters of the world, and in conjunction with them there is a system of national colleges for the students of the several countries. Faculties of philosophy do not exist in the free universities and are poorly attended in the state institutions. The faculties of medicine and of law possess an overwhelming preponderance of all students. The state universities are those of Bologna, Cagliari, Catania, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Pisa, Rome, Sassari, Siena, and Turin. The free universities are those of Camerino, Ferrara, Perugia, and Urbino.

Holland and Belgium. The universities of the Netherlands, which, like the later foundations of Germany, grew out of the Reformation struggles, were founded by the state for the especial purpose of training the clergy.

The Dutch universities are Leyden, Groningen, Utrecht, and Amsterdam, the last founded in 1877. These universities possess a uniform organization and with the exception of Amsterdam, which is not state maintained, are completely controlled by the state. The subjects of study and the examinations are determined by statute. Consequently there is little individuality among the universities and little to lead a student to prefer one institution to another. There are no colleges or halls, and no oversight of the students by the faculty. The Dutch universities are closely modeled after the German, but do not possess their flexibility. The character of student life, of methods of instruction, of conditions of examinations, of degrees conferred, closely approximate that of the German universities. There is in addition to these a free university at Amsterdam founded in 1880 and now having about 150 students in faculties of theology, letters, law, and medicine. It is supported by private benefactions.

Belgium had four universities, two of which, Liège and Ghent, were state universities similar to those of the Netherlands, while Louvain was controlled by the Roman Catholic church, and Brussels was a free establishment.

Spain and Portugal. There were in 1916 nine universities in Spain, an additional law faculty at Oviedo, and a medical faculty at Cadiz. The universities are located at Barcelona, Granada, Madrid, Salamanca, Santiago, Seville, Valencia, Valladolid, and Saragossa.

Each possesses two or more of the faculties of law, medicine, pharmacy, and science. Tuition charges are high and the universities depend almost wholly upon this source of revenue. For the most part the Spanish universities resemble in organization the French faculties previous to the reforms of 1896 and are not in a flourishing state. The largest is that of Madrid, with 125 professors and nearly 6000 students in 1914. Portugal has two universities. There are faculties of law, medicine, mathematics, philosophy, and a school of design at Coimbra. Lisbon, which was reestablished in 1910, has faculties of arts, sciences, and medicine, and a school of pharmacy. See COIMBRA, UNIVERSITY OF; ALCALÁ DE HENARES; MADRID, UNIVERSITY OF; SALAMANCA, UNIVERSITY OF; VALENCIA, UNIVERSITY OF; VALLADOLID, UNIVERSITY OF.

Russia. Russian universities are of two classes: those that are practically universities of the German type and date from the Reformation period, and those typically Russian. There are two of the former: Dorpat, founded in 1632 (see YURIEV, UNIVERSITY OF), and Helsingfors, in Finland, founded in 1640 by Queen Christina. The latter is a flourishing institution in the midst of a cultured people possessing a system of universal and compulsory education. Both the population which supports it and the institution itself are more closely allied to the Scandinavian countries than to Russia. The nine Russian universities are as follows: Moscow, founded in 1755; St. Vladimir at Kiev, founded in 1833; Kazan, founded in 1804; Kharkov, founded in 1804; Warsaw, founded in 1816; St. Petersburg, founded in 1819; Odessa, founded in 1865; Tomsk, founded in 1888; and Saratov, founded in 1909. In most of them the faculties are of history, science, jurisprudence, medicine, and languages. The attendance, excluding Saratov with about 400 students, varies from about 10,000 at Moscow to about 1000 at Tomsk. In addition to the universities there are six theological schools and various medical and technical schools not represented in the university faculties.

Greece. No institutions of higher learning existed in Athens during modern times until after the liberation of the Greeks in the early part of the nineteenth century. In 1837 King Otho established the University of Athens, closely modeled after the universities of Germany. The four faculties of law, medicine, theology, and philosophy were created, with the power of appointment lodged with the King, who appointed mainly Germans. Since 1882 the right of nomination has been exercised by the faculties.

Scandinavia. All state institutions since the Reformation have been strongly Lutheran in their character and are closely associated with the national church. They were founded on the model of German universities and for the most part reproduce the present features of these. They are as follows: Upsala, in Sweden, founded in 1477; Copenhagen, in Denmark, founded in 1479; Lund, in Sweden, founded in 1666; and Christiania, in Norway, founded in 1811. The attendance varies from 4000 at Copenhagen to nearly 1400 at Lund. In addition to these universities there are in Sweden a state medical faculty at Stockholm, and private philosophical faculties at Stockholm and Göteborg.

United States. In the United States popular

usage employs the terms "university" and "college" indiscriminately for any higher institution of learning which possesses the power of conferring the usual academic degrees. This confusion prevails also in official nomenclature, for some of the oldest, richest, and most completely equipped American universities still bear the name of "college," while in certain parts of the country institutions inferior in endowment and in scholarly distinction to some of the secondary schools are officially designated as "universities." Harvard and Yale, though long since equipped with the amplest facilities for university work, have only very recently put aside the name of "college," and the same is true also of Columbia and Princeton.

Classified with reference to their pedagogic character, American universities may be roughly grouped under two general heads: (1) universities that are equipped for the prosecution of original investigation and research in the various departments of study, besides usually having connected with them the various professional schools, representing the faculties of law, medicine, theology, and natural science; and (2) universities, so called, that perform chiefly the disciplinary and preparatory work similar to but somewhat more advanced than that of the German Gymnasium (q.v.). Institutions of the second class have a course more or less prescribed (see ELECTIVE COURSES AND STUDIES), leading to the degree of bachelor of arts, and in some cases to the alternative degrees of bachelor of science, bachelor of letters, or bachelor of philosophy. With the granting of such degrees the responsibility of the institution usually ends, though some of the universities offer facilities for advanced lines of study. But in all, the "undergraduate courses" leading to the baccalaureate degree form the most important portion of the curriculum.

Of the former class, to which in the best usage the term university is now restricted, are Harvard, Yale, Columbia, Princeton, Johns Hopkins, Clark, Pennsylvania, Leland Stanford, Chicago, Cornell, New York, the Catholic University of America at Washington, and a large number of State universities such as Michigan, California, Wisconsin, and Illinois. However, in most of these less stress is laid upon the collegiate work than upon the more original work performed by those who have already received the first degree in arts and science, and who are consequently engaged in the special or professional investigations that are to fit them for their life's work. In the remainder of these, and in many similar institutions bearing the name university, the chief emphasis is upon the undergraduate work, though the advanced and progressive work is also represented and the title of university is appropriate. Such are the State universities of Virginia, California, Michigan, Indiana, Minnesota, and several other States, Boston University, and Princeton University. So far as the advanced work is carried in these institutions, it is in no wise inferior to that of institutions laying the chief stress on graduate investigation and instruction. In no case is there an institution comparable to the universities of Oxford and Cambridge, made up of constituent colleges doing undergraduate work; nor, on the other hand, universities in the German sense of the term.

The influence of the German universities, however, was most instrumental during the devel-

opment of advanced instruction in American institutions. The first American to graduate at a German university was Edward Everett, who received his doctor's degree at Göttingen in 1817. During the next few years this example was imitated by four or five others, among them George Bancroft, who received his degree in 1820. Not until after 1840, however, were any great number of American students attracted to the German universities. From that time a constantly increasing number pursued such a course and returned to affect immediately the work of American institutions. As early as 1800 Harvard College had accepted resident graduates, and announced their names as students. A varying number, never over 12, continued each year until 1860, when Harvard first definitely announced in its catalogue that such students would be accepted and provided for, and three years later announced a series of graduate courses.

Meanwhile Yale College had preceded Harvard in the development of graduate work. In 1847 a "department of philosophy and arts" was organized for "scientific and graduate study." This department was expanded until in 1860-61 it was divided into (1) the Sheffield Scientific School and (2) the special courses in philology, history, philosophy, etc., and the announcement was made that the degree of doctor of philosophy would be conferred, as was done for the first time at the close of that year. In 1872 the graduate work was organized into a separate department, as the first distinct graduate school. In the same year Harvard announced that it would confer the advanced degree, but it was not until 1890 that a separate graduate school was organized. Other institutions, such as Columbia, Michigan, Cornell, and Princeton, soon followed the example of the older institutions in providing for advanced degrees and in the case of the master's degree some even preceded the older institutions. In the case of Cornell University, opened in 1868, the graduate work and graduate degrees were planned from the beginning. Johns Hopkins University, founded in 1876, was the most influential of all factors in developing university work similar to that of the German universities. Here first was found an institution devoted chiefly to the training of advanced students; here first were found the opportunities for research along the line of all the social and natural sciences, literature, and philosophy; here first was the organization of work similar to that of German institutions and the same freedom and opportunity of wide choice given to the student. For many years the men trained at this university exerted the greatest influence towards the introduction of similar work in other institutions where the university work was developing out of the old collegiate work. A second great influence was that exerted by Harvard University during the incumbency of President Eliot. Nowhere else was the close and beneficial relationship that may exist between the graduate and undergraduate work so demonstrated. A similar influence was exerted upon State universities by the graduate instruction both in natural and in the social sciences by Cornell University, ample provisions for which were made at its foundation in 1868. More recently several other institutions have vied with these in the importance of their university work, notably two, which now lead all

the others in graduate attendance, namely, Columbia University and the University of Chicago. Columbia as reorganized in 1890 provided for graduate work, in a graduate faculty of philosophy, of political science, and (in 1893) of pure science. Since then the faculty of medicine and the faculty of law and the faculty of education (see TEACHERS COLLEGE) have become graduate faculties. In numbers pursuing graduate studies this university now leads. The University of Chicago, founded in 1891, has laid the greater emphasis upon graduate work from the beginning, and has introduced a number of novel features, some imitations of features of English universities, some of German, and some original. Several of these, such as the continuous session, and the publication department, as an important phase of the university work, seem destined to come into general acceptance.

The degrees conferred by universities for advanced work are usually those of master of arts (A.M.) and doctor of philosophy (Ph.D.), though sometimes the master of science (M.S.) and the doctor of science (D.S.) are also given. The tendency now in both the graduate and undergraduate work of universities is towards giving a single degree (A.B., A.M., and Ph.D.) upon the completion of any one of a number of allied courses. The requirements for the master's degree show considerable variation among the different institutions. The degree usually indicates one year of resident graduate work beyond the bachelor's degree, though it is still frequently given *honoris causa*. The minimum for the doctor's degree is two years' work beyond the baccalaureate, including the preparation and usually the publication of a thesis. In most cases the doctorate requires three years of graduate work. In 1873 there were 43 doctorate degrees conferred, 25 of which were upon examination. By the close of the century this number had increased to from 300 to 350 each year, with less than five per cent given *honoris causa*. In 1914 in 567 institutions 5248 graduate degrees were conferred, while in 46 of the leading institutions 519 degrees of doctor of philosophy were gained. The graduate students in the same year numbered 13,094. See DEGREE.

Complete freedom of choice is naturally given to the student in the selection of his studies, as is now the usual or at least the frequent custom in undergraduate studies. (See ELECTIVE COURSES AND STUDIES.) Consequently the A.B. degree as well as the Ph.D. does not indicate the mastery of any particular subject or subjects. The German custom of requiring the student to select a major and one or two minor subjects prevails in most universities, though Harvard and Yale simply require that the kind and amount of the work be satisfactory to the appropriate committee. The present tendency in other institutions is away from this division into majors and minors. The amount of time or number of courses included in a major or minor varies with the university. A major for a doctor's degree ordinarily represents two courses of two or three or four hours weekly for two or three years, as the case may be. It is often more in amount. The minor is ordinarily one-half of the above requirement. The greatest variety of choice is offered the student for his selection of majors and minors.

The teaching staff is composed of professors, adjunct or associate professors, assistant pro-

fessors, instructors, tutors, and assistants. The American professor is always a teacher, and the amount of his time that must be devoted to actual lecturing and teaching is usually prescribed for him by the college regulations; it is ordinarily from eight to twelve hours per week. He has not the privilege accorded to the German professor, of "reading" or not, but must every year go through a certain number of courses of instruction, besides being expected, in many of the colleges, to assume a certain amount of responsibility for administration, and the morals and discipline of the undergraduates. This is a very serious obstacle in the way of his ability to carry on independent investigation and research, and makes the American professoriate a comparatively sterile body, though an improvement in this respect has been very noticeable in the past few years. The university instructor is now expected to be not only a director of investigation and an investigator himself, but he is also expected to publish the results of his investigations. The same kind of work is also coming in increased amount from the colleges, though there the instructor must spend the greater part of his time (from 15 to 20 hours per week) in class instruction. Harvard, Yale, Chicago, Cornell, Columbia, Johns Hopkins, Clark, and other universities have now largely adopted the German conception of the professorial function, and allow the individual professor much greater liberty in the discharge of his duties than was formerly the case. Most of the leading universities have likewise adopted the laudable plan of allowing each professor leave of absence once in seven years, either a full year on half pay, or a half year on full pay, with many variations on this plan.

In organization the universities differ considerably, especially as to detail and local arrangements. In general the organization is into faculties of philosophy, pure science, applied science, medicine, law, etc., presided over by deans, who are administrative rather than educational heads; the faculties are divided into departments, of Greek, mathematics, etc., presided over by a head professor, who usually exercises a general control over the work of the department. To him the associate professors, tutors, etc., in the department are responsible. He arranges the subjects of study, assigns the work of the subordinate instructors, and reports to the president or chancellor from time to time upon the work accomplished. In other universities the departmental organization is wholly democratic, in which the only headship is the formal one of seniority. The president (or chancellor) exercises a general supervision over the entire institution, and is the medium of communication between the faculty or faculties and the trustees, overseers, regents, or governors of the university—a body with whom usually rests the ultimate sovereignty of the institution, and who have exclusive control of the finances.

The organization of the professors and instructors in American universities differs widely. In the institutions where most of the work is in arts and science there is generally a single faculty. In the larger universities the faculties are often wholly distinct, the president acting as the only bond between them. Each faculty, then, legislates independently of the others on matters affecting its own local interests, while questions affecting the university as a whole

are left largely to the board of trustees, advised by the president and sometimes by the faculties.

The United States Commissioner of Education in his report for 1913-14 gives statistics for 567 universities, colleges, and schools of technology of degree-giving rank. Of these 474 are controlled by private corporations and 93 by State or municipal authorities. Four hundred and seventy-five of these are colleges and universities for men or for both sexes; of these 330 are open to both men and women, and 145 admit men only to the undergraduate department. The total attendance in these institutions for the year 1913-14 was 216,493; of these 139,373 were men and 77,120 were women. These institutions conferred degrees upon 31,781 men and women completing the course of study during that year. The number of professors and instructors in these institutions was 31,312. The total value of the property possessed by the 567 institutions of higher education was \$849,396,071; of this sum \$362,742,823 consisted of productive funds. The total income of the institutions for the year was \$102,156,401, and the additions through private benefactions, \$26,670,017.

Since the close of the last and the beginning of the present century a number of organizations have been established to promote and discuss the various interests of American universities. Among these should be mentioned the Association of American Universities, established in 1900 to consider questions bearing on graduate studies; the National Association of State Universities, organized in 1895, to make the represented institutions more efficient; and in 1914 there was founded the Association of Urban Universities to promote the interests of municipal universities and universities existing in large towns. The United States Bureau of Education has in recent years devoted attention through a specialist to higher education. Of privately endowed bodies that have contributed materially to the welfare of American universities the more important are the Carnegie Foundation for the Advancement of Teaching, and the General Education Board (q.v.). Indirectly contributory to the progress of higher education is the American Association of University Professors, organized in 1915 to safeguard and promote the interests of the teaching profession engaged in universities and colleges.

Denominational Connections of Universities and Colleges. The earliest institutions for higher education in the United States were established to promote the interests of certain denominations and more especially for the training of ministers. Thus Harvard and Yale were closely connected with the Congregational churches, King's College (now Columbia University) with the Episcopal church, Princeton with the Presbyterian, Brown with the Baptist, Wesleyan with the Methodist, and Rutgers with the Dutch Reformed. The expansion of the purposes and functions of the colleges and universities, the development of State universities, the requirements of the Carnegie Foundation for the Advancement of Teaching, were several among many reasons for the abandonment of close administrative relations between these institutions and the denominations. While nearly every denomination in the country has its representative institutions for higher education, a few have established central authorities to aid in the maintenance, promote the standards, and

supervise the instruction and religious life of their institutions. The chief of these boards are the Presbyterian Board of Aid for Colleges and Academies or the Presbyterian College Board, established in 1883; the Board of Education of the Methodist Episcopal church, organized in 1864; the Board of Education of the Methodist Episcopal Church South, founded in 1894; the Congregational Education Society, organized in its present form in 1896 and amalgamating a number of boards throughout the country, one at least dating from 1816; and the Board of Education of the Reformed Church of America, which began its activities in 1828, was reconstituted in 1832, and incorporated in 1869. All the boards mentioned are now devoting themselves to the task of consolidating and coordinating the efforts of their respective denominations, eliminating competition among small, struggling institutions, and raising the standards.

The ecclesiastical control over institutions of higher learning in the Roman Catholic church is of a different character. Here there is no central board or society that exercises powers of supervision over all the colleges of the church. The connection is maintained through a large number of religious orders that not only support but own the institutions under their care. Each order is, of course, under the supervision of its superior or council. In 1899 there was founded an Association of Catholic Colleges of the United States with a membership of 53 colleges, a number nearly doubled since that date. The association in 1904 became the college section of the Catholic Education Association. The leading institution in the section is the Catholic University of America (q.v.). With few exceptions the other institutions are under the control of one of the religious orders of the church devoted to teaching. The leading orders of men are the Society of Jesus, the Brothers of the Christian Schools, the Benedictines, the Vincentians, the Oblates of Mary Immaculate, the Marist Fathers, the Congregation of the Holy Cross, the Brothers of the Sacred Heart, and the Xaverian Brothers. The chief communities of women conducting colleges include the Sisters of Notre Dame, the Sisters of Notre Dame of Namur, Sisters of the Holy Cross, Sisters of the Holy Names, Ursulines, Sisters of Charity, and Sisters of Providence. The institutions maintained by these orders are chiefly of college rank and confine themselves in the main to imparting a liberal rather than a professional education. The leading universities are, besides the Catholic University of America, Georgetown (Washington, D. C.), Notre Dame (Notre Dame, Ind.), Loyola and DePaul (Chicago), St. Louis (St. Louis), Fordham (New York City), Creighton (Omaha), Marquette (Milwaukee), Detroit (Detroit). Catholic colleges having a registration in 1915 of 300 or more include: St. John's (Brooklyn), Holy Cross (Worcester, Mass.), St. Mary's (Oakland, Cal.), St. Ignatius's (Cleveland, Ohio), St. Mary's (Dayton, Ohio), Dubuque (Dubuque, Iowa), Cathedral College (New York City), St. Mary's (St. Mary's, Kans.), St. John's (a university; Collegeville, Minn.), Mt. St. Mary's (Emmitsburg, Md.), St. Viator (Kankakee, Ill.), Santa Clara (a university; Santa Clara, Cal.), Villanova (Villanova, Pa.), Campion (Prairie du Chien, Wis.), Christian Brothers (St. Louis), Loyola (Baltimore), St. Joseph's (Collegeville, Ind.). There are other well-known Catholic colleges in the United States, as well

as in the Philippines and Honolulu. For complete list, consult the *Official Catholic Directory* (New York, 1916).

UNIVERSITY CLUB. A social organization, whose members must hold a university or college degree, or one representing advanced education, and who need not all come from one institution. Clubs representing one institution alone are commonly called Alumni Clubs. The earliest University Club in the United States was the University Club of New York City, founded in 1865 and reorganized in 1879; the next the University Club of St. Louis, 1872. By 1915 the number in the United States had increased to over 60. The University Club of New York City is limited to 2000 resident members, 1500 nonresident and army and navy members, and a considerable number of life

members. The total in 1915 was 3531. The library contains over 32,000 volumes. Consult J. W. Alexander, *History of the University Club of New York City* (New York, 1914).

UNIVERSITY COLLEGE. A college of Oxford, England, reputed to have been founded by King Alfred. This tradition is repeated on three different occasions: once in a petition to King Richard II; again in 1727, when this tradition was made the ground for vesting the right of visitation in the crown; and as recently as 1872, when the college celebrated the millenary anniversary of the legendary foundation. The historical founder, however, is William of Durham, who died in 1249, leaving 300 marks for the purchase of annual rents for the use of some twelve masters. The actual foundation does not seem to have taken place until 1280, when the first statutes were drawn up. The present buildings of the college, which is situated in High Street, date from 1634; a number of changes and additions were made, however, about 1860. The hall was extended at that date and contains in the centre of its large fireplace a medallion bust of King Alfred. The library, built in 1860, contains large statues of Lord Eldon and Lord Stowell. The chapel was remodeled two years later. A chamber has been specially built to contain Ford's statue of Shelley, who entered the college in 1810. In 1913-14 the college had a master, 13 fellows, 33 scholars and exhibitors, and 195 undergraduates. Consult W. Carr, *University College* (London, 1902).

UNIVERSITY COLLEGE. The title of a large number of institutions of college grade throughout the British Empire. These institutions do not possess the privilege of granting degrees, but are in most cases affiliated with degree-granting universities. A number of university colleges have themselves been nuclei of universities, e.g., University College of Liverpool. The title is borne, e.g., by the University College, London (see LONDON UNIVERSITY); University College, Reading; University College, Exeter; University College, Southampton; University College, Nottingham. The University of Wales (see WALES, UNIVERSITY OF) consists of three university colleges, as does the National University of Ireland (q.v.). Consult *Yearbook of the Universities of the Empire* (London).

UNIVERSITY EXTENSION. A system of higher education for men and women who are unable to attend higher institutions of learning. University extension work was begun by the University of Cambridge, England, in 1872-73, when, largely owing to the zeal of Professor James Stuart, it offered to supply English towns with capable instructors in various departments of knowledge, under university supervision. The administration of this work was vested in a syndicate instituted in 1873. In 1876 university men in London founded the London Society for the Extension of University Teaching, which was, in 1902, made a department of the University of London. In 1885 the University of Oxford instituted its "Delegacy for the Extension of Teaching Beyond the Limits of the University." This action was the result of the success attained by several of the Oxford colleges in the establishment of "Extension Colleges" at Reading and other English towns. At the present time every university in England is engaged in extension work. Coördinate with the university extension movement is the work done by the Workers' Educational Association, formed

in England in 1903, to provide educational opportunities for working men "until they are able to take advantage of the facilities which are and which may be provided by the universities." The association arranges courses and secures leaders from the universities to meet local groups organized throughout the country.

University extension teaching has been introduced, sometimes modified, and carried on in the United States, Germany, France, Belgium, Austria, Denmark, Scandinavia, Russia, Australia, and Canada. In a few instances, notably in the State of New York and in Vienna, the enterprise has received government aid. But in general it has been supported by students' fees, assisted by college grants or private subscriptions.

United States. The subject of university extension was first publicly presented at a meeting of the American Library Association during their session in the Thousand Islands in September, 1887. The English system, as adapted to American local needs, was promptly taken up by librarians in Buffalo, Chicago, and St. Louis. In these and other cities the idea was gradually developed and extended by the co-operation of university graduates with libraries, churches, and other local institutions. In January, 1888, Melvil Dewey, then chief librarian of Columbia University, laid the plan before the regents of the University of the State of New York, and at the University convocation in Albany, July, 1888, advocated university extension in connection with public libraries. In February, 1890, a committee of New York colleges and universities urged the regents to establish, under State supervision, a system of extension teaching. On May 1, 1891, a bill was signed by the Governor of New York appropriating \$10,000 for the State organization of university extension. No part of the grant could be used for the payment of lecturers, but only for purposes of organization, supervision, and printing. This grant of \$10,000 is the first case on record of a State appropriation for university extension.

In 1890 a few public-spirited citizens of Philadelphia founded the American Society for the Extension of University Teaching. In 1891 followed the Albany movement mentioned above; and upon its opening in 1892, the University of Chicago established an extension division as one of the main departments of its work. Mainly from these three centres university extension in the United States has been carried on, though educational institutions elsewhere in the country have done similar work. Some of the more notable of these are: Johns Hopkins, Brown, Stetson (Fla.), and Northwestern Universities; the State universities of Wisconsin, Indiana, Iowa, Wyoming, Kansas, Michigan, Minnesota, Colorado, and California, etc.; Colby College (Me.); Rutgers College (N. J.); Lowell Institute, Boston; Brooklyn Institute; People's Institute (N. Y.), etc. Teachers College, Columbia University, has also conducted extension classes, and in 1903 Columbia University instituted an extension department, and later took over the administration of all extension courses of the university. In 1913 extension departments had been organized in connection with 43 colleges and universities throughout the country, giving work other than agricultural. Mention should be made of the system of "free lectures to the people" of the New York Board of Education, embodying most of the features of

university extension work. The most ambitious plan of university extension is that of the University of Wisconsin, which aims in time to establish local headquarters throughout the State, since it is a State maintained institution, and to provide work which "includes not only such courses as entitle the student to credit at the university, . . . but also short courses and conferences not leading to a degree, and the promotion of a great variety of interests that merge the people, both young and old, in the intimate relations of their daily life." This with the dissemination of literature bearing on local everyday conditions, lectures, and correspondence courses will be the natural extension of the movement. The whole conception of university extension is being broadened so as to place the universities of the country at the disposal, not of those alone who are able to attend as regular students, but of the public at large.

As a system of instruction, university extension involves the following elements:

Features. The course of lectures must be given by one instructor, usually at weekly or fortnightly intervals. The lectures must be correlated, dealing with a particular epoch of history, or author, or school of literature, or section of a department of science, etc. They must be scholarly, as representing the thought of the universities; they must be popular to attract and hold the auditors. The number of lectures in a course varies with different organizations. The unit adopted by Oxford, by the American Society, and by Chicago is the six-lecture course. Cambridge has a twelve-lecture unit, and Columbia a six-lecture unit for its more popular courses, and a thirty-lecture unit for its academic and professional courses. The lectures are frequently illustrated by stereopticon, or by demonstrations. A recent development of the lecture system has been its application for purposes of entertainment or the provision of desirable recreation for popular audiences. This system, adopting the "Lyceum" method, provides lectures, musical recitals and readings, singly or in courses. By class is meant the group of people of the audience who remain after the lecture for questions, discussion, and suggestions on the subject of the lecture. Individuals, also, may here get personal advice on their work and reading, and criticism of their essays. In England this type of work has been organized under the term "tutorial" classes as distinguished from the lecture courses. The students' association is a club of students and readers desirous of getting the stimulus that working in common affords. The students' association has its own organization, and its regular programme of work, both before and after, as well as during the lecture course. Systematic guidance in every lecture course is provided in a special syllabus, outlining each lecture, selecting the best books on the subject, offering topics for thought, reading and papers, and illustrative notes, and prescribing the work required for certificates. Traveling libraries facilitate student work in places not provided with adequate library facilities. The central organization usually provides a select library of perhaps fifty volumes of books recommended by the lecturer.

Examinations, Centres, etc. At the close of each course of lectures a written examination is given by the lecturer to auditors qualified and willing to take it. The qualification may

be the reading of certain books, the presentation of certain essays during the course, regular attendance, etc. The certificates obtained by successful candidates in these examinations are sometimes valuable in special ways. In England they are credited towards the government requirements for pupil-teachers' standing. In Chicago they count towards the baccalaureate degree of the university. In Columbia the thirty-lecture courses receive the same credit as the corresponding courses within the university. University extension is based on the principle of local initiative. It requires that those who desire to avail themselves of its assistance shall be organized as a centre. By "local centre" is meant a group of people who are willing to adopt extension aims and methods, arranging through a local committee on the one hand and the central organization on the other for systematic courses of extension lectures.

In addition to the above must be mentioned as part of the whole movement of university extension the development of courses by correspondence, many of which count for university credit. The most popular extension courses are those organized in connection with most university extension departments as agencies in the further training of teachers in service. These are arranged at times convenient to the clientele and receive university credit. Hardly less popular are courses and conferences conducted by agricultural departments of colleges and universities for the benefit of farmers.

Consult: Adams, in United States Commissioner of Education, *Reports* (Washington, 1898-1900); A. Mausbridge, *University Tutorial Classes* (London, 1913); L. E. Reber, "University Extension in the United States," in *United States Bureau of Education, Bulletin No. 9* (Washington, 1914).

UNIVERSITY OF CHICAGO. See CHICAGO, UNIVERSITY OF.

UNIVERSITY PLACE. A city in Lancaster Co., Neb., four miles northeast of Lincoln, of which it is a residential suburb, on the Chicago, Rock Island, and Pacific Railroad (Map: Nebraska, H 4). It is the seat of Nebraska Wesleyan University, and of the State Agricultural College, and contains a Carnegie library. Pop., 1900, 1130; 1910, 3200.

UNIVERSITY SETTLEMENTS. See SOCIAL SETTLEMENTS.

UNNA, un'nä. A town in the district of Arnsberg, Prussia, 30 miles south of Münster (Map: Germany, B 3). The town has important iron industries. In the vicinity is the great salt mine of Königsborn. Pop., 1900, 14,918; 1910, 17,355.

UNNA, PAUL GERSON (1850-). A German dermatologist, born in Hamburg. He was severely wounded in the Franco-Prussian War of 1870-71. After studying medicine in Heidelberg, Leipzig, and Strassburg, he settled at Hamburg in 1881 and three years later opened a hospital for skin diseases. Unna's investigations in dermatology were many and important. He introduced into medicine the use of ichthyol and resorcin. Successful also as a teacher and writer, he founded the *Monatsshefte für praktische Dermatologie* (1882) and *Dermatologische Studien* (1886), of which journals he became editor. In 1889 appeared the *Internationaler Atlas seltener Hautkrankheiten* (with others) and in 1894 *Histologischer Atlas zur Pathologie der Haut*.

UNNATURAL COMBAT, THE. A tragedy by Philip Massinger, produced at the Globe in 1619 and printed in 1639.

UNST, UNST. The northernmost of the Shetland Islands (q.v.).

UNTER DEN LINDEN, un'tēr den līn'den. A famous avenue of Berlin, named from the rows of linden trees with which it is planted. It extends from the Brandenburg gate to the palace of Emperor William I, and is extended thence to the Royal Palace by the Platz am Opernhaus, Platz am Zeughaus, and the Lustgarten, a total length of about a mile. The street is 196 feet broad and is flanked by fine shops, the university, arsenal, and several palaces.

UNTERMAYER, un'tēr-mī'ēr, LOUIS (1885-). An American poet and journalist. He was born in New York City, where, after leaving high school, he became identified with his father's jewelry manufacturing business. He joined the editorial staff of *The Masses*, and in the Chicago *Evening Post* conducted a column (half critique, half causerie) under the head "and Other Poems." An ardent propagandist of the new spirit in American poetry, he lectured on this subject at various colleges. Untermeyer is particularly happy in his parodies of the manner of the vers librist and certain other poets. Aside from work of this kind, his verse is known for lyric quality of a high order; in content, much of it is concerned with social and industrial wrongs. His writings include: *The Younger Quire* (1911), a volume of burlesques; *First Love* (1911); *Challenge* (1914); — and *Other Poets* (1916), parodies.

UNTERMYER, SAMUEL (1858-). An American lawyer, born at Lynchburg, Va. His family moving to New York City shortly after the Civil War, he was educated at the College of the City of New York and at the law school of Columbia University, from which he graduated in 1878. Admitted to the bar in 1879, he soon displayed unusual ability and eventually rose to a commanding position at the New York bar. As a member of the firm of Guggenheimer, Untermeyer, and Marshall, he attained large success as a corporation attorney. His talents were well demonstrated in the Asa Bird Gardiner removal case, the Count de Castellane creditor's suit, and the Dodge-Morse controversy. As a Democrat in politics, he supported the antitrust views of the party, seeking to enforce competition and destroy monopolies. He was prominent in 1912 as the attorney of the Pujo Committee (see PUJO, ARSENE), investigating the so-called money trust, and in 1913-14 he aided the Democratic Congress in framing the Clayton Anti-Trust Act (see TRUSTS). Untermeyer became known as a leader of the Jewish race.

UNTERWALDEN, un'tēr-vīl'den. A canton of Switzerland (Map: Switzerland, C 2). It is divided into the two half cantons of Nidwalden (112 square miles) and Obwalden (183 square miles), of which the former forms a part of the Engelberg Valley and slopes towards Lake Lucerne; the latter is more elevated, belonging to the region of the Bernese and the Lucerne Alps. The principal river is the Aa. Stock raising and gardening are the leading industries, and dairy products and fruit are the main exports. The two half cantons have separate governments, and are among the most democratic cantons in Switzerland, the legislative power being exercised directly by the people as-

sembled in the Landsgemeinde. The initiative is in force. The canton sends two members to the National Council. The capital of Obwalden is Sarnen, and of Nidwalden, Stanz. Pop., 1910, Obwalden, 17,118; Nidwalden, 13,796. The inhabitants are mostly German-speaking Catholics.

Unterwalden originally belonged to Aargau and Zürichgau. It came under the rule of the Hapsburgs, took part in the uprising against them, and in 1291 concluded an alliance with Uri and Schwyz, which formed the nucleus of the Swiss Confederation. It took part in the formation of the League of Sarnen (1832) and the Sonderbund (1843).

UN'WIN, WILLIAM CAWTHORNE (1838-). An English engineer, born at Coggeshall, Essex. He was a student under Sir William Fairbairn, and from 1868 to 1872 was instructor at the Royal School of Naval Architecture. In 1872 he was made professor of mechanical and hydraulic engineering at the Royal Indian Engineering College, and in 1884 professor of engineering at the Central Technical College of the Guilds of London. In 1911 he served as president of the Institute of Civil Engineers. His publications include: *Wrought Iron Bridges and Roofs* (1869); *The Elements of Machine Design* (1882; new ed., 2 vols., 1907-08); *The Testing of Materials of Construction* (1888; 3d ed., 1910); *Development of the Experimental Study of Steam Engines* (1895); *The Life of Hirn, Watt Lecture* (1896); *Treatise on Hydraulics* (1907; 2d ed., 1912).

UNYORO, ün-yō'rō, or BUNYORO. A district in British Africa, in the Protectorate of Uganda, of which it forms part of the northern province (Map: Congo, F 2). Estimated area, 32,000 square miles; population unknown. In the south the country is hilly and in the north level and heavily wooded. The inhabitants are the Wanyoro, an agricultural Bantu tribe, whose language has extended to other territories. See UGANDA PROTECTORATE.

UPANISHAD, u-pān'ī-shād (Skt. upanīṣad, a sitting down beside, session, esoteric doctrine). The name of a class of Vedic works devoted to theological and philosophical speculations on the nature of the world and man. (For the relation of the Upanishads to the Aranyakas as well as to the Veda, see BRAHMANISM; VEDA; VEDANTA.) All Hindu speculation presupposes the theory of transmigration of souls. (See METEMPSYCHOSIS.) In the oldest Vedic period the Hindu people took a joyous view of future life. Later, however, they acquired the firm belief in karma (q.v.), which appears first in the Satapatha Brahmana, and has since remained an axiom of Hindu thought. The theory of transmigration is coupled in the Upanishads with the equally important theory of the world soul and its presence in all living or organic beings. (See PANTHEISM.) The human body is supposed to be pervaded by breaths, or atman, which are the individual existence, or ego, and are in turn conceived as flowing from a single atman, the universal ego. All the worlds are merely an emanation of this universal ego. The notion of the atman is further coupled with that of the brahma, "the sacred word, or universal holiness." (See BRAHMA.) These two ideas, in time, are fused so that in the composite atman-brahma we have two manifestations of the final all-power. Here the atman represents, as it were, the physical aspect, while the brahma stands for the spiritual side of universal life and the

ultimate essence. The fundamental doctrine of the Upanishads is the identity of the individual soul (atman) with the world soul (atman-brahma). The formula "that art thou" (*ta tvantasi*) is the keynote of all Upanishad teaching. It is curious how this doctrine is coupled with metempsychosis. Instead of rejoicing in the knowledge of their own divine essence, the Hindus look upon their individual existence as a condition of separation from the divine essence. The wandering of the soul through the realms of death is the consequence of its separation from the brahma, and salvation, the escape from the chain of successive deaths, can be attained only by reunion with the brahma. The Hindus never sought to explain how the individual souls were separated from the all-soul; they took this for granted. Desire, or clinging to life, is the reason why this separation continues. The only cure for desire is knowledge, or, perhaps better, recognition of the unity of the ego with Brahma and the ever-present recognition of the divided condition of everything finite. Thus the ultimate attainment for man is this recognition, which is salvation through the penetrating knowledge of one's own divine nature, which effaces the entire delusion of individual existence.

The date of the Upanishads is quite uncertain, but the earliest of them are hardly later than 600 B.C., since their most important ideas appear in an advanced and somewhat decayed state in the Buddhist writings. The older Upanishads are the products of Vedic schools. The two most important, the *Bṛhadāraṇyaka* and the *Chāndōgya*, belong respectively to the White Yajur Veda and the Sama Veda; the *Āitareya*, *Kāṣītaki*, *Tāittiriya*, *Kāthaka*, and *Maitrāyaṇya* or *Manava* belong to schools of the same names. The *Kēna* and *Talavakāra* Upanishads also belong to the Sama Veda, the *Iśa* to the White Yajur Veda, the *Śvetāśvatara* and the *Mahānārāyaṇa* to the Black Yajur Veda. A large and indefinite number of Upanishads, of which the *Mundaka*, *Praśna*, and *Māṇḍūkya* are the most important, are counted as belonging to the Atharva Veda. The most authoritative list counts 27, but later Upanishads are generally counted as belonging to the Atharvan. A complete list of Upanishads is impossible, because the term does not mean a closed canon, but rather an indefinitely extensible type of literature which may be continued in the present or future. In 1876, 235 Upanishads were enumerated, including apocrypha, one of those actually a Mohammedan treatise called *Alla Upaniṣad*. The later Upanishads may be divided into five classes: (1) Pure Vedānta Upanishads, which combine the Vedānta doctrines of the older texts without undue development of the notions of *Yōga* (concentration and abstraction from all mundane matters) or *Samnyāsa* (asceticism); (2) Yoga Upanishads, which presuppose the Vedānta ideas, and in addition advise mental concentration upon the sacred syllable *ōm* (q.v.); (3) Samnyāsa Upanishads, which recommend and describe a life of asceticism as the practical way of attaining the purpose of the Upanishads; (4) Siva Upanishads, which interpret the popular god Siva (q.v.) as a personification of the atman; (5) Vishnu Upanishads, which interpret Vishnu (q.v.), or one of his avatars (see AVATAR), as divine or human manifestations of the atman. See HINDUISM; INDIA, *Religion*; etc.

Bibliography. Editions of individual Upanishads are extremely numerous in India. A select list is given by A. A. Macdonell, *History of Sanskrit Literature* (London, 1913). A convenient edition of 108 Upanishads was edited by Tukaram Tatya (Bombay, 1895). Among translations the following may be cited: Max Müller, *Sacred Books of the East*, vols. i, xv (2d ed., Oxford, 1900); Deussen, *Sechzig Upanishads des Veda* (Leipzig, 1897); and those of Mead and Chattopādhyāya (2 vols., London, 1896), and of Sastri, Jhā, and Seshacharri (5 vols., Madras, 1898-1901). Consult: Deussen, *Die Philosophie der Upanishads* (ib., 1899; Eng. trans. by Geden, Edinburgh, 1906); Gough, *The Philosophy of the Upanishads* (London, 1882; 3d ed., 1903); Jacob, *Concordance to the Principal Upanishads and Bhagavadgītā* (Bombay, 1891); H. Oldenberg, *Die Lehre der Upanishaden und die Anfänge des Buddhismus* (Göttingen, 1915).

UPAS, ū'pas (Malay *ūpas*, poison), *Antiaris toxicaria*. A tree of Java, the Philippine Islands, and adjacent regions, of the family Moraceæ, to which also belong the breadfruit, mulberry, etc. The fruit is a kind of drupe, covered with fleshy scales. The Malays mix the milky juice of this tree with black pepper and the root juices of galenga and ginger for tipping arrows. The fibre of the bark is some-

UPAS TREE.

times made into cloth, but unless it is thoroughly cleaned garments made of it are said to produce itching. Some botanists believe that the tree whose bark is used for fibre is a distinct species, as other species of this genus are innocuous. The story was once common of a poison vale in Java, in which the exhalations of numerous poison trees destroy all animal life, and even all other vegetable life. The presence of noxious gases in these volcanic valleys is believed to have been responsible for the origin of this legend.

UP'COTT, WILLIAM (1779-1845). A famous English collector of autographs, a natural son of Ozias Humphry, one of the greatest English miniaturists. He was brought up to the book trade; and when Richard Porson (q.v.), the Greek scholar, was appointed librarian in the London Institution Upcott became his assistant (1806). He resigned in 1834, and lived at Islington. At his home, known as Autograph Cottage, he collected over 32,000 letters illustrated by 3000 portraits. After his death these and other valuable manuscripts were sold, and many of them have found their way into the British Museum. Upcott published a *Biblio-*

graphical Account of the Principal Works Relating to English Topography (3 vols., 1818); revised for the press *Evelyn's Diary* (1818); edited Evelyn's *Miscellaneous Writings* (1825); and engaged in much other literary and antiquarian work.

UPERNIVIK, ūp-ēr'nī-vik, or **UPERNAVİK**. The most northern Danish district in Greenland, on Baffin Bay, in which is situated Tasiusak, 73° 22' N., the most northerly civilized settlement of the Western Hemisphere. The town Upernivik, with a mission station, is on a small island just off the coast in latitude 72° 48' N., and longitude 55° 54' W. (Map: Arctic Regions, G 6). The mean temperature here is 5.8° F. in January and 40.5° F. in July.

UPHAM, ūp'am, CHARLES WENTWORTH (1802-75). An American Unitarian clergyman. He was born at St. John, N. B.; graduated at Harvard (1821) and at Harvard Divinity School (1824); and became colleague pastor, with the Rev. John Prince, of the First Unitarian Church, Salem, Mass. There he remained until 1844, when he was compelled by loss of voice to leave the ministry. Subsequently he was mayor of Salem (1852); was several times a member of the State Legislature, being president of the Senate in 1857-58; and in 1853-55 was a member of Congress. He published: *Letters on the Logos* (1828); *Lectures on Witchcraft, Comprising a History of the Salem Delusion, 1692* (1831; enlarged ed., 1867); *Salem Witchcraft and Cotton Mather, a Reply* (1870); and *Lives of Sir Henry Vane* (1835), J. C. Frémont (1856), Francis Peabody (1869), and Timothy Pickering (1867-72). He also edited the *Christian Review* and *Christian Register*.

UPHAM, SAMUEL FOSTER (1834-1904). An American Methodist Episcopal clergyman and theologian, born at Duxbury, Mass. He graduated from Wesleyan University in 1856 and then entered the ministry. In 1865 he was chaplain of the Massachusetts House of Representatives, and from 1881 till his death he was professor of practical theology in Drew Theological Seminary. A speech made by him was largely responsible for the abolition of the time limit in the Methodist ministry. He was secretary of the Commission on the Constitutional Law of the Church from 1896 to 1900. In 1900-04 he was chairman of the committee on the revision of the *Methodist Hymnal*. He served also as president of the Martha's Vineyard Campmeeting Association. He was noted for his wit as well as for his ability as a preacher and leader.

UPHAM, THOMAS COGSWELL (1799-1872). An American Congregational theologian. He was born at Deerfield, N. H., and graduated at Dartmouth College (1818) and at Andover Theological Seminary (1821). He taught Hebrew at Andover (1821-22); was a pastor in Rochester, N. H. (1823-24); and served as professor of philosophy and instructor in Hebrew at Bowdoin College (1825-67). His *Manual of Peace* was one of the first suggestions of international tribunals. He published: *Elements of Intellectual Philosophy* (1827); *Elements of Mental Philosophy* (1831); *Treatise on the Will* (1834); *Outlines of Disordered and Imperfect Mental Action* (1840); *Lives of the French Mystics, Madame Guyon and Fénelon* (1847), and *Madame Catharine Adorna* (1856); *The Life of Faith* (1848); *A Treatise on the Divine Union* (1851); *Christ in the Soul* (1872).

UPHAM, WARREN (1850-). An American.

VOL. XXII.—51

can geologist and librarian, born in Amherst, N. H. He graduated at Dartmouth in 1871, was employed on the Geological Survey of New Hampshire in 1875-78, on the Minnesota Geological Survey in 1879-85, and on the United States Geological Survey in 1885-95. In 1895 he became librarian of the Minnesota Historical Society, St. Paul. He wrote: *The Upper Beaches and Deltas of the Glacial Lake Agassiz* (1887); *The Glacial Lake Agassiz* (1895); *Greenland Icefields and Life in the North Atlantic, with a New Discussion of the Causes of the Ice Age* (1896), with G. F. Wright; *Minnesota in Three Centuries* (1908 et seq.). He compiled *Minnesota Biographies, 1655-1912* (1912), with Mrs. R. B. Dunlap.

UPHUES, ūp'hōōs, GOSWIN (1841-). A German philosophical scholar, born at Brochterbeck. Originally a Catholic theologian, he was suspended by the Church in 1876 for his attitude on the school question, and in the following year became gymnasium professor at Aarau. In 1890 he was appointed professor of philosophy at Halle. The psychology of perception was his special field of investigation. His writings include: *Reform des menschlichen Erkennens* (1874); *Kritik des Erkennens* (1876); *Psychologie des Erkennens* (1893); *Sokrates und Pestalozzi* (1896); *Schule und Leben* (1897); *Religiöse Vorträge* (1903); *Kant und seine Vorgänger* (1906); *Der geschichtliche Sokrates kein Sophist und kein Atheist* (1907); *Geschichte der Philosophie als Erkenntniskritik* (1909).

UPHUES, JOSEPH (1850-1911). A German sculptor, born at Sassenberg, Westphalia. He studied for three years at the Berlin Academy, and became a follower of Begas, whom he afterward assisted in his workshop. Much severer treatment of form, however, than is characteristic of Begas distinguishes his work, as may be seen in his "Sabine Defending his Sister," and the "Bowman" (great gold medal, Melbourne, 1888; Chicago, 1893), in the National Gallery at Sydney. For Düren in Rhenish Prussia he executed a monument to Emperor William I and the Bismarck Monument (1892); for Homburg and Wiesbaden (1896), monuments to Emperor Frederick; and in Berlin he created an entirely novel type of a youthful "Frederick the Great"; and contributed to the monuments in the Siegesallee the statue of Margrave Otto II. Three large sepulchral monuments of his design at Düren exhibit deep religious feeling and noble conception.

UPJOHN, RICHARD (1802-78). An American architect, born in Shaftesbury, England. He emigrated to the United States in 1829, and in 1839 he settled in New York, where his best work was done. His principal works include: St. John's Church, Bangor, Me. (burned 1911); the Chapel of Bowdoin College; Christ Church and the Church of the Pilgrims, Brooklyn; Trinity Church and St. Thomas's (burned 1905) in New York; the Corn Exchange Bank, New York; and numerous private residences. From 1857 to 1876 he was president of the American Institute of Architects.

UPJOHN, RICHARD MICHELL (1828-1903). An American architect, son of Richard Upjohn. He designed the Central Church in Boston, with an exceptionally fine tower; the Park Congregational Church and the State Capitol at Hartford, Conn.; St. Paul's in Brooklyn; St. John's (American) Church at Dresden, Germany; and other churches in various cities.

UPLAND PLOVER. A sportsman's name for the large sandpiper (*Bartramia longicauda*) common throughout the United States, and frequenting uplands and plains more than is customary with other species of its kind. See SANDPIPER.

UPMARK, up'märk, GUSTAF HENRIK VILHELM (1844-1900). A Swedish art historian, born in Stockholm. After studying at Upsala (1861-69), he secured a position in the National Museum in Stockholm and was its director from 1880 to his death. He was the founder and chairman of the Gripsholms Society which, in 1889-95, restored the long-neglected ancient castle of the Vasa dynasty. Upmark's more important publications include: *De grafiska konsterna* (1889); *Svenska Riddarhuset, byggnadshistoria* (1890); *Architektur der Renaissance in Schweden 1530-1760* (Berlin, 1897-99); besides many essays concerning art in Sweden under the Vasa dynasty, such as *Tapetväfveriet i Sverige under de första Vasakonungarna* (1886), *Gripsholms slott* (1887), *Vadstena slott* (1891), *Skånska herrgårdar under renässanstiden* (1894), *Stockholms slott under Vasatiden* (1896).

UPOLU, ū-pō'loo. The second largest and politically the most important island of Samoa (Map: Samoan Islands, C 5). Length, 39½ miles, average breadth from north to south, 8 miles; area with outlying islands, about 345 square miles. On the north shore there are harbors at Apia, Saluafata, and Fagaloa (of which Apia alone is a port of entry), all well protected against the southeast tradewind, but exposed to the frequent and heavy northerly gales in the rainy season. The backbone of the island is a fairly single mountain chain about 2500 feet in height. Plantations lie on the narrow coastal plain and gentle slopes of the central and western regions of the north shore. Apia, the seat of administration, is a small town lying along the beach but singularly healthful; the residence of the governor lies several miles inland at Vailima in the hills. Pop., 1910, 20,662, including with Upolu the islands of Manono and Apolima. See SAMOAN ISLANDS.

UPPER AMMONOOSUC. See AMMONOOSUC.

UPPER AUSTRIA, or AUSTRIA ABOVE THE ENNS. An archduchy and crownland, occupying the western part of the original Archduchy of Austria—the nucleus of the Austrian Empire (Map: Austria, D 2). Area, 4628 square miles.

Almost all the archduchy is either mountainous or rolling. The Danube divides the land into two very unequal parts. The northern and smaller is a prolongation of the Bohemian forests (the Böhmer Wald), while the southern belongs to the Alps (Kalkalpen) system, where high peaks, with glaciers on their slopes, lift their heads. The highest point in the archduchy is approximately 10,000 feet—the Dachstein, on the extreme southern border. In the mountainous southwestern portion is the famous Salzkammergut (q.v.), from which the Traun valley descends southeasterly to below Linz, through the heart of the archduchy. In the western portion is the Hausruck region, which produces lignite in abundance. The Enns, an affluent of the Danube, entering near the southeast corner of the archduchy, marks the eastern boundary. The Kammersee and Traunsee are the largest of its lakes. There are about 30 mineral springs, the best known being the saline waters at Ischl and the iodine waters at Hall. The climate

yields an ample rainfall while the temperature depends on the altitude.

The crownland is highly productive. Considerably over one-third of the total area is tilled, over one-third is in forests, and nearly one-fifth meadows and pasture. Rye, barley, oats, wheat, vegetables, and fruit are the most prominent products. Cattle raising and horse raising are very important industries. Brown coal and salt are extensively mined, and there are valuable quarries of gypsum and stone. The salt industry is a government monopoly and about 30 per cent of the product of the Empire is supplied by Upper Austria. The crownland manufactures metal wares—weapons, knives, etc.—machinery, linens, cottons, paper, and cellulose.

The Landtag has 69 members, including the Bishop of Linz and representatives of large landed estates, cities, rural districts, and the chambers of industry and commerce in the capital, Linz, the leading town. To the Lower House of Austria the crownland sends 22 delegates, all German. Pop., 1900, 810,246; 1910, 853,006. Of the total in 1910, 97.31 per cent were Roman Catholic, 2.48 per cent Evangelical, and 0.14 per cent Jewish. German was the vernacular of 99.7 per cent.

UPPER COQUILLE, kō-kēl'. An ATHAPASCAN TRIBE.

UPPER SANDUSKY. A village and the county seat of Wyandot Co., Ohio, 64 miles north by west of Columbus; on the Sandusky River, and on the Pennsylvania and Hocking Valley railroads (Map: Ohio, D 4). It has an old mission church, a handsome court house, a Carnegie library, and a park. Upper Sandusky is engaged chiefly in manufacturing, the most important products being agricultural implements, hay presses, buggies, and other vehicles, caskets and burial cases, steam pumps, tools, cereal food, flour, brick and tile, and gasoline tractors. Pop., 1900, 3355; 1910, 3779.

UPPER SENEGAL AND NIGER. One of the colonies which constitute the Government-General of French West Africa. It extends approximately between 10° and 20° N. lat., bounded by Mauritania and Senegal on the west and the Military Territory of the Niger on the east. Its northern limits extend to the Algerian Sahara, and on the south it touches French Guinea, the Ivory Coast, the Gold Coast, Togo, and Dahomey (Map: Africa, D, E 3). The *Annuaire du gouvernement général de l'Afrique occidentale française* published in 1914 states that the area is about 2,500,000 square kilometers (sq. km. = 0.3861 sq. m.). This includes the Saharan regions occupied by nomads. The area having a sedentary population, which extends northward to about the seventeenth parallel, does not exceed 1,000,000 square kilometers. The country embraces the basins of the upper Senegal, the middle Niger, and the upper Volta. In general the surface is flat or rolling; the highest mountains, in the southwest, reach an altitude of 600 to 700 meters. A vast plateau of ferruginous laterite extends to about the fourteenth parallel, where it gives way to sandy plains which finally merge into true desert. The natives practice both agriculture and grazing. The principal crops include rice, corn, peanuts, millet, manioc, and tobacco. Some cotton is produced, and the natives manufacture cotton cloth. Large numbers of cattle, camels, horses, donkeys, and ostriches are raised. The forests yield rubber,

gums, and valuable timber. Imports and exports by way of Senegal were valued at 9,803,799 and 3,422,410 francs in 1912. The principal exports in 1912 were peanuts, rubber, hard gums, and corozo nuts. In addition, there is a considerable trade by way of French Guinea, the Ivory Coast, the Sahara, etc. From the middle of June to the middle of November there is steamer communication on the Senegal River between Kayes and St. Louis on the coast. A railway extends from Kayes to Konlikoro, 553 kilometers; it reaches the Niger at Bamako, kilometer 496. The line has been in operation since 1904. At kilometer 10 there is a branch of 2 kilometers to Médine. Westerly from Kayes a railway extends to Ambidedi, 44 kilometers.

The native population is estimated at somewhat over 5,600,000, of whom about 5,598,000 are French subjects. The white inhabitants number about 1100, almost entirely French. Of the natives who are French subjects, the number of Mohammedans is stated at about 1,405,000, and of fetishists at about 4,191,000; there are a few Roman Catholic natives, probably less than 2000. The capital is Bamako, the population of which is about 7050; other important towns are Ouagadougou, 19,332; Kayes, 8952; Ségou, 8405; Sikasso, 7408; Timbuctoo, 6809. The colony is administered by a Lieutenant-Governor, under the Governor-General of French West Africa.

UPPER TUNGUSKA, tun-goo'ská. See ANGARA.

UPSALA, up-sä'lá. The capital of the Län of Upsala, Sweden, on both banks of the navigable Fyriså, in a fertile and historic plain, 41 miles by rail north-northwest of Stockholm (Map: Sweden, F 7). The ancient city is best known now for its university. (See **UPSALA, UNIVERSITY OF**.) The new town lies on a level on the left bank of the river; the old portion ascends the hills on the west shore. The fine French-Gothic cathedral dates from 1258 and was completely restored between 1870 and 1893. The interior contains the splendid burial chapel of Gustavus Vasa. The cathedral also contains a monument to the botanist Linnaeus, who lived in Upsala.

Among the university buildings in the vicinity of the cathedral are the ancient Gustavianum, the Carolina Rediviva (1841), and the handsome new Renaissance structure completed in 1886. The valuable university library is celebrated for the Codex Argenteus of Ulfilas (q.v.). The botanic garden is very fine. The half-finished historic castle—the Slott—on the hill to the south of the town was built by Gustavus Vasa in 1548 and is now used for the provincial archives. Southeast and stretching along the Fyriså is the Strömparterre—a pleasure park called by the students the "hole of a beehive." South of the city is the noteworthy Ultuna Agricultural Institute. Several miles farther south is the splendid château of Skokloster. Its origin is due to Marshal Wrangel, who housed here his rich collections accumulated in Germany in the Thirty Years' War. Northeast of Upsala lies the notable village of Gamla Upsala, the capital of the ancient pagan kings, who worshipped here in a celebrated temple. Adjacent are tumuli (about 60 feet high) which were connected with the pagan rites. In the vicinity is the *Tingshöj*—a hill (32 feet high) from which the ancient rulers spoke to the people. The name Upsala (OSwed. *Uppsälir*, the high

halls) dates from 1273, when the Archbishop took residence there.

Upsala has an excellent school system, comprising both normal and high schools, a fine hospital, an insane asylum, a royal society of science, a medical association, and an organization for the study of the humanities. The Museum of Northern Antiquities is in the garden of Linnaeus. Upsala was formerly an important commercial centre, but now the town owes its prosperity mainly to the university. Pop., 1900, 22,855; 1910, 25,960.

UPSALA, UNIVERSITY OF. An institution of learning situated at Upsala, Sweden. In 1477 Pope Sixtus IV gave permission to establish a Studium Generale at Upsala after the model of Bologna and lectures were begun the same year. In 1566 Eric XIV established a chair of Greek. King John III established four new professorships, but as the professors refused to assent to the King's Catholicizing acts, the university was closed. It was not until 1593, when the Reformation again gained a strong foothold in Sweden, that the university was reestablished, with two faculties, theological and philosophical. Gustavus Adolphus endowed the university munificently, thus assuring its material independence. The Gustavianum, one of the oldest buildings, dating from the reign of this monarch, is still extant. The university consisted of the faculties of theology, law, medicine, and philosophy. The attendance in 1913 was 2419. The library, which was enriched considerably by the collections of Gustavus Adolphus, contains over 400,000 volumes and 22,000 pamphlets. Consult C. Annerstedt, *Upsala Universitets Historia* (Upsala, 1877-1914), and C. F. Thwing, *Universities of the World* (New York, 1911).

UPSHUR, ùp'shër, ABEL PARKER (1790-1844). An American statesman, born in Northampton Co., Va. He studied law under William Wirt (q.v.), and was in 1810 admitted to the bar. In 1824 he was elected to the State Legislature, in 1826 was appointed a judge of the Virginia General Court, and in 1829 was made a member of the convention for the revision of the State constitution. President Tyler appointed him Secretary of the Navy in 1841, and in 1843 he was transferred to the post of Secretary of State, left vacant by the resignation of Daniel Webster. He was an extreme supporter of States' rights and slavery. His death was caused by the bursting of a gun on board U.S.S. *Princeton*. He published an *Inquiry into the Nature and Character of our Federal Government* (1840).

UPSON, ANSON JUDD (1823-1902). An American clergyman and educator, born in Philadelphia. He graduated at Hamilton College in 1843. In 1849 he was appointed professor of rhetoric and moral philosophy at Hamilton, and from 1853 to 1870 was professor of logic and rhetoric there. He then became pastor of the Second Presbyterian Church in Albany. He was appointed professor of sacred rhetoric and pastoral theology at Auburn Seminary in 1880, and in 1887 became professor emeritus. In 1890 he was made chancellor of the University of the State of New York.

UPTON, EMORY (1839-81). An American soldier, born at Batavia, N. Y. He graduated at West Point in 1861; served as aid-de-camp on the staff of General Tyler, and while so doing was wounded in the battle of Bull Run; fought in the Peninsular campaign and in the Maryland

campaign; and was commissioned colonel of the One Hundred Twenty-first New York Volunteers on Oct. 23, 1862. He was engaged in the battle of Fredericksburg; commanded a brigade of the Sixth Corps at Gettysburg, Rappahannock Station, and Mine Run, and in the Wilderness campaign and part of the Richmond campaign. At Spottsylvania in May, 1864, he was wounded while leading the assaulting column of 12 regiments of the Sixth Corps, and as a reward for his gallantry was brevetted lieutenant colonel of the Twenty-fifth Infantry from 1866. He was wounded at Opequan in the Shenandoah campaign, and for gallant conduct at Winchester was brevetted major general of volunteers. He later commanded the Fourth Cavalry Division in Gen. J. H. Wilson's operations in Georgia, and for his services in the assault on Selma was brevetted brigadier general in the regular army. After the war he served as lieutenant colonel of the Twenty-fifth Infantry from 1868 until 1880, when he became colonel of the Fourth Artillery. He was also engaged in preparing a system of tactics for the service, and from 1870 until 1875 was commandant of cadets at the Military Academy at West Point. Not long after his promotion to the rank of colonel his mind became affected and he committed suicide. His published works include: *A New System of Infantry Tactics* (1867; 2d ed., 1874); *Tactics for Non-Military Bodies* (1870); and *The Armies of Asia and Europe* (1878). Consult Michie, *Life and Letters of Major-General Emory Upton* (New York, 1885).

UPTON, GEORGE PUTNAM (1835-1919). An American musical critic, born in Boston, and educated at Brown University. From 1863 to 1881 he was on the editorial staff of the *Chicago Tribune*. In 1872 he founded and became first president of the Apollo Club. His works include: *Woman in Music* (1885); *Standard Operas* (1886; 15th ed., 1912); *Standard Oratorios* (1887); *Standard Symphonies* (1892); *Johann Sebastian Bach* (2 vols. in 1, Chicago, 1905); *Standard Concert Repertory* (1909). He also translated Nohl's biographies of Haydn, Beethoven, Wagner, and Liszt.

UR, ʾr (Heb. 'ur, Bab. Uru). An ancient city in southern Babylonia, which has been identified with the modern Mukayyar. The site lies close to the Euphrates, at the point where the canal Shatt el Hai connects this river with the Tigris, while the Wadi Rummeh gives it access to Arabia. Hence, it was in a favorable position for the development of commerce and political greatness. It was the chief seat in Babylonia of the worship of the moon god Nannar or Sin, whose massive temple still stands 70 feet above the plain. The city was held by Eannatum of Lagash, Lugalkigubnidudu and Lugalzaggisi of Erech, and it became the capital of the Kingdom of Sumer and Akkad, founded by Ur Eugur c.2574 B.C. Dungi, Bursin, Gimilsin, and Ibesin reigned there. From this period we have a number of important inscriptions. In the reign of Hammurapi (2124-2081 B.C.) of Babylon, Ur was conquered by the Amoritic dynasty. It remained important as a sacred place. In the Assyrian period it was ruled by a governor. Bilsharusur, the son of Nabunaid, was Governor of Ur. The population of the city was originally Sumerian. An admixture of Akkadians must be assumed for the period of Ur Eugur and his successors. Later it is probable that Chaldeans (q.v.) settled in Ur. The biblical passages call

it Ur of the Chaldees, and make it the starting point of the migration of Abraham's family westward (Gen. xi. 27-32). The first examination of the ruins in modern times was by Pietro della Valle in 1625, who brought home a number of cuneiform inscriptions from Mukayyar. In 1854 and 1855 J. E. Taylor examined the ruins, described the remains, identified the temple of the moon god, and sent to London a number of important inscriptions. Consult: J. E. Taylor, in *Journal of the Royal Asiatic Society*, vol. xv (London, 1855); Loftus, *Travels and Researches in Chaldea* (ib., 1857); H. V. Hilprecht, *Explorations in Bible Lands* (Philadelphia, 1903); R. Zehnpunder, *Babylonien in seinen wichtigsten Ruinenstätten* (Leipzig, 1910); L. W. King, *A History of Sumer and Akkad* (New York, 1910). See BABYLONIA, *History*.

URABÁ, ʾr-rá-bá', GULF OF. The former name for the Gulf of Darien and now applied to the southern portion. See DARIEN.

URÆMIA, ú-ré-mi-á (Neo-Lat., from Gk. *úrōn*, *urōn*, urine + *álmā*, *háima*, blood). The term applied to a characteristic group of symptoms arising from the retention in the circulation of systemic poisons which normally are excreted by the kidneys. (See BRIGHT'S DISEASE.) The symptoms of uræmia are manifested principally in the cerebrospinal nervous system and consist of headache, nausea, vertigo, diminished vision and drowsiness, followed, in severe cases, by convulsions and coma. The urine is scanty, contains casts, and is deficient in urea. Uræmia is a very fatal complication of nephritis. Treatment is addressed to relieving the kidneys of their burden by stimulating the eliminative action of the bowels and skin. Elaterium and the saline purges, hot baths and packs are useful. The kidneys may be stimulated to greater activity by cupping over the loins, and the administration of hot enemas and diuretic drugs. A milk diet is indicated.

URAGA, ʾur-rá'gá. A village in the Province of Sagami, Japan, 15 miles south-southeast of Yokohama. It lies in two divisions on both sides of a narrow harbor. There are two large dry docks. The views in the vicinity are beautiful. Commodore Perry's fleet dropped anchor here on July 8, 1853, and at Kurihama, near by, on July 14, he met the representatives of the Shogun and delivered President Fillmore's letter. This was the first of the series of events which resulted in the opening again of Japan to foreign intercourse. In 1900 a plot of land was purchased at Kurihama and named Perry's Park, and a monument in his honor was unveiled July 14, 1901. Pop., about 1600.

URAL, ʾr'al, Russ. pron. ú-rál'y'. A river of east Russia, partly on the boundary between Europe and Asia (Map: Russia, J 4). It rises in the southern Ural Mountains in the Government of Orenburg, and flows first south through one of the eastern longitudinal valleys, then westward around the southern spurs of the mountain system, and finally southward, emptying into the northern extremity of the Caspian Sea after a course of about 1400 miles. The rainfall over its widely extended basin is but slight, so that the river receives no important tributaries and is unnavigable. The chief towns on its banks are Orsk, Orenburg, Uralsk, and Guriev, the last named at its mouth.

URAL-ALTAIC. The term commonly employed by anthropologists to designate a branch of the yellow or Asian race, which includes the

following groups: Tungusic (Tunguses, Manchus, etc.), Mongolic (Mongols, Kalmucks, etc.), Tataric (Turks, Tatars, part of the Cossacks, Kirghizes, etc.), Finnic (Samoyeds, Finns, Lapps, Magyars, etc.), Arctic (Tchukchis, Koriaks, Kamchatkans, Giliaks, Ainus), and Japanese-Korean. The civilized and more or less Aryanized Finns and Magyars of Europe, the latter intruding Osmanli Turks of Asia Minor, southwestern Europe, and northern Africa, the civilized Turko-Tatar states, ancient and modern, of Turkestan and adjacent parts of central Asia, the Mongol conquerors of China and India, the Asiatic elements of Korean-Japanese culture, etc., represent the capacities, independent and stimulated by contact with other races and peoples, of the Ural-Altaic tribes. While the location of the earliest home of the Ural-Altaic peoples is still indeterminate with exactness—it was somewhere between the Ural and the Altai—certain centres of dispersion of its subdivisions can be noted: Mongolia south of the Altai, Turkestan north of the Pamir, the Uralian country, the Baikal region, the Amur valley, etc. The variety of the response of the Ural-Altaic peoples to foreign culture is seen in their religions. The uncivilized tribes are mostly devotees of Shamanism, as of old, but the Mongols, Manchus, Buriats, Kirghiz-Kalmuck Tatars, and to some extent Koreans and Japanese are Buddhist, the Bashkirs, Turks, etc., are Mohammedans, the greater part of the Kamchatkans, Tchuvashes, part of the Yakuts and of some other Siberian tribes, are Christians of the Russian (Greek) church, the Magyars are about three-fifths Catholic and two-fifths Protestant, and the Finns for the most part Lutheran. Consult: Castrén, *Ethnologische Vorlesungen über die altaischen Völker* (St. Petersburg, 1857); Schott, *Altaische Studien* (Berlin, 1860-72); Mistelli, *Der altaische Sprachtypus* (Basel, 1883); A. H. Keane, *Man, Past and Present* (London, 1900). See URAL-ALTAIC LANGUAGES.

URAL-ALTAIC LANGUAGES (Ural and Altai mountains); also called FINNO-TATARIC, SCYTHIAN, or TURANIAN. A vast group of languages spoken over a territory extending from Okhotsk in the east to Finland, Hungary, and Turkey in the west, and from the Mediterranean to the Arctic Ocean. This group is subdivided into a number of branches, all more or less distantly related, of which the main characteristics are agglutinative terminations that may be appended to an unchangeable root, and possessive pronouns that may be affixed to the noun. A law peculiar to this group of languages is that known as vowel harmony, a species of umlaut (q.v.), or progressive vowel assimilation, by which the vowel of the changeable suffix is adapted more or less accurately to the vowel of the stem, or root. Thus, in Turkish, *yaz*, write, is in the infinitive *yazmak*, to write; while *sev*, love, is *sevmek*, to love. The main branches of the Ural-Altaic group of languages are the following: (a) The Finno-Ugric, also known as the Finnic or Ugrian, comprising (1) the Finnic, whose main subdivisions are the Finnish (q.v.), the Tchadic about Lake Onega, the Karelian (see KARELIANS) from the White Sea to Lake Ladoga, the Livonian (now almost extinct; see LIVONIA) and the Crevinian in Courland (q.v.), the Esthonian (see ESTHONIA) to the south of the Gulf of Finland, and the Lapponic of Lapland (q.v.); (2) the Permian spoken about the Ural Mountains in the northeastern

part of European Russia; (3) the Volga-Finnic or Bulgaric, comprising the Tcheremissian spoken between Nizhni Novgorod (q.v.) and Kazan (q.v.), and Mordvinian on the Middle Volga; (4) the Ugric comprising the Vogul about the Obi River, and the Magyar or Hungarian (q.v.) spoken in central and western Hungary and in Transylvania. (b) The Samoyedic (see SAMOYEDS) branch consisting of a number of dialects along the White Sea and the Arctic shore of Siberia. (c) The Tunguse including the dialects spoken by the Tunguses between the Yenisei River and the Sea of Okhotsk in Siberia and by the Manchus (q.v.) of Manchuria. (d) The Mongolian branch consisting of Mongolian proper in the north of China (see MONGOLIA, *Language*), the Buriat dialects (see BURIATS) on the shore of Lake Baikal, and the Kalmuck (see KALMUCKS) or western Mongolia extending as far west as the Caspian Sea. (e) The Turko-Tataric branch comprising the Yakut spoken on the banks of the Lena River in Siberia, the Kirghiz (q.v.) from Turkestan to the north of the Caspian, and Lake Balkash, the Nogair of the Russian Cossacks in Crimea, the Uiguric and Turkoman (q.v.) in Turkestan, and Turkish (q.v.).

U'RALITE. A variety of amphibole derived from pyroxene. Its crystals, when distinct, show the form of the original mineral, but have the cleavage of amphibole. The crystals vary in color from pale to deep green, and are found at various localities, as in the Ural Mountains and at Canaan, Conn.

URAL (ŭ'ral, Russ. pron. ŭ-räl'y') **MOUNTAINS.** A mountain range in Russia, forming part of the conventional boundary between Europe and Asia. It extends in a general north and south direction approximately along the sixtieth meridian of east longitude from the Kara Sea to the north bank of the Ural River (Map: Russia, K 1). A northwestern extension reappears in the Arctic seas to form the main range of the islands of Waigatz and Nova Zembla, while a southern extension, known as

the Mugodzhär Mountains, runs south of the Ural River nearly to the shores of the Sea of Aral. The Ural Mountains do not form a single range, but constitute rather a broad plateau 45 miles wide in the north and nearly 200 miles wide in the south. This plateau is broken up partly into a number of separate ridges or chains running in various directions, partly into broad dome-shaped masses, though the southern portion divides itself into several parallel north and south branches. The slope is gradual and on the road from Perm to the east it is scarcely perceptible, the steepest gradient on the Trans-Siberian being only 1 in 100. The average elevation of the main crests is not great, scarcely more than 1500 feet. Mount Tel-pos is 5433 feet above the sea and many peaks rise above 5000 feet. The climate is rather severe, with very cold winters and hot summers. The rainfall is greater on the western slope and in the central and northern portion than in the east and south. In spite of the northern location the Urals have no glaciers as the snowfall is slight. The range is a watershed of the Obi in the east, the Ural in the south, and the Volga and Petchora on the west. The vegetation in the southern portion consists mainly of steppes with isolated oases of trees. The central portion is covered with immense forests of spruce, larch, and fir, which in the north give place to dwarf birch and mossy tundras. Geologically, the range consists of a central longitudinal zone of metamorphic slates, granites, gneisses, and syenites, flanked on either side by sedimentary strata, which are chiefly Carboniferous and Permian in the western, and Cretaceous and Jurassic in the eastern zone. In the southeast there are large Devonian outcrops and intrusions of quartz and porphyry. The Ural Mountains are extremely rich in minerals, which are chiefly confined to the central division, between the 55th and 60th parallels, the northern parts being barren. There are rich deposits of iron ore—magnetite, limonite, and red hematite. Over 800,000 tons of pig iron were produced in 1912, the vast forests yielding an inexhaustible supply of fuel. Gold is mined both from veins and placers, and other rare metals, platinum, iridium, and osmium, are comparatively abundant. The Urals yield 90 per cent (5774 kilograms in 1911) of all the platinum produced in the world. Precious stones are also mined, as well as copper, silver, mercury, cobalt, nickel, and zinc. Coal beds exist on the west slope, and yielded in 1912 850,000 tons. Asbestos is one of the distinctive mineral products of the mountains. This mineral wealth has given rise to important industries, and a large number of populous towns have sprung up among the mountains, while a considerable agricultural population has also been attracted.

Consult: Ludwig, *Ueberblick der geologischen Beobachtungen* (Leipzig, 1862); Hochstetter, *Ueber den Ural im Ural* (Berlin, 1873); Hieckisch, *Das System des Urals* (Dorpat, 1882).

URALSK, ū-räl'y'sk. A province of Russia, lying mostly east of the Ural River, the boundary line between Europe and Asia (Map: Asia, G 4). Area, over 139,168 square miles. The surface generally presents a series of dry steppes and deserts sloping gradually to the Caspian. Part of the interior lies below the level of the Caspian. There are many salt lakes, and only the Ural (q.v.) and the Emba (during a part of the year) reach the Caspian, the other streams being lost in the lakes or in the sand.

Uralsk is scantily watered. The climate is continental, the influence of the Caspian Sea being confined to the coast region. The temperature is subject to wide fluctuations, and the precipitation is slight. In the winter the snowstorms are very destructive. Uralsk contains little cultivable land, and agriculture is of secondary importance, the chief occupations being stock raising and fishing. The fisheries along the Ural and the coast of the Caspian Sea are among the most extensive and the best regulated in Russia. The value of the fish, caviar, fish oil, and other fish products exported exceeds \$1,500,000. Pop., 1913, 849,800, two-thirds being Kirghizes. Capital, Uralsk.

URALSK. The capital of the Province of Uralsk, in southeast Russia, at the confluence of the Ural with the Tchagan, 980 miles southeast of Moscow (Map: Russia, H 4). It is a well laid out town with an industrial school for Kirghizes and a natural history museum. It is the commercial centre of the province. Pop., 1911, 45,605.

URAN, ū-ran. Indian linguistic stock of Bolivia and Peru once disseminated over the region from the shores of Lake Titicaca to Lake Poopo (or Aullagas) and the island of Panza, along the whole course of the Río Desaguadero. Consult J. T. Polo, in *Boletín de la Sociedad Geográfica de Lima*, vol. x (Lima, 1901), and A. F. Chamberlain, in *American Anthropologist*, new series, vol. xii (Lancaster, Pa., 1910).

URANIA (Lat., from Gk. *Οὐρανία*, *Ourania*, the Heavenly One, from *οὐρανός*, *ouranos*, heaven, sky). One of the Muses (q.v.). In the later division of functions among the Muses she became the guardian of Astronomy, or rather of the astronomical epic, such as was written by Aratus. She seems to be indicated in the groups of Muses by the globe.

URANIN. See COAL-TAR COLORS.

URANINITE. A mineral uranium oxide usually found in the form of botryoidal or compact masses and often containing such impurities as silica and the oxides of iron, lead, calcium, and magnesium. It is opaque, grayish, greenish, or brownish-black in color, its resemblance to pitch giving rise to the common term pitchblende, which is frequently applied to it. Uraninite has a submetallic lustre, and a conchoidal fracture. It occurs often with ores of silver and lead, in Bohemia, Saxony, Hungary, Turkey, etc. Uraninite, together with its decomposition products gummite and uranophane are important sources of the radium salts. See also RADIUM; POLONIUM; RADIOACTIVITY.

URANIUM (Neo-Lat., named after the planet Uranus). A metallic element discovered by Klaproth in 1789 and first isolated in the metallic state by Péligot in 1840. It is found chiefly as an oxide in the mineral uraninite or pitchblende, which occurs at various localities in Norway, Saxony, Cornwall, and the United States, and also in various other minerals, but in smaller quantities. An important source of uranium compounds in recent years is the uranochre from Cornwall, England. The metal itself may be obtained by reducing uranoso-uranic oxide (see below) with pure carbon or with powdered metallic aluminium, or by electrolyzing the fused double chloride of uranium and sodium.

Uranium (symbol, U; atomic weight, 238.5) is a hard, silvery-white metal with a specific gravity of 18.68. It melts at a bright-red heat.

It combines with oxygen to form a dioxide and a trioxide, which unite with bases to form uranous and uranic salts. Besides the dioxide (UO_2) and the trioxide (UO_3), it forms three other well-defined oxides: viz., the uranosouranic oxide (U_2O_5) already mentioned, a pentoxide (U_2O_5), and a peroxide (UO_4). Perhaps the most important of the uranium salts is sodium uranate, known as uranium yellow, used for painting on glass and porcelain, as well as in making the fluorescent yellow uranium glass. The uranosouranic oxide is used sometimes to produce a black glaze on porcelain.

Uranium and its compounds are radioactive, the element undergoing slow disintegration with formation of a new and distinct element (likewise radioactive) known as uranium X, having an atomic weight probably of 230.5, and behaving chemically like the element thorium. See RADIOACTIVITY.

URANIUM RAYS. See RADIOACTIVITY.

URANOLITE. See METEORITE.

URANOPLASTY. See PALATE.

URANUS (Lat., from Gk. *Οὐρανός*, *Ouranos*, heavens, sky). In Greek theogony, the husband of Gæa, the Earth, and, according to Hesiod, father of the Titans, Cyclopes, and Hecatoncheires. Legend represented him as dethroned and mutilated by his son Cronos. (See SATURN.) From his blood, which fell upon the earth, sprang the Gigantes (see GIANTS), while the part which fell into the sea was washed about until from the foam which gathered rose Aphrodite. Uranus was never an object of worship, but rather, like Cronos, a conception formed from the cult of Zeus for the purpose of a constructive theogony. Among the Romans Cælus appears in myth as a translation of the Greek name, but not as a deity of the Roman religion.

URANUS. The next to the outermost member of the solar system. Its mean distance from the sun is 1,782,000,000 miles; sidereal period, 84 years; eccentricity not quite $\frac{1}{10}$, or about the same as that of Jupiter; inclination to the ecliptic, 46° . It is about 66 times greater than the earth in volume and 15 times in mass, and its density and surface gravity respectively are 0.22 and 0.9. In the telescope the planet appears as a greenish disk of about $4''$ diameter. The greenish tinge is explained as due to some unidentified substance in the planet's atmosphere. Because of its immense distance, astronomers have been unable to gain much information concerning it. Spots and belts have been seen, but they are too faint to warrant any positive assertion, and the time of rotation of the planet is not known with certainty, though it is probably about 10 hours. Uranus was accidentally discovered by Sir William Herschel on March 13, 1781, and was named the Georgium Sidus and Herschel, but these names soon fell into disuse and the name of Uranus, suggested by Bode, finally prevailed. Herschel announced the discovery as that of a comet, and its planetary nature was not demonstrated until three or four months later by Lexell, of St. Petersburg. Before its detection by Herschel, Uranus had been recorded no less than 20 times as a fixed star, 12 times by Lemonnier alone. These observations when compared with more recent ones showed that the planet was wandering from its track. The attempts made to account for these irregularities led to the discovery of Neptune (q.v.).

Uranus has four satellites:

NAME	Distance from planet in miles	Sidereal period
Ariel.....	120,000	2d 12h 29m
Umbriel.....	170,000	4d 3h 27m
Titania.....	280,000	8d 16h 57m
Oberon.....	375,000	13d 11h 7m

Oberon and Titania were discovered by the elder Herschel, Jan. 11, 1787; the other two were discovered by Lassell, Oct. 24, 1851. They are estimated to vary in size from 200 to 500 miles in diameter. The plane of their orbits is inclined at 98° to the plane of the ecliptic, and the direction of their motion, like that of Phœbe, the ninth satellite of Saturn, the eighth and ninth satellites of Jupiter, and the satellite of Neptune, is from east to west. See ASTRONOMY; PLANETS; SOLAR SYSTEM.

URARI. See CURARI.

URASHIMA TARO, *ūr'ā-shē'mā tār'ō*. In Japanese legend, the story of a fisher boy who was taken down on the back of a tortoise into the palace of *Ryu-gū*, or the realm of the dragon king of the world under the sea, and there in blissful dalliance knew nothing of the flight of time. Returning to the earth for a brief visit to his parents, he finds all strange in his native village, enters the old cemetery, and, against the express orders of the sea king's daughter, opens the casket she has given him, only to find himself an old man soon to die. This is a favorite theme with native artists. The legend is one of the oldest in the language, and is first found in writing in the *Manyōshū* (Collection of a Myriad Leaves of Poetry) of the seventh and eighth centuries. The official annals give 477 and 825 A.D. as the dates of his disappearance and return. The myth of Urashima is the Japanese version of the Oriental legend of the Seven Sleepers, represented in America by the story of Rip Van Winkle, and also found in Celtic mythology.

URATYUBE, *ūr'ā-tyōō'be*. A town in the Territory of Samarkand, Russian Turkestan, 55 miles southwest of Khodjend (Map: Asia, Central, N 3). It is surrounded by a wall and has a Russian quarter. The chief articles of trade are horses and camel-wool cloth. Pop., about 22,000, chiefly Uzbeks. Uratyube was founded, according to local tradition, by Cyrus. It was taken by the Russians in 1866.

URBAIN, *ūr'bān'*, GEORGES (1872-). A French chemist, born in Paris. He obtained the degree of D.Sc. from the Faculty of Sciences, Paris, in 1899, and later became professor of chemistry at the Sorbonne. His writings include: *Recherches sur la séparation des terres rares* (1899), and *Introduction à l'étude de la spectrochimie* (1911).

URBAN. The name of eight popes.—**URBAN I**, SAINT, POPE 222-230. His pontificate, coming under the reign of the Emperor Alexander Severus, was little disturbed by external persecution. The schismatic movement fostered by the self-willed rigorist Hippolytus still continued; but Urban, like his predecessor Calixtus (or Callistus) I, set himself firmly against it.—**URBAN II**, POPE 1088-99, originally Otho by name. He was Archdeacon of Auxerre, and then entered the monastery of Cluny, where he became prior. In 1078 Gregory VII called him to Rome and made him Bishop of Ostia. During almost his entire pontificate, his position was endangered by the presence in Rome of the

powerful antipope, Guibert of Ravenna, called Clement III. Urban carried on the policies of his predecessor, Gregory VII, vigorously prosecuting the struggle with Henry IV, and attacking such evils as simony, lay investiture, and clerical marriage. In 1094 he excommunicated Philip I of France for his matrimonial infidelity. He presided at the famous Council of Clermont in 1095, which gave the impulse to the Crusades. On this occasion he himself preached a famous sermon in favor of the Crusade. In 1098 a council was held at Bari, at which many Greek bishops were present, and in which the addition of the word *filioque* to the creed was discussed. He died at the close of 1099, just at the time when the First Crusade, which he had organized, terminated in the successful occupation of Jerusalem.—URBAN III, Pope 1185–87, Uberto Crivelli. Before his elevation to the papacy he was Archbishop of Milan. His quarrels with the Roman Senate compelled him to spend his pontificate in exile. He was an opponent of Frederick Barbarossa. The Emperor besieged the Pope in Verona, but was recalled to Germany by tidings of revolt there, and Urban was on the point of excommunicating him when he died near Ferrara. Consult J. Langen, *Geschichte der römischen Kirche von Gregor VII. bis Innocenz III.* (Bonn, 1893).

URBAN IV, Pope 1261–64, Jacques Pantaléon. He was the son of a shoemaker of Troyes, and rose by his talents and virtues to high positions in the Church, becoming titular Patriarch of Jerusalem in 1255. He was elected Pope at Viterbo, and spent the whole of his pontificate there and at Orvieto, being excluded from Rome by the power of Manfred, natural son of the Emperor Frederick II, against whom he incited Charles of Anjou to take up arms. He preserved a strict neutrality between the rival candidates for the Empire, and in the difficulties between Henry III of England and his barons took the side of the King. The nomination of numerous French cardinals led to the preponderance of that party, and so ultimately to the great schism. Consult Dorez and Guiraud, *Les régistres d'Urban IV* (Paris, 1892), and a biography by Georges (ib., 1865).

URBAN V, Pope 1362–70, Guillaume de Grimoard. The cardinals could not agree upon one of their own number, and therefore elected him, then abbot of Saint-Victor at Marseilles. This was at the time of the papal residence at Avignon. In 1367 he resolved to return to Rome, but finding the papal city in a condition all but ruinous, and having endeavored with little success to repress the disorder of the times, he returned to Avignon in 1370. Here he died less than a month after his return, leaving the reputation of great personal piety and zeal for the interests of religion. Consult: Magnan, *Histoire d'Urban V* (2d ed., Paris, 1863); Kirsch, *Die Rückkehr der Päpste Urban V und Gregor XI von Avignon nach Rom* (Paderborn, 1898); Ludwig Pastor, *History of the Popes*, vol. i (3d ed., London, 1906).

URBAN VI, Pope 1378–89, Bartolommeo Prignano. At the time of his election he was Archbishop of Bari. On the death of Gregory XI, who had brought back the seat of the papacy from Avignon to Rome, Prignano was elected in a conclave held under circumstances of great excitement, owing to the apprehension on the part of the populace of an intention to elect a French pope and again abandon Rome. The

most important aspect of his pontificate is that relating to the Great Schism (see SCHISM, WESTERN), which arose out of the conflicting claims to the election. While the candidate of the French cardinals took up his residence at Avignon, under the name of Clement VII, Urban occupied the papal seat in Rome. After a dispute with Charles, King of Naples, whom he had himself crowned, he died of a fall from his mule, though there were the usual suspicions of poison. Consult Ludwig Pastor, *History of the Popes*, vol. i (3d ed., London, 1906).

URBAN VII, Pope 1590, Giovanni Castagna. He had been a member of the Council of Trent in its last period, and then for several years Nuncio in Spain. Elected to succeed Sixtus V, he died 12 days later, before he could be consecrated.

URBAN VIII, Pope 1623–44, Maffeo Barberini. He was born in Florence, 1568, educated at Rome and Pisa, and destined for an ecclesiastical career. After serving twice as Nuncio to France, he was made Cardinal in 1606. Urban VIII was guilty of nepotism; but his administration was, on the whole, vigorous and enlightened. He was the founder of the celebrated College of the Propaganda, and to him Rome is indebted for many public works. Some of the early stages of the Jansenist controversy (see JANSENISM) fall within his pontificate. In the Thirty Years' War he sided with France against the Emperor and Spain. In his pontificate the Duchy of Urbino was annexed to the papal dominions.

URBAN, ur'bän, JOSEF (?–). An Austrian designer of stage settings. He was born in Vienna, where he was architect of many dwellings. In 1904 he was sent by Austria to arrange the exhibit of that country in the Fine Arts Building at the St. Louis Exposition, and he had similar commissions in the large cities of Europe. For several years he was chief artistic adviser of the Imperial Opera House in Vienna, and later was secured by Henry Russell to paint scenery for the Boston Opera Company. Subsequently he did much work in New York. His settings, characterized by originality, beauty, and imaginative power, include those made for *The Jewels of the Madonna*, *The Love of Three Kings*, *The Garden of Paradise*, James K. Hackett's productions of *Macbeth* and *The Merry Wives of Windsor*, and Percy MacKaye's Shakespeare Masque (1916).

URBAN'A. A city and the county seat of Champaign Co., Ill., 128 miles south by west of Chicago, on the Cleveland, Cincinnati, Chicago, and St. Louis, the Wabash, and the Illinois Traction railroads (Map: Illinois, H 5). It is the seat of the University of Illinois (q.v.), opened in 1868. There are the public library, the Champaign County Teachers' and Pupils' Library, and the Illinois State Laboratory and Natural History Library. The most prominent buildings are the Cunningham Deaconess Home, County Court House, high school, post office, jail, Municipal Building, and the Masonic Temple. Besides Crystal Lake Park there are two others aggregating 40 acres. Urbana is the centre of a rich farming district, and manufactures brick and tile, lawn mowers, and iron novelties. The Cleveland, Cincinnati, Chicago, and St. Louis Railroad maintains extensive shops here. Pop., 1900, 5728; 1910, 8245; 1915 (U. S. est.), 9632; 1920, 10,244.

URBANA. A city and the county seat of Champaign Co., Ohio, 47 miles west of Columbus, on the Erie, the Cleveland, Cincinnati, Chicago, and St. Louis, the Pittsburgh, Cincinnati,

Chicago, and St. Louis, and the Ohio Electric railroads (Map: Ohio, C 5). It is the seat of Urbana University (Swedenborgian) and of the Curry School (for negroes) and has a public library. Urbana is surrounded by a productive farming region and is of considerable industrial importance. Furniture, brooms, paper, oil cans, egg cases, tools, woolens, and strawboard are the leading manufactures. Urbana was laid out in 1805, and for a time in 1812 was the headquarters of the Northwestern army. It is the burial-place of the Indian fighter Simon Kenton. Pop., 1900, 6808; 1910, 7739.

URBAN SERVITUDES (from Lat. *urbanus*, relating to a city, from *urbs*, city). Easements or rights existing for the convenience or benefit of houses or other buildings, over lands or buildings belonging to a different owner. The term is employed to distinguish such servitudes from those established for the benefit of land only, which are known as rural servitudes. The most important urban servitudes are: The right to support, e.g., of resting joists and other timbers on an adjoining building; the right to have rain drip from the eaves of a building on another's land or building; the right to establish and maintain windows overlooking another's land; the rights of air and access. In New York the right to light and air is restricted to property abutting upon a highway, as the right is considered as a part of the privilege of access to and from the highway. Consult Washburn on *Easements*. See **EASEMENTS**.

URBAN TRANSPORTATION. Transportation from one point to another within a city at first was provided by coaches and other horse-drawn vehicles. Even in very early times the city required a license, or some form of registration for vehicles engaged in carrying passengers for hire. Soon after cars and rails were used for freight their availability for passengers was appreciated. The first railway was a coach, drawn by horses, running on iron rails, and as the city streets supplied a convenient and desirable route street railways developed. The right to lay tracks and operate cars for the transportation of passengers through city streets was, of course, necessarily under the direct supervision of the city. Later this was extended to lines either above or below the street surface, and the principal forms of urban transportation now are by electrically operated surface roads, cable-operated surface roads, electrically operated elevated roads, and electrically operated subways, and horse-drawn cabs, coaches, or omnibuses and motor vehicles. Almost without exception American cities require licenses for cabs and automobiles, and the various forms of railways operate under franchises granted by the city. The tariffs which cabs and automobiles may charge for given distances are specified in their licenses, and the franchises under which surface, elevated, or subway railways or omnibus lines operate almost invariably specify the charges which the company may make.

Many of the early franchises for street railways gave the railway company the right to operate over certain routes in perpetuity. A five-cent fare was prescribed for any point within the city limits, in this respect differing from European practice where fares by zones often prevail. This five-cent fare, while not universal, is the fare which by far the greatest proportion of the American street railways charge. In some cities tickets are sold six for 25 cents, and in

some cities three-cent fares, or even less, have been provided for in the franchises. The actual amount received per passenger per continuous trip on one car is generally considerably less than five cents, even where the street-railway companies' franchise provides for a five-cent fare. This is because a system of issuing transfers from one line to another is made obligatory under most street-railway franchises or by special statutes.

The progress of the mechanical means of urban transportation has been (1) horse car, (2) a car dragged along by a cable running underground, (3) a car propelled by electricity deriving its current from an overhead trolley, and (4) a car propelled by electricity deriving its current from an underground contact. Street-railway systems in American towns and cities were begun in most cases by local capitalists, and in the larger cities three or four different companies were given franchises over different streets or in different parts of the city. The later tendency has been, however, to combine the various companies operated in one city under one management, and to combine the lighting, electric-railway, and often the gas facilities of towns under one financial organization, and holding companies have been formed to control these public-utility corporations, as they are called, in a number of towns. Some of these holding companies control the street-railway and lighting facilities in a hundred or more towns and cities. Under this form of control it has been possible to raise large quantities of capital from investors who would hesitate to put their money into a single property in some town about which they knew nothing, and which was possibly two or three thousand miles from their place of residence. On the other hand, this form of financial organization makes it peculiarly difficult to form any adequate judgment as to the profitableness of urban transportation as distinguished from the other activities, lighting, manufactured gas, etc., of the public-service corporations.

A fairly typical example of a street railway in a small city is that of Portsmouth, Ohio. This city has about 27,500 inhabitants. Its street railway is electrically operated with standard 4' 8½" gauge; the total mileage is 12; the weight of rail varies from 48 pounds to 70 pounds to the yard; the street-railway companies' franchise runs for 25 years, and the franchise provides for one per cent of the gross earnings to be paid to the city in lieu of paving and other improvements to the streets. This 12-mile street railway carried 4,206,000 passengers in 1914. In the largest cities, such as New York, Chicago, Boston, and Philadelphia, the surface railway lines are supplemented by elevated lines and by subways.

The elevated lines of New York are the oldest in the United States and were originally operated with small steam locomotives. The elevated lines of Philadelphia, Chicago, and Boston were built after electric-railway operation had been tried out, and were built for operation by electric current supplied to trains from a third rail. A short description of the urban transportation systems of some of these cities will make clear how complicated this problem of urban transportation is. The total length of main lines of surface street railway in Boston in 1915 was 231 miles, of which mileage 197 miles had a second track. There were approxi-

mately 14 miles of rapid-transit track, all of which had second track. The gross earnings of this system in the fiscal year ending June 30, 1915, was \$17,269,000, and total operating expenses amounted to \$11,288,000. The total number of passengers carried was 346,317,000. The total number of car miles run was 57,806,000. The rapid-transit facilities include both elevated lines and subways.

The Chicago Railways Company, which does not operate all of the railways in and about Chicago, but which operates the principal surface lines and the elevated lines (Chicago up to 1916 had no passenger subway lines), operates 500 miles of track. The company has two power-generating stations. It operates under a 20-year franchise, which provides, however, that the city may buy the property at an agreed valuation plus capital expenditures, which are made on the property subsequent to the date of valuation. In 1913 the agreed valuation of this property was \$83,757,957. The company is permitted to charge a straight five-cent fare, but must give universal transfers. There is an agreement between the city and the company, by which the company is to pay to the city 55 per cent of surplus earnings over and above operating expenses and five per cent on the agreed valuation. The agreed valuation is raised year by year by the amount which the company spends for additions and betterments. In 1915 the total operating revenues of this system were in round numbers \$31,966,000; operating expenses, \$19,889,000; 5 per cent on the agreed valuation as of that year called for \$4,117,000, and after the payment of rentals and the share belonging to another railway company there was \$3,064,000 left to be divided between the city and the Chicago Railways Company. Of this the city got \$1,685,000. While this partnership agreement has not been in effect long enough to permit of any final conclusions being drawn in regard to its operation, up to 1915 it has proven quite satisfactory to both the city and to security holders of the railway company.

It has been peculiarly easy for politicians to arouse antagonism against public-utility corporations, and especially against the street railways. The unavoidable annoyance which every one experiences on crowded cars, and the fact that citizens feel as helpless against a street-railway corporation as they do against any other form of monopoly, makes it a temptation on the part of candidates for city offices to conduct a campaign based on a promise to get something out of the street-railway company. Furthermore profits have often appeared very large, and then it has been discovered that the assets of the company have been consumed in the process of earning what appeared to be profits, and the security holders are left with comparatively little to show for their investments. The scheme of having the city a partner to share these profits has taken away something of the incentive to show abnormal profits at the expense of the deterioration of assets, and has also lessened the jealousy with which a peculiarly profitable year of street-railway operation is viewed by the average citizen.

The urban transportation system of Greater New York presents the most complicated aggregate of street-railway lines, elevated lines, and subways of all cities in the world. At Grand Central Terminal, 42d Street and Fourth Avenue, provision has been made for five levels of

urban transportation facilities. The uppermost of them is the elevated road, operated by electricity from a third rail; below this is the electric surface line, operated by electricity from an underground contact; below this is the four-track subway which has been in operation since 1904; below this again is the subway built to supplement the old system of subways and elevated lines; and still lower is the Belmont Tube, as it is called, which is a tunnel built from Fourth Avenue and 42d Street east under the eastern half of Manhattan Island and under the East River to Queensboro, Long Island.

The history of New York street railways illustrates in a striking manner some of the phases of the development of urban transportation in the larger cities of the United States. The first street railways were horse-drawn cars, and there were still horse-drawn cars in Manhattan in 1916. The shape of Manhattan and the fact that it is an island which, on the west, south, and east, is separated from the mainland or other islands by a broad body of water, while on the north it is separated from the mainland only by a narrow stream, make it necessary to provide for a very heavy traffic north and south bound, with a comparatively light traffic east and west bound. As fast as transportation could be provided, the city spread northward, and land values rose with great rapidity. The north and south elevated lines, which were at first operated by steam locomotives trailing five or six cars, have already been mentioned. The horse-car line, which ran north and south on Broadway, was replaced by a cable road, and apparently the profits, from this and from the elevated roads and horse-car lines, were out of all proportion to the amount invested. When, however, it was found that electrically operated surface cars were more desirable from every point of view, an additional huge investment had to be made in the substitution of electric cars, with underground conduits, for the old cable cars. During the time of operation by cable and horse cars nothing had been accumulated as a reserve against depreciation or obsolescence of that form of locomotion. The entire cost, therefore, of the electric railways was superimposed on the original cost of cable railways and of horse-car lines, and the various companies operating these lines were merged through the creation of holding companies which not only had to raise great sums of money for additional investment, but also took in the old lines at a very extravagant capitalization. The law required street railways operated by the same company to give free transfers. No time limit was punched on a transfer except the date, and it was possible for a person to ride almost all day on one five-cent fare. The result of operating conditions such as this and of excessive capitalization was bankruptcy for all of the important street-railway companies, exclusive of the elevated roads in Manhattan.

In the meantime an extensive system of urban transportation had been developed in Brooklyn which connected with lower Manhattan by operating cars across the Brooklyn Bridge. There were four sets of tracks on Brooklyn Bridge, two used by surface cars and two by the elevated railways of Brooklyn. The Brooklyn elevated roads, like Manhattan, were at first operated by small steam locomotives and were later converted into electric roads operated from a third rail. One holding and operating company got control of the greater part of the transportation

facilities of Brooklyn, and there were years in which one set of politicians would use persecution of the Brooklyn Rapid Transit Company as a campaign issue to get into office, alternating with years in which the Brooklyn Rapid Transit Company, with connivance of local politicians, gave the city a very indifferent service. Within recent years conditions have very greatly improved. The financial structure of the Brooklyn Rapid Transit was strengthened until its credit ranked with that of steam railways and the service brought up to the standard which a city of that size might reasonably expect.

In 1902 New York City entered into an agreement with the Interborough Rapid Transit Company, by which that company was to build a subway running from the Battery to 96th Street, and there branching with one line to 250th Street and Broadway, and the other to 180th Street and Bronx Park. This company also undertook to build a double-track tunnel under the East River, from a point south of Bowling Green to a point in Brooklyn. The Interborough Rapid Transit in 1913 also leased the elevated railways in Manhattan. The mileage of the subway described above had a total length of 25.72 miles, and the elevated lines taken over had a total length of 37.67. Of the subway mileage 7.50 miles were four-track road, 7.18 miles three-track road, and 10.41 miles two-track road, leaving less than a mile of single track. The extension into Brooklyn permitted the Interborough Rapid Transit to compete with the Brooklyn Rapid Transit for business between the two boroughs. This temporarily relieved the congestion of traffic at the rush hours, morning and evening, on Brooklyn Bridge, but so quickly does population follow rapid-transit facilities in New York that within four years after the opening of the subway connecting the two boroughs, the pressure of traffic over Brooklyn Bridge was as great as ever, and additional facilities were urgently demanded.

Negotiations which had been going on for some years between the New York Public Service Commission, the duty of which was to regulate New York City urban transportation facilities, the Brooklyn Rapid Transit, and the Interborough Rapid Transit, for the construction of additional facilities, took definite shape in 1911 and were finally consummated in the contracts which were signed March 19, 1913, between the city of New York and the Municipal Railway Corporation, and contracts which were signed at about the same time between the Interborough Rapid Transit Company and New York City. This agreement provided for the construction of what is known as the dual subway system. The New York Municipal Railway Corporation was the subsidiary of the Brooklyn Rapid Transit, and the new subway system was to be built in part by money furnished by the city of New York and in part by money furnished by the Brooklyn Rapid Transit Company and the Interborough Rapid Transit Company. In addition to a system of subways the Brooklyn Rapid Transit and the Interborough Rapid Transit agreed to extend their elevated lines and to add to the capacity of these lines by, in some instances, third tracking them, and in other instances adding a second story to the elevated structure to carry two additional tracks.

The problem of adequate transportation facilities at Chicago is not as complicated as that at New York, and the general scheme adopted is

that of having a circular elevated line making a loop about the business section of the city. From this loop elevated lines radiate out into the residential districts. Elevated trains can therefore come in in the morning from the residential districts, discharge their passengers on the various stations on the loop, and go back out. This makes a very heavy traffic during rush hours on the loop, but since the lines radiate in three directions the traffic as soon as it leaves the loop has comparatively little congestion.

New York Subways. As previously stated, the city of New York has the most extensive system of subways in the United States. The first subway system consisted of over 20 miles of road, much of which is four track. This is being supplemented by the above-mentioned dual subway system. The construction of both the first subway system and the dual system was carried on by private contractors, who submitted bids to the New York Public Service Commission, and whose bids and work were subject to the approval of the commission. The character of the work north of 53d Street was largely through solid rock. South of Houston Street it was almost entirely sand, no blasting was necessary, and the excavated material could be dislodged with pick and shovel. Here it was necessary to underpin buildings along the route and to use an elaborate system of timbering to hold up the sides of the cut and sustain the temporary pavement in the street. In the construction of the new dual subway it was necessary to go under a part of the old Astor House, the oldest of New York's first-class hotels standing in 1910, and cross a corner of St. Paul's Churchyard, and all of this work necessitated elaborate precaution for the prevention of cave-ins.

The first subway was necessarily experimental in some particulars. In general its design has been found to be particularly satisfactory. Its operation, however, has brought out certain defects which are avoided in the dual subway. Some of the stations of the first subway were built on curves. Operation of the subway during morning and evening traffic is carried on at the greatest possible physical capacity, and the fact that trains have to slow down when they approach stations situated on curves sooner than they would were the stations on tangent tends to produce congestion at these points. The curved platform also leaves a considerable space between the car platform and the station platform, which, in rush hours, is a source of danger.

The first subway, throughout the greater part of its four-track sections, had all four tracks placed in one tunnel. This arrangement interferes with the full effect of train movement on ventilation. Frequent passage of trains stirred up the air, but did not renew it, and various ventilating devices have had to be installed. The dual subway has a partition between each pair of tracks, so that there will be a tunnel for trains going one way and another tunnel for those going in the opposite direction. In this operation wall archways have been provided at frequent intervals as places of safety for track laborers. Where there are only two tracks, these are separated by a partition. The accompanying drawing shows a cross section of the four-track subway under the Harlem River, where each one of the four tracks is to be placed in a separate tunnel. In summer the heat in the

first subway has been excessive. Much of this heat is believed to be due to friction of brake shoes on wheels and wheels on tracks, and also of course to the operation of the electric motors underneath the cars. In the first subway waterproofing was used under the floor, up the sides of the tunnel, and over the roof, and, while this waterproofing keeps the water out, it keeps the heat in. In the dual subway less waterproofing is being used and is placed only along the sides where the tunnel runs below the water level, as is the case in the accompanying cross sectioning. The waterproofing used in the dual system consists of layers of woven fabric and asphalt and brick laid in asphalt. The first subway has a height of 12 feet, 10 inches above the base of the rail and has a width of 12 feet, 6 inches for each track. The new Fourth Avenue and Centre Street subways have a maximum height of 15 feet above the base of the rail and a width of

motor traffic shows that the number of passengers by tramway in 1911 was 821,819,741; by omnibuses, 400,628,487; by local railways, 436,398,745; and by trunk-line railway from a 30-mile limit, approximately 250,000,000.

Omnibus service in London plays a very important part in the urban transportation, as will be seen from the above figures. The shortest omnibus route, according to the report of the Select Committee, made in 1912, was 2.2 miles and the longest was 18.9 miles, and the total number of omnibuses required for service on week days in 1911 was 2279 and on Sundays 3390. An investigation made by the London police shows that on Oct. 13, 1913, there were 2700 busses in daily operation and an average of about 300 in the shops. The average fare per passenger on omnibuses in 1913 was 1.12 pence (2.24 cents). There is no transferring between the various bus lines. A report made by George

CROSS SECTION OF FOUR-TRACK SUBWAY UNDER HARLEM RIVER OF NEW YORK DUAL RAPID-TRANSIT SYSTEM.

14 feet for each track. The Broadway subways have a height above the base of the rail of 13 feet, 2 inches and a width of 13 feet, 6 inches for each track. Express stations in both the first subway and the dual subway are built to accommodate ten-car trains and local stations to accommodate six-car trains. Originally the first subway was built with express stations to accommodate but eight cars and local stations to accommodate but five cars. These, however, were later lengthened.

The first subway was built in good part as an open cut, which was later roofed over. The dual subway has been built almost entirely as a tunnel, the street surface being maintained as a roof, thus minimizing the interference of street traffic.

London. The transportation facilities of the city of London may be classified under the head of cabs, omnibuses, tramcars, local railways, and trunk-line railways carrying the passengers from a 30-mile limit.

The report of the London Traffic Branch of the Board of Trade shows that the population of the County of London, which is the Metropolitan District, decreased from 4,536,269 in 1901 to 4,521,685 in 1911, and it is estimated that the migration into the outskirts from the Metropolitan District has been more rapid since 1910 than in the years preceding. The population of the whole area of Greater London increased from 6,581,402 in 1901 to 7,251,358 in 1911 and is given by the Registrar General at 7,340,079 for 1912. The report of the Select Committee on

Keegan and E. T. Wood, assistant to the vice president and general manager of the Interborough Rapid Transit Company and assistant to the vice president and general manager of the New York Railways Company, respectively, estimated that, considering the difference in the purchasing power of money in London and New York, the average of 2.24 cents for London is somewhat higher than the average $3\frac{1}{2}$ cents paid by passengers on the New York surface car lines. The average length of ride of passengers on the busses is about 1.6 miles, according to the report of the Select Committee, and the average ride per tramway passenger is 1.93 miles. Employees and policemen in uniform are carried free.

The frequency of bus service in London varies from 1 minute headway to 15 minutes. The busses make from 110 to 120 miles a day, carrying 34 seated passengers, of which 18 are on top and 16 inside. Busses stop almost anywhere to take up passengers.

Underground Lines.—The report of the London Traffic Board of Trade for 1913 shows the mileage of electric so-called underground railways in the metropolitan area to be 132 miles; of this, 60 route miles are underground and the remainder on the surface. All of the underground electric railways are controlled by one of three companies: the Underground Electric Railways Company of London; the Metropolitan Railway Company; the Great Northern and City Railway Company. In 1912 the Underground Electric Railways Company carried 226,

894,711 passengers, outside of season-ticket passengers, and 20,459,828 season-ticket passengers. In 1913 this system carried 225,990,674 passengers, outside of season-ticket passengers. The passenger receipts in 1912 were £1,772,791 (\$8,863,955) and, in 1913, £1,791,957 (\$8,959,785). Various reports which were made in 1912 and 1913 by the Underground Electric Railways Company's management and by boards of trades comment on the success with which motor busses have been competing for not only the normal increase in traffic, but for the passenger traffic which had previously belonged to the underground railways.

The Metropolitan Railways Company, which was the old underground before the Underground Electric Railways of London entered the field, and which was originally operated with steam locomotives, carried, in 1912, 100,146,324 passengers. The average receipts per passenger were 1.486 pence (2.972 cents). Workingmen are carried at a reduced rate and in some instances may travel 16 miles for 2 pence (4 cents). Round-trip tickets are sold, which are roughly one and a half times one-way tickets.

The total number of passengers carried on all of the electric railways, including the Underground Electric of London and the Metropolitan Railway, mentioned above, was 360,325,001 in 1912. The equipment of the underground railways consists of cars of many different types. The average number of seats is 48.

Tramways.—With a few exceptions, all of the tramway lines in the County of London are operated by the London County Council. The report of the London County Council shows that, for the year ending March 31, 1913, there were 512,652,653 passengers carried on the tramways; the passenger revenue was £2,181,103 (\$10,905,515); the average receipts per passenger carried was 1.02 pence (2.04 cents); and the car miles operated was 53,943,104. The average number of cars in use on electric lines was 1.237 in 1913, and a large number of trailer cars are in use, many of which have double decks. The ordinary car seats 36 persons downstairs and 42 persons upstairs. The trailer cars seat 48 persons. The cars are operated within the more congested city limits from underground trolleys, but many of them are equipped to operate also by overhead trolleys, and change at points on their way to or from the city from one system to the other.

Paris. The principal means of urban transportation in Paris, France, are subway lines, omnibuses, tramway lines, taxicabs, steam-car lines entering Paris, and the small steamers running on the Seine. According to the 1911 census, the population of the city of Paris within the fortifications was 2,888,110. The population of the environs was about 460,000. The subways of Paris are all under the control of the Chemin de Fer Metropolitain, with the exception of one line operated by a steam-railroad company. All of the lines lie entirely within the fortifications of Paris; some of them are elevated instead of being in subways. In the fiscal year ending June 30, 1912, the total number of passengers carried on this Metropolitan system, not counting transfer passengers, was 383,190,000. This compares with 302,973,856 passengers carried in the same year in the New York City subway. First-class tickets on the Paris subways are 25 centimes (about 5 cents) and second-class tickets 15 centimes (3 cents). Sec-

ond-class tickets to go before nine A.M. and return any time during the day, are sold for 4 cents. There are no reduced-rate return tickets for first-class passengers. Approximately the total passenger traffic is divided into 15 per cent first-class passengers, 55 per cent second-class passengers, and 30 per cent second-class passengers go and return. As a rule there is no limitation on transfer privilege in the subway, except an attempt to prevent a system of transfers which would permit a passenger to return to his starting point.

Equipment.—Subway trains are usually made up of five cars, the centre car being a first class and the other four cars second class. The capacity varies from 50 to 90, the rated capacity being for about an equal number of standing and sitting passengers. There is a congestion at morning and evening hours, and sometimes as many as 75 standing passengers per car, but even a report made by representatives of the Interborough Rapid Transit Company and the New York City Railways, mentioned previously, says that the rush-hour congestion in Paris is not nearly so great as that in New York. The headway between trains during rush hours is 2 minutes, 11 seconds, and the distance between stations is about 1600 feet. There is no express service.

Omnibuses.—The General Omnibus Company of Paris controls all of the busses, and in 1913 owned about 1032 busses, of which 850 were in daily service. The bus lines do not extend beyond the fortifications, and there is usually not more than one bus line on a street. These lines usually run from the outgoing points to the centre of the city, and none of them run all the way across the city. There is usually from two to three sections on each bus line, and the fare for one section first class is 15 centimes (3 cents) and second class 10 centimes (2 cents). A person riding over more than one section, or beyond the limits of one section, pays 25 centimes (5 cents) first class and 15 centimes (3 cents) second class. The length of a section is about 1½ miles. Standing passengers are permitted on the rear platform only, and the distance between stopping points is about 1300 feet. The most frequent headway is 1 minute, 10 seconds, and the headway varies from this to about 7 to 8 minutes. The average speed of the busses is about 8½ miles an hour, and the maximum is 14 miles an hour. The busses accommodate 30 to 35 passengers. Single-deck omnibuses are used, the double-deck busses having been abandoned on account of expense and the greater time required to load and unload.

Tramways.—The two largest tramway companies are the General Omnibus Company and the Tramways de Paris et du Departement de la Seine. The arrangement of the lines is on the zone principle, and passengers pay fares for each zone. The fare is usually 15 centimes (3 cents) for each zone first class and 10 centimes (2 cents) for each zone second class. First-class passengers pay about 2.4 cents for each mile outside of the fortifications and a little less than 1 cent for each mile within the fortifications. Cars operating single or in trains of two cars, and in the suburbs of three cars, are run by compressed air, steam, storage battery and overhead trolley, or underground electric trolley. There are both single and double deck cars in use. Various types and sizes of cars are in use, many having a seating capacity

for 30 passengers and a standing capacity for 19 passengers. The trailers have, in many cases, seating capacity for 38 passengers and will carry 19 standing passengers.

The report of the Inspector General of Police, in charge of tramways and local railways, for the year ending Dec. 31, 1911, shows a total number of passengers carried by tramway lines as 438,634,210; omnibus lines, 135,722,473; subways, 419,894,539; a total of 994,262,222.

Municipal Ownership. As an example of municipal ownership and operation of street railways, Leith, Scotland, may be taken as an instance where this form of management is in successful operation. The tramways department of the Burgh of Leith operates a little over 9 miles of tramway, nearly all of which is double track. This serves a population of 80,400. The total revenue in 1913 was £35,693 (\$178,465). The total number of passengers carried was 9,706,611 and of car miles run was 944,329. The average car miles per car per day was 125. The average total revenue per car miles was 9.07d. (18.14 cents) and the average expenses, including power cost, was 4.08d. (8.16 cents). The average fare paid by each passenger was 0.87d. (1.74 cents).

Since 1894 the corporation of the city of Glasgow, Scotland, has operated the tramways of that city. The city between 1894 and 1903 had changed the system from horse cars to overhead trolley and extended it from 60 miles to 132. In 1903 the car mileage was 14,008,750, the number of passengers carried 177,179,549, and total receipts amounted to £653,200 (\$3,266,000). Fares are on a mileage basis, the half mile being taken as the unit. The fare for the first 0.58 mile is $\frac{1}{2}$ d. (1 cent) and is graded from that figure up to 4d. (8 cents) for 9.09 miles.

Gephart, *Transportation and Industrial Development in the Middle West* (ib., 1900); L. G. McPherson, *Transportation in Europe* (ib., 1910). See STREET RAILWAY; TUNNEL.

URBINO, ūr-bē'nō. A city in the Province of Pesaro e Urbino, Italy, situated on a hill amid the eastern outliers of the Apennines, between the Metauro and the Foglia, 25 miles southwest of Pesaro (Map: Italy, D 3). The streets are narrow and tortuous, but gorgeous views are obtained of the mountains and the Adriatic. The house in which Raphael was born is now fitted up as a museum, and belongs to the Reale Accademia Raffaello. The new cathedral is interesting for its paintings. In the church of Santo Spirito are noteworthy pictures by Luca Signorelli, and in the San Domenico are good reliefs by Luca della Robbia. The Oratorio della Confraternità di San Giovanni Battista is a splendid structure. The famous ducal palace was erected in the fifteenth century. It is rich in interesting sculptures and decorations, and has a collection of Roman inscriptions and a biblical picture gallery. The city has a free university, founded in 1671, and an academy of fine arts. The celebrated library has been removed to Rome. Urbino manufactures silks, majolica, bricks, lime, oil, and cheese. There are in the vicinity sulphur and travertine quarries. Pop. (commune), 1901, 18,307; 1911, 18,117.

Urbino, the ancient Urbinum, was an important city under the Romans. It became very

prosperous in the fourteenth century. Federico da Montefeltre, who ruled from 1444 to 1482 and who was elevated by the Pope to the dignity of Duke of Urbino in 1474, maintained a magnificent court, built the palace, and made the city a centre of science and art. During the sixteenth century, under the Della Rovere family, Urbino was important in the manufacture of majolica. It was a papal possession from 1626 to 1860.

URBS VETUS. See ORVIETO.

URCHARD, SIR THOMAS. See URQUHART.

URCHIN, KEYHOLE. See SAND DOLLAR.

URDANETA, ūr'dā-nā'tā. A town of Luzon, Philippines, in the Province of Pangasinán, situated 27 miles southeast of Lingayen (Map: Philippine Islands, C 2). Pop., 1903, 20,544.

URDU, ūr'dū. The speech of the Mohammedan population of central Hindustan, and a sort of lingua franca for almost all the peninsula. See HINDUSTANI LANGUAGE AND LITERATURE.

URE, ALEXANDER. See STRATHCLYDE, ALEXANDER URE, BARON.

URE, ANDREW (1778-1857). A Scottish chemist, born at Glasgow. He studied at Glasgow and Edinburgh. In 1802 he became professor of chemistry and natural philosophy in the Andersonian Institution at Glasgow; took an active part in the establishment (1809) of the Glasgow Observatory, and was appointed its first director. He published a number of valuable works, his two dictionaries remaining for many years the standard books of reference: viz., his *Dictionary of Chemistry* (2 vols., 1821), and *A Dictionary of Arts, Manufactures, and Mines* (1837 and several later editions).

UREA (Neo-Lat., from Gk. οὔρον, ouron, urine), or CARBAMIDE, CO(NH₂)₂. An organic substance which derives its name from its having been originally discovered in urine, of which it forms the most important and characteristic ingredient. Pure urea is devoid of smell, has a coolish, bitter taste, like that of saltpetre (which it closely resembles in its external form), and is very slightly deliquescent. It is readily soluble in water and alcohol, but only slightly in ether. It melts at 132° C. (270° F.); dry urea may be sublimed without decomposition by heating in vacuo between 120° and 130° C. (248°-266° F.). If sublimed in vacuo at temperatures between 160° and 190° C. (320°-374° F.), it changes into ammonium cyanate. If heated, under ordinary pressure, to 150°-160° C. (302°-320° F.), it is decomposed with formation of ammonia, cyanuric acid, biuret, and carbonic acid; the formation of biuret is represented by the following chemical equation:

The formation of cyanuric acid (C₃H₃N₃O₃) takes place indirectly, probably through the combination of biuret with cyanic acid.

One of the most important methods for the quantitative determination of urea in urine was proposed by Folin in 1901 and improved by Benedict in 1910. The method consists in adding to a small measured specimen of urine a certain quantity of hydrated magnesium chloride, some acid potassium sulphate, some zinc sulphate and a little powdered pumice and paraffin wax, boiling to dryness, heating for an hour at 165° C. (329° F.), adding sodium hydroxide, and distilling the freed ammonia into a measured

acid radicle; thus symmetrical diacetyl urea is obtained by the action of acetamide upon carbonyl chloride, the reaction taking place according to the following chemical equation:

Among the important ureides is that of carbonic acid, called allophanic acid. Its formula is

weak acid, its alkaline salts being decomposed even by carbonic acid. The substance biuret, formed by heating urea somewhat above 150° C. (302° F.) (see UREA), is the amide of allophanic

URIC ACID.

When the alkyl ureas (i.e., the compound ureas formed by replacing hydrogen in urea by alcohol radicles) are boiled with alkalis, decomposition ensues resulting in the formation of amines, ammonia, and carbonic acid. Methyl urea, e.g., is thus hydrolyzed according to the following chemical equation:

The ureides are more or less readily saponified by the action of alkalis; acetyl urea, e.g., being decomposed according to the following equation:

UREDINALES, ú-réd'í-ná'léz (Neo-Lat. nom. pl., from Lat. *uredo*, blight, blast, from *urere*, Skt. *us*, to burn). A group of fungi familiarly called rusts which live as parasites chiefly on flowering plants. One of the striking features of the group is the extreme form of polymorphism exhibited, i.e., the production of more than one spore-bearing form in the life cycle. The rusts are known to develop five kinds of spores: pycnospores (spermatia), acidiospores, uredospores, teleutospores, and basidiospores (sporidia). These do not all occur in every case, the teleutospores and the basidiospores being the only forms always present. The various spore forms may all develop on one host, in which case the rust is said to be autoecious or autoicous; or they may be developed on different hosts, in which case the rust is heteroecious or heteroicous. The teleutospores are the most variable spores, and therefore their characters are of the greatest service in classification.

In such a heteroecious form as *Puccinia graminis*, one of the common wheat rusts, the life cycle is as follows. The mycelium (the filamentous body of the fungus) traverses the tissues of the young wheat plant, and sends to the surface the uredospores, which form the reddish spots or lines that suggested the name rust. By means of scattered uredospores the disease spreads rapidly through growing wheat.

RUST.

1, section of leaf of barberry with cluster cups (acidia below and spermatogonia above; 2, uredospores and one teleutospore; 3, germinating teleutospore with four-celled promycelium.

As the wheat plant matures, the mycelium sends to the surface the teleutospores, dark and thick walled spores that last through the winter. The teleutospore germinates in the spring, and gives rise to the basidium (promycelium), a filament of four cells, each of which produces a slender branch bearing a basidiospore (sporidium). The basidiospores that fall on young barberry leaves germinate and form an extensive mycelium in the leaf. This mycelium gives rise to pycnospores and acidiospores. The latter occur in clusters called cluster cups, and these spores, falling upon young wheat plants, germinate and produce the mycelium that later bears uredospores and then teleutospores. In this life history the fungus passes through three distinct phases, viz., the parasitic mycelium bearing uredospores and teleutospores, the saprophytic basidium bearing basidiospores, and the parasitic mycelium bearing pycnospores and acidiospores.

As might be expected, the complete life histories of comparatively few heteroecious rusts are known, but the completion of the life histories is progressing very rapidly at the present time. The two hosts do not suggest one another, e.g., wheat and barberry, and therefore numerous

rusts are known only in various stages, and bear the names of form genera; e.g., *Uredo* (uredospore forms), *Puccinia* (teleutospore forms), and *Æcidium* (æcidiospore forms). When these forms are connected in a life history the name of the fungus becomes *Puccinia*.

One of the important problems connected with the cereal rusts is the winter condition, and this chiefly relates to the question whether any short cuts in the life history are possible; e.g., whether uredospores can survive the winter and infect the crop of the next season.

For a general account of the Uredinales consult Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887), and Plowright, *British Uredineæ and Ustilagineæ* (London, 1889). See BASIDIOMYCETES; RUST.

URENA (Neo-Lat., from *uren*, the native Malabar name). A genus of herbs of the family Malvaceæ. The bark is very fibrous; and the fibre of *Urena lobata* and *Urena sinuata*, weeds common in most parts of India, is used as a substitute for flax in making cordage and paper stock. It is strong and fine and in many ways resembles jute, for which it is a good substitute. *Urena lobata* grows in various parts of the United States, particularly in the State of Florida, where the plant has often been mistaken for ramie.

UREÑA, COUNT OF. See OSUNA, DUKE OF.

UREN'TES A'QUÆ. See ORENSE.

URETER (Gk. οὐρητήρ, *ourêtēr*, ureter, urethra, from οὖρον, *ouron*, urine). One of two canals by which the urine is conveyed from the pelvis of the kidney (q.v.) on either side to the base of the bladder. Each ureter is about 18 inches in length, and enters the bladder in so slanting a direction as to prevent regurgitation. When a concretion is formed in the kidney, the ordinary and most favorable event is that it should descend through the ureter to the bladder. The passage of a stone through this tube gives rise to renal colic, a series of violent symptoms, consisting of sudden and most severe pain, first in the loins and groin, subsequently in the testes (in the male) under the thigh; the testes may be retracted spasmodically. Coincident with the pain there are violent sickness, faintness, and collapse, which may last two or three days, and are only relieved when the stone reaches the bladder. The treatment consists in the warm bath, and the inhalation of chloroform or opium in large doses (both of which serve to allay spasm and deaden pain), and the free use of diluents to wash down the concretion.

URETHRA (Lat., from Gk. οὐρήθρα, *ourêthra*, passage for urine, from οὖρον, *ouron*, urine). The canal by which the urine is discharged from the bladder. The male urethra is about 9 inches long, and its office is to conduct the seminal fluid, secondarily to discharge the urine. It is divided into three parts: (1) the deep or prostatic urethra, which extends from the outlet of the bladder (with which it is continuous) through the prostate gland, being the part into which the seminal ducts open; (2) the membranous urethra, less than an inch long, extending from the prostate forward; and (3) the cavernous, or spongy, or penile urethra, extending through the erectile tissue to the end of the penis. The female urethra is less than 2 inches in length and opens externally between the upper margin of the vaginal entrance and the clitoris. The urethra is lined by a continuation of the mucous membrane of the bladder, and in

the male is extremely sensitive. See GONORRHEEA; STRICTURE.

URETHRITIS, ū-rê-thrî'tis. See GONORRHEEA.

URFAH, ū-r'fā', or **ORFA**. The modern name for Edessa (q.v.).

URFAHR, ūr'fā'r. A town in the Crownland of Upper Austria, on the left bank of the Danube, opposite Linz (q.v.), with which it is connected by an iron bridge (Map: Austria-Hungary, D 2). It manufactures spirits and machinery. Pop., 1900, 12,827; 1910, 15,441.

URFÉ, ūr'fā', HONORÉ D' (1568-1625). A French pastoral romancer, born in Marseilles of noble family. D'Urfé was educated for the Church, but married his sister-in-law, Diane de Châteaumorand (1600). On the fall of the League he withdrew to Savoy and began to write in the pastoral style suggested by the Spanish *Amadis de Gaul*, which had been translated into French at the instigation of Francis I (1540-48), and by the Greek pastoral romances which were rendered into French early in the sixteenth century. Fiction of this character had made a timid appearance in France before D'Urfé, e.g., in Fumée's *Du vray et parfait amour* (1599). It had already acquired its great masterpieces in Italy (Puliziano's *Orfea*, 1471 or 1472; Sannazaro's *Arcadia*; Tasso's *Aminta*, 1573; Guarini's *Pastor Fido*, 1590), in England (Spenser's *Shepherd's Calendar*, 1570), and in Spain (Montemayor's *Diana*, 1542; Gil Polo's *Diana Enamorada*, 1504, and Cervantes' *Galatea*, 1851). All these romances were popular in France, but D'Urfé's *Astrée* was the first that became a sort of social breviary for a generation. It is a novel of 5155 pages. Its first two volumes appeared in 1610, the third in 1619, the posthumous fourth and fifth in 1627, with other unofficial continuations. Of this interminable treatise on the verb *aimer*, D'Urfé borrows his pastoral scenes from the *Diana*, his warlike episodes from *Amadis*, and from the Greeks and Latins some episodes and much of his story-telling art; but he is superior to them all in character drawing, in good humor, and in the higher social aim of his work. In the subtle differentiation of his lovers, D'Urfé is a not unworthy forerunner of Racine and Marivaux, unapproached by any novelist of his century but Madame de Lafayette. D'Urfé was a sort of realistic idealist; he chose the scene of his own birth, the banks of the Lignon, for the scene of his novel, and his conversations are lively, far beyond the wont of his time. His aim throughout is the refinement of society, and here its influence is hard to overestimate. The Hôtel de Rambouillet seems to have been organized in its imitation. *Astrée's* popularity was astounding. Bishops like Camus, saints like Francis de Sales, joined with realistic novelists like Sorel to sound the praise of this "exquisite work." La Fontaine, the scholarly Huet, the sprightly Fontenelle, the cynic La Rochefoucauld, all rejoiced in it. For two generations it was an accepted book of reference on deportment and breeding. In Germany, in 1624, a princely and aristocratic coterie, on organizing an *Académie des vrais amants*, assumed the names of the characters of the *Astrée*.

Consult: Bonafous, *Etude sur l'Astrée et sur H. d'Urfé* (Paris, 1846); Körting, *Geschichte des französischen Romans im 17ten Jahrhundert*, vol. i (Oppeln, 1885); W. Fischer, *Lafontaine and the Astrée of Honoré d'Urfé* (Philadelphia, 1913).

URGA, ᠤᠷᠭᠠ (Chin. *K'ulun*). The capital of northern Mongolia, situated on the Tola River and the highway leading from Kiakhta (q.v.) to Peking, 175 miles south of Kiakhta (Map: China, J 2). It consists of the Mongolian town, inhabited mostly by lamas, and of the Chinese town, a few miles distant, where the Chinese and Russian merchants live. In the Mongolian town is situated the residence of the head of the Lamaist church in Mongolia. There are also numerous temples surrounded by the houses of the lamas. In the temple of Maidary is a colossal gilt statue of that divinity, over 33 feet high. During the religious festivals the town is visited by great numbers of pilgrims. Pop., about 25,000 Chinese and 13,000 Lamaist monks.

URGEL, ᠤᠷᠭᠡᠯ. An ancient episcopal see in northern Spain, with an interesting history closely related to that of the Republic of Andorra (q.v.). It was also a county, the lordship of which was acquired by marriage early in the thirteenth century by the comtes de Foix.

URI, ᠤᠷᠢ. A canton of Switzerland (Map: Switzerland, C 2). Area, 415 square miles. The region consists of the narrow valley of the Reuss, surrounded by offshoots of the Bernese Alps on the west, the Glarus Alps on the east, and the St. Gotthard group on the south. Many of the peaks exceed 10,000 feet, the Dammastock rising to 11,920 feet. The climate is raw. Uri is primarily a pastoral canton, and exports chiefly dairy products. The principal manufactures are dynamite and parquet floors. The legislative authority is exercised directly by the people assembled in the Landsgemeinde. The canton is represented by one member in the Federal Council. Pop., 1910, 22,055, nearly all German-speaking Roman Catholics. Capital, Altdorf (q.v.).

Uri, first mentioned in 732, passed in the thirteenth century to the Hapsburgs. It gradually obtained its independence and in 1291 formed the perpetual league with Schwyz and Unterwalden. In the fifteenth century the Val Leventina (now a part of Ticino) was acquired by Uri. The canton took part in the Sonderbund (q.v.).

URI. Another name for the Limpopo (q.v.), a river of South Africa.

URIAL. See OORIAL.

URIAN, *Ger. prom.* ᠤᠷᠢᠭᠠᠨ, *SIR*. A name, like the modern Mr. Blank, once used to designate one whose real name was either unknown or unmentionable. It occasionally occurs in German and English literature before the nineteenth century, and is sometimes used of Satan. In Wolfram von Eschenbach's *Parzival* it is applied to the evil-minded Prince of Punturtois.

URIBURU, ᠤᠷᠢᠪᠦᠷᠦ, *José* (1835-1914). An Argentine diplomat and president. He was educated at the University of Buenos Aires and entered the diplomatic service, in which he spent 20 years. While Minister to Chile he gave refuge to President Balmaceda (q.v.) during the Chilean revolution of 1891. He was elected Vice President of Argentina in 1892, chiefly because he had no political affiliations. Upon the resignation of President Luis Saenz Peña in 1895, Uriburu assumed the office to fill out the unexpired term. During his administration defense measures were undertaken, bonds were issued to pay off the claims of the foreign-owned railway companies, steps were taken to rehabilitate the credit of the country, and delicate boundary questions with Chile, Bolivia, and Brazil were dealt with. Uriburu was an unsuccessful candidate for the presidency in 1904.

URIC ACID (from Gk. οὔρον, *oureon*, urine), $C_5H_4N_2O_6$. A compound of carbon, hydrogen, nitrogen, and oxygen, which forms a loose white powder or scales consisting of minute crystals devoid of smell or taste, only very slightly soluble in water (1 part requiring about 15,000 parts of cold and 1600 of boiling water), and quite insoluble in alcohol and ether. It is soluble without decomposition in strong sulphuric acid, and it may be thrown down from this solution by the addition of water. It is also soluble in the carbonates, borates, phosphates, lactates, and acetates of the alkalies, extracting from these salts a part of their base, with which it forms acid urates. Litmus paper is reddened by its moist crystals, or by a hot aqueous solution. The acid is not volatile, and by dry distillation is decomposed into carbonate of ammonia, urea, cyanuric acid, hydrocyanic acid, etc. Uric acid acts as a very weak dibasic acid, forming with bases two series of salts, the neutral and the acid, of which the former are the more soluble. Among the most important are the acid urates of sodium, potassium, lithium, and ammonium. The urate of lithium is more soluble than any other urate, and hence lithia water is used as a therapeutic agent in converting uric acid and the more insoluble urates into a soluble salt in the living body. The urates are sometimes called lithates, and the acid itself lithic acid.

Uric acid is widely distributed throughout the animal organism. It occurs not only in the urine of man (in which it was discovered by Scheele in 1776) and carnivorous animals, but is the chief constituent (either free or in combination) of many calculi occurring in the kidneys or bladder, and of numerous urinary sediments. The urinary secretion of birds and reptiles consists almost entirely of urates, which are also found in the excrements of caterpillars, butterflies, beetles, etc., and of many mollusks. Moreover, in very minute quantities, it occurs as a urate in healthy blood, in which fluid it has been found in excess in gout and in Bright's disease, and is a constituent of the aqueous extract of the spleen, liver, lungs, pancreas, and brain. The chalk stones which occur about the smaller joints and in the lobes of the ear of many gouty patients consist mainly of sodium urate.

The best mode of obtaining uric acid is from guano, or from the excrements of snakes or fowls, which consist largely of urates. For this purpose the mass is boiled with potash, which expels any ammonia that is present, and a stream of carbonic acid is then passed through the strained potash solution, which throws down acid urate of potash. This precipitate is dissolved in water, and decomposed by hydrochloric acid, which throws down the uric acid in minute crystals.

To prove the presence of uric acid, tests of a chemical nature must be applied. The so-called murexid reaction constitutes an excellent test: the substance submitted for examination is treated with a little strong nitric acid, and the mixture is evaporated to dryness at a gentle heat; the residue is moistened with a trace of ammonia, which, if uric acid was present in the original substance, produces a brilliant purple coloration; a drop of caustic soda changes the color to a reddish blue that disappears on warming the solution. The test is based on the fact that warming with nitric acid converts urea into purpuric acid, the acid

ammonium salt of which—called murexid—has a brilliant reddish-purple color.

Uric acid and urea (q.v.) are chemically closely related to each other. In mammals nitrogenous substances are disintegrated mainly into urea; in birds the main product of disintegration is uric acid. The formation of both urea and uric acid takes place most probably in the liver.

The products of decomposition of uric acid were first thoroughly investigated, in a series of celebrated researches, by Liebig and Wöhler. Then the chemical relationship of urea and uric acid was clearly established. It has since been shown that uric acid is a diureide, i.e., a substitution product containing two molecules of urea. After much painstaking research, it was possible to demonstrate the true chemical constitution of uric acid, and finally Horbaczewsky succeeded in preparing this important organic substance by a synthetic method; Behrend and Roosen subsequently discovered another synthesis of uric acid, which is relatively simple and perfectly well understood in the light of our knowledge of the constitution of the acid, which is represented by the following structural formula, first proposed by Medicus:

Consult Alexander Haig, *Causation of Disease by Uric Acid* (7th ed., Philadelphia, 1908), and G. A. Gilbert, *Textbook on Uric Acid and its Congeners* (Danbury, Conn., 1907). See Plate of MICROSCOPY, CLINICAL.

URIC-ACID DIATHESIS. See LITHIC-ACID DIATHESIS.

URICO'NIUM, or **VIR'ICO'NIUM**. An ancient Roman city of Britain, the site of which is about 4 miles to the east of Shrewsbury, and partly occupied by the village of Wroxeter. It is mentioned by Ptolemy as existing in the beginning of the second century of our era, and it is probable that there was a Roman station here before 70 A.D. The traces of the ancient wall show that it had a circumference of about 3 miles, and through it ran the great Roman road now known as Watling Street (q.v.). Exploration of the remains began in 1859. On the north side of the old wall was probably the Basilica, and on the south the public baths. A few inscriptions and numerous small objects, such as coins, brooches, hairpins, pottery, sculptures, etc., found in the ruins are in the museum at Shrewsbury, and some of the buildings excavated have since been covered. The human remains found in the excavations show that the city was sacked and burned by enemies, probably the West Saxons, in the sixth century. Of this, however, there is no historic record. The ruins seem to have remained with little change, except the gradual process of decay, till about the twelfth century, when they were used as material for other buildings. Consult J. C. Anderson, *The Roman City of Uriconium at Wroxeter* (London, 1867), and the *Classical Weekly*, vol. vii (New York, 1913).

U'RIEL (Heb. *Uri'el*, light of God). One of the seven archangels, who personified light and had his dwelling in the sun. He appears in

Milton's *Paradise Lost* and Longfellow's *Golden Legend*.

U'RIM AND THUMMIM (Heb. *urim wethummim*). The name given to two objects, perhaps pebbles or stones in the shape of dice, kept in the oracle pouch that hung upon the breast of the Jewish high priest (Ex. xxviii. 30; see EPHOD). They were used to obtain an oracular decision revealing the divine will. While we do not know the precise manner in which this decision was obtained, analogy from similar customs among ancient nations makes it probable that the stones were drawn by lot out of the pouch, and, according to the one drawn, an affirmative or negative answer to a question was given. An entirely satisfactory explanation of the two mysterious names has not yet been furnished, but all the evidence points in favor of a connection with two Babylonian words *urtu*, decision (used chiefly of oracular decisions), and *tamitu*, oracle, which occur in the religious literature of Babylonia. The two words would thus be almost synonymous, and this view is supported by the consideration that they are so used in the Old Testament (e.g., Deut. xxxiii. 8, according to the Greek text), and that Urim at times is used without Thummim (e.g., Num. xxvii. 21 and 1 Sam. xxviii. 6), which shows that the one word conveyed the idea without the help of the other. It is noticeable that Urim begins with the first, Thummim with the last letter of the alphabet. The early explanations, such as "light and perfection" or "light and truth" (Luther's view), are generally rejected as purely fanciful by critical scholars, who hold that the use of the Urim and Thummim belongs to the realm of primitive religious rites, and that its persistence to a late period is due to the strong hold that it had taken upon the Hebrews. In Deut. xxxiii. 8 there seems to be a suggestion that Urim and Thummim originally were in Yahwe's possession but were wrested from him by Moses. It should be added, however, that the notice in Ex. xxviii. 30, where the Urim and Thummim are described as a part of the high priest's costume, without reference to their practical use, marks the transition to the symbolical view, taken in the later Jewish theology, of their significance as tokens of the revelation and guidance granted to Israel through its representative, Aaron. Consult: articles in the *Encyclopædia Biblica* (4 vols., New York, 1899-1903), and Hastings, *Dictionary of the Bible* (1 vol., ib., 1909); also Muss-Arnolt, "The Urim and Thummim," in the *American Journal of Semitic Languages*, vol. xvi (Chicago, 1900); Eduard Meyer, *Die Israeliten und ihre Nachbarstämme* (Halle, 1906); Hugo Gressmann, in *Die Religion in Geschichte und Gegenwart* (Tübingen, 1913).

URINE (Lat. *urina*, urine; connected with Gk. *ούρον*, *ouron*, urine, Skt. *vāri*, *vār*, water, Av. *vāra*, rain, Icel. *úr*, drizzling rain, AS. *wer*, sea). The fluid which is secreted by the kidneys, stored in the bladder, and evacuated through the urethra in the act of urination. The epithelium lining the tubules of the kidneys elaborates from the blood urea and other products of retrograde metamorphosis, and a transudation or osmosis of water occurs from the interior of the convoluted blood vessels into the cavity of the tubules.

In a healthy human being urine is a clear yellowish or amber fluid of a salty taste and a peculiar aromatic odor, normally acid, and with

a specific gravity of about 1.020, and generally containing some mucus. In 24 hours such a person discharges about 50 fluid ounces, or 1500 cubic centimeters, of urine. The amounts of the several urinary constituents passed in 24 hours are approximately as follows:

	Grams
Water.....	1500.000
Total solids.....	72.000
Urea.....	33.180
Uric acid.....	0.555
Hippuric acid.....	0.400
Kreatinin.....	0.910
Pigment and other substances.....	10.000
Sulphuric acid.....	2.012
Phosphoric acid.....	3.164
Chlorine.....	7.000
Ammonia.....	0.770
Potassium.....	2.500
Sodium.....	11.090
Calcium.....	0.260
Magnesium.....	0.207

These constituents, other than water, appear in the urine as: (1) inorganic salts, including sodium chloride; calcium chloride; potassium and sodium sulphates; sodium, calcium, and magnesium phosphates; traces of silicates; alkaline carbonates; nitrates in small quantity; traces of iron. (2) Nitrogenous crystalline bodies, including urea, uric acid, kreatinin, xanthin, hypoxanthin, and occasionally allantoin; hippuric acid, ammonium oxalate; and rarely taurin, cystin, leucin, and tyrosin. (3) Nonnitrogenous bodies, including lactic, succinic, formic, oxalic, and phenylic acids; and rarely sugar in minute amount. (4) Pigments, including urobilin, purpurin, and indican. (5) Other bodies, including ferments from the various digestive fluids of the body. (6) Gases, rarely, in very small quantities, chiefly nitrogen and carbonic acid.

The acidity of normal urine is due to the presence of the acid sodium biphosphate. At times the urine of digestion is alkaline, and frequently urine decomposes rapidly and becomes alkaline. Upon standing and cooling, it frequently becomes cloudy from the urates, and a sediment of pink urates occurs; or in other cases an increase of oxalate of ammonium, together with mucus, forms a thick precipitate or deposit. This occurrence by no means indicates disease of the kidneys, as the laity are apt to imagine. Among the abnormal constituents of urine are blood, pus, epithelium from bladder, kidney, ureter, or vagina, spermatozon, albumin, fibrin in the form of casts, fats, sugar, etc., during various conditions or diseases. In Bright's disease (q.v.) albumin and casts are generally found.

Urea is determined most easily by a test with hypobromate of potassium. The total excretion each day should be between 300 and 600 grains. Uric acid generally precipitates in a few days if the urine be allowed to stand. Sugar is generally detected by using a solution of sulphate of copper, which is reduced and precipitated in the form of the orange-colored oxide in the presence of glucose. Albumin responds to boiling or the nitric-acid test, either of which causes a permanent cloud in the urine if albumin be present. Phosphates cause a white cloud on boiling the urine, which is dissolved and cleared away by adding a drop of acetic acid. Chlorides, ammonia, and urates have their special chemical tests.

Urinary Deposits are of rare beauty and interest under the microscope. Besides blood, pus, and epithelial cells occurring during grave

illness, several crystals are found in ordinary urine with slight variations in health. After standing for a time at a moderate temperature, amorphous granular matter precipitates in most specimens of urine, soluble by heat, and composed of the urates of calcium and magnesium with the acid urates of potassium, sodium, and ammonium. These deposits are probably caused by the excess of phosphoric acid furnished by the acid sodium biphosphate, which decomposes the alkaline urates. After a longer period, from a few days to two weeks, alkaline fermentation supervenes, due to the presence of yeast fungus and mucus. During this process urea is converted into carbonate of ammonium. As this fermentation begins, the uric-acid crystals, occurring as red pepper dust in the receptacle, begin to dissolve, while adhering to their fragments we find prismatic crystals of urate of sodium and spheroids of urate of ammonium. When the alkalinity of the urine is established amorphous granules of phosphate of lime appear, together with triangular prisms of triple phosphates of ammonium and magnesium, and octahedral crystals of oxalate of calcium.

These changes may progress in the pelvis of the kidney or in the bladder. Uric-acid gravel or calculus is found in either situation, causing much pain and a grave pathological condition, as the changes in the mucous membrane lining either cavity are important. (See CALCULUS.) Uric acid or urate calculi are generally red and quite hard. Oxalate calculi are usually found, when present, in the pelvis of the kidney, and are of such shape and color as to be called mulberry calculi. Phosphatic calculi are white and soft, and often appear as dust. Calcium carbonate, cystin, and xanthin calculi are rare. Calculi may be prevented, and probably phosphatic calculi may be dissolved in the bladder by the use of alkaline waters, lithia waters, or salicylates. They cause severe inflammatory conditions in most cases. See INDICAN; LITHIC-ACID DIATHESIS; MICROSCOPY, CLINICAL; PHOSPHATIC DIATHESIS. Consult E. C. Simon, *A Manual of Clinical Diagnosis* (8th ed., Philadelphia, 1914).

URINE, INCONTINENCE OF, or ENURESIS. A common affection in childhood but sometimes occurring in advanced life. The child discharges its urine in bed during sleep. The habit may often be broken by proper domestic management, as withholding any excess of fluids before going to bed, by waking it and making it empty the bladder late at night. The most certain medicinal remedy is belladonna. But many different sources of irritation may be operative, and these must be sought for and eliminated. Among the more common are worms, enlarged tonsils, and adenoid growths (which produce a semiasphyxiated condition during sleep), and phimosis. Enuresis is seen in some cases of cerebral or spinal disease, when it is of a different nature. In these patients the bladder becomes filled, and subsequently formed urine dribbles away, owing to a failure in the nerve mechanism to cause contraction of the muscle fibres in the wall of the viscus.

URINE, RETENTION OF. See RETENTION OF URINE; STRANGURY.

URIU, 宇利-烏, SOTOKICHI, BARON (1857-). A Japanese admiral, born in Ishikawa. He graduated from a Japanese naval academy, and in 1881 from the United States Naval Academy at Annapolis. Afterward he

was promoted through the various grades to captain (1892), rear admiral (1900), and vice admiral (1904) in the Japanese navy. During the China-Japan War he was naval attaché at Paris. Later he served as captain of the *Matsushima*, and then of the *Yashima*. During the Russo-Japanese War he commanded the Second squadron, blockaded the port of Chemulpo, and there sank the Russian cruisers *Variag* and *Kortez*. For his war services he was decorated with the first class of the Rising Sun and the second class of the Golden Kite in 1906, and created Baron in 1907.

URIYA (or **ORRYĀ**) **LANGUAGE AND LITERATURE** (Skt. *Odra, Utkali*). The language and literature of Orissa (q.v.), in Bengal, spoken by about 9,000,000 persons. Together with Bengali (q.v.), Bihari (q.v.), and Assamese (see ASSAM), it forms the eastern group of the Indo-Aryan family of languages. Like the other modern Aryan languages of India, it is analytic in structure. In grammatical construction Uriya is related to Bengali, although it resembles Hindi. (See **HINDUSTANI LANGUAGE AND LITERATURE**.) Its resemblance to Bengali consists in the fact that the plural is signified by a noun meaning multitude, and that the first and second persons singular of the verb are used only by the uneducated. But it differs from Bengali in that its spelling is much more phonetic, and that it possesses a very complete set of verbal nouns, present, past, and future. In grammatical development as well as vocabulary Uriya is very archaic and can only be compared to Vedic. The vocabulary, however, is largely composed of Sanskrit loan words, of which Uriya possesses more than any other of its kindred languages. The standard dialect is that of Cuttack. The script, which is derived from the Devanagari (q.v.), is noteworthy among the North Indian alphabets in that it is characterized by curves instead of angles. Uriya literature, which is rather scanty, cannot be traced beyond the sixteenth century. It begins with Upendra-Bhanja, the author of more than 30 poems, most of them religious or erotic, although he also wrote two dictionaries. Contemporary with him was Dina-Krushna Dasa, who composed the most famous Uriya poem, the obscene *Rasakallōla* (edited at Cuttack, 1897). Most of the literature, however, consists of translations or paraphrases of Sanskrit works, such as the *Rāmāyana* (q.v.), the *Bhagavadgītā* (q.v.), and some of the *Purāṇas* (q.v.), while in later times the tendency has been to translate or adapt Bengali and English books. Its modern prose works are, therefore, of rather doubtful value.

URLICHS, ūr'liks, **LUDWIG VON** (1813-89). A German classical scholar, born in Osnabrück and educated at Bonn. He taught at Bonn from

1844 to 1847, was then called to Greifswald and in 1855 to Würzburg. He wrote on the history of art, *Skopas' Leben und Werke* (1863), *Die Anfänge der griechischen Künstlergeschichte* (1871-72), and *Beiträge zur Kunstgeschichte* (1885); and on Tacitus and Pliny. His "Grundlegung und Geschichte der klassischen Altertumswissenschaft" (1886; 2d ed., 1892), in Iwan Müller's *Handbuch der klassischen Altertumswissenschaft*, is his most important work in classical philology.

URLUS, ūr'lus, **JACQUES** (1873-). A German dramatic tenor, born at Hergenrath, near Aix-la-Chapelle. He began his musical studies at Utrecht, and continued them at Amsterdam under Averkamp and Nolthenius and at the conservatory. His début took place in 1894 at the Opera in Amsterdam, where he remained for six years. Engaged for the Leipzig Opera, in 1900, he created so deep an impression there that he was asked to participate in the Wagner festivals at Bayreuth and Munich. His superb interpretation of the great Wagner rôles secured him many guest appearances at Berlin, Vienna, Paris, Amsterdam, and Brussels. In 1912, when he made his American début at Boston as Tristan, he won instant success, and from 1913 he was a regular member of the Metropolitan Opera House. His beautiful singing and noble acting established him as an operatic favorite.

URMIA, ūr-mē'ā. A lake and city of Persia. See **URUMIAH**.

UROCHORDA, ū'rō-kōr'dā (Neo-Lat. nom. pl., from Gk. *ὐρά*, *oura*, tail + *χορδή*, *chordē*, chord). A class of chordate animals, the ascidians (q.v.).

URODELA (Neo-Lat. nom. pl., from Gk. *ὐρά*, *oura*, tail + *ῥήλος*, *rhēlos*, manifest). An order of the Amphibia which comprises the tailed amphibians, or amphiumes, salamanders, and mud puppies (qq.v.), in which both fore and hind limbs are always present, and which have teeth in both jaws; and the sirens, in which the hind limbs, maxillary bones, teeth, and eyelids are absent. This order is confined to the north temperate zone, except a few forms that extend along the highlands into Venezuela. About 100 species in four families constitute the entire list. These families are the Salamandridæ, Amphiermidæ, Proteidæ, and Sirenidæ. The geological origin of the group is uncertain; representatives are numerous in the Lower Tertiary strata; and a single Mesozoic specimen is known. Consult Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901), and E. G. Boulanger, *Reptiles and Batrachians* (New York, 1914).

UROTROPIN. One of several trade names of a formaldehyde derivative called hexamethylenamin, having the formula $C_6H_{12}N_4$. It is produced by the action of formaldehyde on ammonia and is a valuable internal antiseptic, particularly on the urinary organs, being decomposed in the tissues, the formaldehyde being set free and excreted by the kidneys. If urotropin is given in sufficiently large doses formaldehyde can be detected in the cerebrospinal fluid and other secretions of the body. The indications for its use are, therefore, infections of the kidneys, bladder, and urethra, such as pyelitis, cystitis, and urethritis. It is also advocated as a prophylactic against meningitis and scarlatinal nephritis, and is of value in diarrhœa and as a solvent of uric acid. In cases of early cerebro-

spinal meningitis it may be injected directly into the spinal canal. Certain individuals have an idiosyncrasy against the drug, and in them symptoms of severe renal irritation may arise. Other trade names of hexamethylenamin are cystogen, formin, aminoform, and uritone.

URQUHART, ər'kərt, DAVID (1805-77). A British diplomat and political writer. He was born in Scotland, and was educated at St. John's College, Oxford. He took part in the Greek war of independence. In 1835-36 he was Secretary of the British Embassy at Constantinople. Because of opposition to the Eastern policy of Lord Palmerston, whom he suspected of collusion with the Czar, he resigned his position. After traveling in all parts of the East to obtain further information respecting the commercial and political influence of Russia, he returned to England, and both in his writings and in Parliament (1847-52) openly charged the Palmerston ministry with betrayal of British interests. His publications include: *Turkey and Its Resources* (1833); *The Spirit of the East* (1838); *The Mystery of the Danube* (1844); *Letters and Essays on Russian Aggressions* (1853); and other books bearing on the Eastern Question.

URQUHART, or **URCHARD**, SIR THOMAS (1611-60). An English author. He belonged to an ancient family of Cromarty in Scotland. He was educated at King's College, Aberdeen, and traveled in France, Spain, and Italy. He was on the Royalist side in the Revolution; was knighted by Charles I in 1641; and fought at the battle of Worcester. He was taken prisoner and was imprisoned in the Tower and then in Windsor Castle, but was soon released on parole. Of his last years little is known. He is said to have died abroad in an uncontrollable fit of laughter on the restoration of Charles II. He is still known for his excellent translation of Rabelais (two books of *Gargantua* in two vols., 1653; reissued, with a third translated book by Urquhart and with the rest rendered by P. A. Motteux in Bohn's Library, London, 1897, and in *Tudor Translations Series*, London, 1899). Of great interest is his poem *The Jewel*, in which is described a universal language (1652), a kind of forbear of Volapük, which he himself had concocted. In his *Promptuary of Time* (1652) he traced his family back to the red earth from which God created Adam. He also published *Epigrams, Divine and Moral* (1641); *The Trissotetras; or a most Exquisite Table for Resolving all Manner of Triangles* (1645); and other curious books.

URQUIZA, ər-ke'thə, JUSTO JOSÉ (1800-70). An Argentine soldier and politician, born at Arroyo de la China, Entre Ríos. He was educated by the Jesuits and attained great prominence in his native province as an adherent of the Federal party. In 1844-45 he fought with sanguinary distinction in Uruguay. He was early a supporter of J. M. Rosas (q.v.), and in 1846 was elected Governor of Entre Ríos. When Rosas tried to destroy the autonomy of the Argentine states Urquiza revolted, formed an alliance with Brazil and Uruguay, and, entering the latter country in June, forced Oribe, the general of Rosas, to capitulate. Urquiza then crossed into Buenos Aires, and at Monte Caseros, Feb. 3, 1852, defeated Rosas, who was compelled to flee. After the formation of the new constitution in 1853 he was elected President of the Argentine Confederation, which in-

cluded all the states excepting Buenos Aires, and by his victory at Cepeda, Oct. 23, 1859, forced that state, too, to lend its adhesion. His term of office ended in the same year. Soon afterward Buenos Aires revolted, and Urquiza, at the head of the forces of the confederation, was defeated by Gen. Bartolomé Mitre (q.v.) at Pavón, Sept. 17, 1861. Urquiza was later again Governor of Entre Ríos and served as general in the early part of the Paraguayan War. He was assassinated by political enemies on his estate at San José, near Concepción.

UR/SA MA'JOR (Lat., greater bear) AND **UR/SA MI'NOR** (Lat., lesser bear). Two celebrated constellations in the Northern Hemisphere of the heavens. Ursa Major was distinguished as early as the time of Homer by the names *Arktos*, the Bear, and *Hamaxa*, the Wagon. The Roman name *Ursa* was a translation of the Greek *Arktos*; the Romans also called the seven bright stars the *Septentriones*, the seven plowing oxen. The common names throughout Europe for these seven stars are the Plow, Charles's Wain, the Wagon, evidently derived from the classical epithets above mentioned; in America they are called the Dipper, from the resemblance to that utensil. This remarkable group of stars, being within 40° of the North Pole, never sinks below the horizon in northern latitudes higher than 40°. The constellation contains a considerable number of stars visible to the naked eye; there is, however, none of the first magnitude, but at least 16 are of the third magnitude or brighter. Of the seven stars constituting the Dipper, six, viz., α , β , γ , ϵ , ζ , and η , are of second magnitude, while the seventh, δ , is of the third magnitude; α and β are known as the Pointers, because a line drawn through them points directly at the polestar (q.v.). ζ Ursa Majoris, or Mizar, was the first star to be recognized as double, its two components, of magnitudes 2.4 and 4 respectively, being separated by about 14.6"; in 1889 Pickering found that the brighter component was itself a spectroscopic binary.

Ursa Minor is less prominent in the heavens. The star α in the extremity of the tail of the Little Bear, at present the polestar (q.v.), is the brightest in the constellation, though only of the second magnitude.

URSEREN, ər'ze-ren. See ANDERMATT.

UR/SIDÆ. The family of the bears (q.v.).

URSINUS, Ger. pron. ər-sē'nus (Latinized form of his German name Bär), ZACHARIAS (1534-83). A Reformed church theologian. He was born at Breslau, and studied at Wittenberg under Melancthon, at Geneva under Calvin, and at Paris. He became professor at Heidelberg (1561) and teacher at Neustadt-on-the-Hardt in 1578. With Olevianus he drew up the Heidelberg Catechism, and wrote in its defense. His collected works appeared at Heidelberg in 3 vols. (1612 et seq.). Consult Sudhoff, *Olevianus und Ursinus* (Elberfeld, 1857).

URSO, ər'sō, CAMILLA (1842-1902). A French violinist, born at Nantes, France. She studied with Massart in Paris, and, about 1852, played in New York, Boston, Philadelphia, and other American cities. She was exceedingly successful, especially in concerts with Alboni and Sontag. She returned to France after having toured Canada, and in 1866 again visited New York. Subsequently she made tours of Australia and South Africa. After 1895 she lived in New York.

URSUA, *ūr-sū'a*, or **ORSUA**, PEDRO (c.1510-61). A Spanish soldier and explorer, born in Ursua, near Pamplona, Navarre. About 1544 he went to New Granada, where he became Governor in 1545, and in 1547 and again in 1549 marched to the northeast in search of Eldorado, making several settlements, among them Pamplona. In 1559 he was sent by the Viceroy of Peru to search again for Eldorado or the Kingdom of the Omaguas, on the Peruvian tributaries of the Amazon. This expedition seems to have been sent in order to rid Peru of the many soldiers of fortune, who were eager to enlist. One of them, Lope de Aguirre (q.v.), after the expedition had sailed down the Huallaga, formed a conspiracy, the outcome of which was the assassination of Ursua.

URSULA, SAINT. A saint and martyr of the Roman Catholic church. She is held in especial reverence at Cologne, the reputed place of her martyrdom. October 21 is her day in the church's calendar, and the date of her martyrdom is variously given as 237, 283, and 451. The official date, however, is 237.

The legend appears in various forms, but the common element seems to be that Ursula was the daughter of a British King, and that her hand was asked by another King for his son, who threatened to lay waste the land if he were refused. But Ursula had been vowed to virginity. At last she succeeded in gaining three years' delay, during which time she was to visit various holy places in company with 11,000 virgins. They took ship and sailed up the Rhine to Basel, and thence went to Rome on foot. They returned and sailed down the Rhine again as far as Cologne, where they were massacred one and all by the Huns. They were buried by the inhabitants of Cologne with great honors, and a church was built over their remains.

The legend is entirely unknown to Jerome, Bede, Rabanus Maurus, and Gregory of Tours, though the latter gives a detailed description of the church. The earliest traces of the legend appear in the ninth century, and in the succeeding centuries, references to it become common. Great interest was excited in the twelfth century by the discovery of an old Roman cemetery in Cologne, whose bones were thought to be those of the slaughtered virgins. The vision of an ecstatic nun, St. Elizabeth of Schönau, and of a monk, Hermann Joseph, purported to reconstruct forgotten details of the voyage and death of the martyrs and thus added considerably to the legend.

The controversy over this legend has continued for many hundred years. The conservative element in the Roman Catholic church considers it probable that there was at one time a massacre of virgins at Cologne by the Huns, but that the details of the story as given at the present time are mediæval fabrications. The rationalists outside of the church follow Schade's theory that the story of Ursula is only a Christianizing of an old German myth, and that Ursula is really Freya, called in Swabia Hörsel, or Ursul, with the same attributes as the moon divinities in other lands.

Consult: Crompton, *Vita et Martyrium Sanctæ Ursulæ et Sociarum* (Cologne, 1547); Schade, *Die Sage von der heiligen Ursule und den elftausend Jungfrauen* (Hanover, 1854); G. F. Tout, "Legend of St. Ursula," in *Historical Essays*, by various authors (London, 1902). For

controversial replies to Schade: De Buck, *Acta Sanctorum* (Brussels, 1858); Kessel, *Ursula und ihre Gesellschaft* (Cologne, 1863).

URSULINES. A religious order for women in the Roman Catholic church, founded for the education of girls. It takes its origin from St. Angela Merici (q.v.). A rule in 25 chapters was projected by Angela, and finally approved (1536) by the Bishop of Brescia, Cardinal Francis Cornaro. Angela was herself chosen as the first superior, in the year 1537, the community even at that time numbering as many as 76 sisters. In the year 1565 a house was opened at Cremona; and with the approval of Popes Gregory XIII and Clement VIII, it spread over many dioceses of Italy. It was warmly encouraged by St. Charles Borromeo, and at his death there were no fewer than 18 convents of the order in his diocese, comprising above 600 nuns. Soon afterward it was established in France (1584). They were introduced into Savoy by St. Francis de Sales in 1635; and in 1639 a convent was opened in Quebec. They were introduced into Vienna, in 1660, and into Freiburg, Kitzingen, and Prague soon afterward, where they have continued to teach with great success. They now number 300 convents and 7000 nuns and are found in all parts of the world. The Ursuline Sisters have several educational establishments in Ireland, in England, Scotland, Canada, and in 1916 had 24 in the United States, with 1665 sisters and more than 15,000 pupils. Consult: Sainte-Foi, *Annales de l'ordre de Sainte Ursule* (Clermont-Ferrand, 1858); *Les Ursulines de Québec* (Quebec, 1868); *Glimpses of the Monastery* (ib., 1897); Pohel, *Histoire de Sainte Angele Merici et de tout l'ordre des Ursulines* (Paris, 1878).

URTICA/CEÆ (Neo-Lat. nom. pl., from Lat. *urtica*, nettle, from *urere*, Skt. *us*, to burn). A dicotyledonous family known as the nettle family, comprising about 40 genera and 550 species of wide geographic distribution, and chiefly herbs. The representative genera in the North American flora are *Urtica* (nettle), *Pilea* (richweed), *Boehmeria* (false nettle), and *Parietaria* (pellitory).

URTICARIA (Neo-Lat., from Lat. *urtica*, nettle), HIVES, or NETTLE RASH. An eruption of the skin, coming out suddenly, and consisting of firm, round, convex, or lenticular elevations of the skin, from $\frac{1}{4}$ inch to an inch in diameter, at first pink, and soon becoming white in the centre. These are called pomphi or wheals. They are scattered or closely crowded over the part affected, and are not symmetrical. In some cases the wheals are as large as an egg, this condition being termed giant urticaria. In the acute form of the disorder the wheals arise rapidly and subside in a few hours or a day at longest. In the rarer, chronic form they last longer and recur frequently. Urticaria is accompanied by intense itching.

The causes may be both local and general. Among the local causes are direct irritants such as the poison of the stinging nettle (whence the name), the stings of bees and wasps, contact with jellyfish and certain caterpillars. General or systemic causes may be the eating of shellfish, pork, sausages, mushrooms, and some fruits, such as strawberries; certain drugs, as copaiba, cubebs, quinine; the injection of antitoxin or other serums; general disorders, such as gout, indigestion, asthma, and in women pregnancy, menstruation, and lactation. Sometimes no

cause can be found except general nervous irritability. Treatment must depend on the cause, which should be sought for and removed. Acute cases, of dietetic origin, may be relieved by an emetic, if vomiting and diarrhœa do not occur spontaneously. In the chronic form, which is often very stubborn, if the urticaria can be traced to any article of food, this should be eliminated. The digestion must be regulated, and general disorders, such as gout, treated with appropriate remedies. For the severe itching and burning, alkaline baths or lotions, or mild solutions of carbolic acid or other antiseptics, may be used locally. Scratching must be avoided, since it only aggravates the affection. The pharynx or larynx may be the seat of urticaria and produce alarming attacks of suffocation.

URUBITINGA (from Braz. *urubu*, vulture + *Tupi tinga*, white, beautiful). A large hawk of the genus *Urubitinga*, several species of which exist in tropical America. All have bluish black plumage, marked with white on the rump and tail. One species, the Mexican black hawk (*Urubitinga anthracina*), may be found in Arizona. These hawks nest in large trees, and lay white eggs.

URUGUAY, ú'ru-gwā or ō'rōō-gwī'. A river of South America, rising on the west slope of the Brazilian coast range, and emptying into the Plata estuary (Map: America, South, D 5). Its total length is about 1000 miles. The greater part of its course lies on the plateau, and the upper portion, known as the Pelotas, passes through a densely forested wilderness. The banks are generally high as far as Salto, 200 miles from the mouth of the river, and at that point navigation is obstructed by a series of rocky reefs and rapids, which become falls at low water. Below Salto the land on the west bank is low and level, and periodically inundated. The Uruguay here connects by lateral branches with the Paraná. For the last 100 miles the river is very broad, and really forms the head of the Plata estuary, though the name Uruguay is continued to the Paraná confluence. The river is navigable for large sea-going vessels to Paysandú, about 150 miles, and for smaller vessels to Salto, while barges navigate the stream 300 miles above the rapids.

URUGUAY, officially REPÚBLICA ORIENTAL DEL URUGUAY. The smallest of the South American republics, bounded on the north and east by Brazil, on the east and south by the Atlantic Ocean, on the south and west by Argentina, from which it is separated by the Uruguay and La Plata rivers. Its area is calculated at 72,168 square miles.

Topography and Minerals. The most elevated portions of Uruguay lie in the north and northwest, where a few sharp ridges attain a height of nearly 2000 feet. Along the Uruguay River are found table-lands of moderate elevation, resembling the neighboring pampas of Argentina, though higher. The southeastern coast portion is low and marshy, with sandy stretches bordering the ocean, while the interior is composed of rolling plains diversified in the north and northwest by low ridges of hills. Here extensive forest regions also occur, especially near the rivers, while the southeastern portion is largely covered with grass. The hills rest upon an old crystalline foundation of gneiss and granite, with some sandstone, Tertiary and ancient eruptive rocks, and possibly Paleozoic strata.

The maritime and river coast of Uruguay from Chuy to Santa Rosa is 685 miles long. After the Río de la Plata and the Uruguay the Río Negro, wholly within the Republic, is the most important river and for a portion of its course is navigable for small craft. But little advantage has been taken of the mineral wealth, though it is certain that silver, copper, magnesium, iron, zinc, lead, gypsum, sulphur, asbestos, antimony, and coal exist. Gold mines are worked in the northern departments. Precious stones, including diamonds, rubies, jasper, agate, amethyst, and topaz, are found. Marble and other building-stone quarries are in operation.

Climate, Flora, and Fauna. The almost peninsular position of Uruguay gives it a delightful climate, with temperature ranging from 32° to 88° F. Occasionally in the lowlands the temperature rises to 100° F. in February, while frosts are common in the upland regions, where occasional snows also occur at long intervals. Rains are plentiful throughout the year, but the greatest precipitation occurs in May and in October. During the winter months cold storms, known as pamperos, blow from the southwest. In its flora and fauna Uruguay in the northern part resembles southern Brazil and in the southern part its neighbor Argentina. See ARGENTINA; BRAZIL.

Industries. During recent years there has been a steady advance in agricultural production. Public companies facilitate the purchase of land by settlers. Up to 1880 most of the breadstuffs were imported, but since 1885 corn and wheat have become important articles of export. The grazing industries of Uruguay are, however, the chief reliance of the inhabitants. The results of the live-stock census of 1908 were as follows: cattle, 8,102,602; milch cows, 565,854; horses, 566,307; mules, 17,671; asses, 4428; sheep, 26,286,296; goats, 19,951; swine, 180,099; ostriches, 242,872. The increase in the number of cattle between 1900 and 1908 was 20 per cent and of sheep 41.3 per cent. In 1908 the cultivated area was 794,136 hectares; since that date it has probably increased considerably, 1,000,000 hectares being stated unofficially in 1915. Natural meadows and pastures amounted to 15,278,374 hectares in 1908, and woodlands to 433,673 hectares. The following table shows the area in hectares under leading crops in the year 1914-15, with the average area in the period 1910-11 to 1914-15, and the production in metric quintals in 1914-15, with the average production in 1910-11 to 1914-15; the last column shows the average yield per hectare in the period 1910-11 to 1914-15.

CROP	HECTARES		QUINTALS		Qs. ha.
	1914-15	Average	1914-15	Average	
Wheat.....	315,000	309,000	930,000	1,605,452	5.1
Oats.....	33,531	27,951	150,890	179,318	6.5
Corn.....	345,000	204,145	2,920,000	1,807,741	6.1
Barley.....	1,782	2,465	8,019	15,352	5.9
Linseed.....	40,000	48,664	140,000	221,234	5.8
Tobacco.....	1,224	10,037	8.2
Vines.....	18,500	10,589	*152,934	..

* Hectoliters of wine.

Other crops of importance are potatoes, sweet potatoes, beans, fruits, and olives. The chief manufacture is flour. There are saladeros for

the production of jerked and salted meats for foreign shipment.

Transportation and Commerce. There were reported, for 1914, 1601 miles of railway in operation and 165 miles under construction. The rivers are largely utilized for inland communication, and in addition there are some 2250 miles of national highways and 3100 miles of departmental roads and paths for local traffic. In 1912 the merchant marine included 46 steamers, of 29,962 tons net, and 165 sail, of 27,798 tons net. Montevideo is the chief port and one of the best on the coast. The value of the special foreign trade in merchandise has been as follows, in thousands of pesos gold:

	1907	1909	1910	1911	1912	1913
Imports...	37,471	37,157	40,814	44,798	49,380	52,600
Exports...	34,912	45,109	41,023	44,537	53,042	67,600

The leading imports include foodstuffs, textiles, machinery, ironware, and jute; the exports, preserved meats, hides and horns, tallow, cattle, beef extracts, and agricultural products.

Government. The constitution of Sept. 10, 1829, was published July 18, 1830. The legislative power is vested in the General Assembly, or Congress, consisting of the Senate and the House of Representatives. Senators, 19 in number (one for each department), are elected for six years by indirect vote. Representatives, 90 in number, are elected for three years by direct vote. The executive power is vested in the President, elected for four years by a majority vote of the Senate and House of Representatives in joint session. The President is not eligible for the next succeeding term. He is assisted by a responsible minority of seven members. Each territorial department is administered by an executive, appointed by the President, and a council elected by direct vote. The judiciary is composed of a supreme court, two courts of appeal, and a number of lower courts. Justices of the supreme court are elected by the General Assembly; judges of other courts are appointed by the supreme court. The capital of the Republic is Montevideo (q.v.).

Finance. The standard of value is gold, and the monetary unit is the peso, whose par value is \$1.03424. For the fiscal year 1914 the estimated revenue and expenditure were 36,597,360 and 36,516,877 pesos respectively. For the same year customs revenue was estimated at 17,600,000 pesos. Public debt, Dec. 31, 1913: foreign consolidated, 118,487,935 pesos; international, 2,190,500; internal, 15,620,423; total, 136,298,858. Service of the debt in 1913 was 5,366,733 pesos; in addition redemptions amounted to 2,514,013 pesos. The Bank of the Republic, established in 1896, had a nominal capital in 1911 of 20,000,000 pesos; the paid-up capital at the end of 1913 was 13,027,778 pesos. This bank has an exclusive right of issue. Its note circulation in January, 1915, was 23,295,886 pesos, and its stock of gold 11,647,109 pesos.

Army. The regular army is recruited by voluntary enlistment and consisted, in 1915, of 17 battalions and 4 rifle companies of infantry, 16 regiments of cavalry, 3 field artillery regiments of only 3 batteries each, 1 company of fortress artillery, 1 machine gun company, 1 sanitary company. Total peace strength about 10,500;

initial mobilization for war estimated at 50,000. Enlistment period from two to five years, with the privilege of reenlistment until the age of 44. In the militia service is compulsory between the ages of 17 and 45, as follows: first class, physically fit, between 17 and 30, numbers about 20,000, takes the field with the regular army in war; second class, physically fit, between 30 and 45, recruited and serving in territorial departments, but available to supply vacancies created in field forces in war; third class, all other men between 19 and 45, not included in first two classes, liable for local home defense only. Total strength of three classes estimated at 170,000 men. For navy, see NAVIES.

Population. By departments the area and the population, according to the census of Oct. 12, 1908, and an estimate of Dec. 31, 1913, are shown in the following table:

DEPARTMENT	Sq. m.	Pop., 1908	Pop., 1913
Artigas.....	4,393	26,321	36,340
Canelones.....	1,835	87,874	107,088
Carro Largo.....	5,764	44,742	54,005
Colonia.....	2,194	54,644	74,458
Durazno.....	5,527	42,325	51,787
Flores.....	1,745	16,082	21,562
Florida.....	4,675	45,406	56,917
Maldonado.....	1,587	28,820	37,125
Minas.....	4,820	51,222	62,920
Montevideo.....	256	309,231	364,343
Paysandú.....	5,115	38,421	60,512
Río Negro.....	3,270	19,932	33,529
Rivera.....	3,795	35,683	43,342
Rocha.....	4,281	34,119	43,309
Salto.....	4,865	46,259	66,493
San José.....	2,688	46,325	57,011
Soriano.....	3,561	39,565	51,413
Tacuarembó.....	8,114	46,939	56,438
Treinta y Tres.....	3,683	28,777	37,192
Total.....	72,168	1,042,686	1,315,714

Of the total at the 1908 census, 861,464 (82.62 per cent) were natives, and 180,722 (17.38 per cent) foreigners. The foreigners included 62,357 Italians, 54,885 Brazilians, 18,000 Argentines, 8341 French, 1444 Turks and Syrians, 1406 Swiss, 1324 British, and 1112 Germans. Of the natives, 48.82 per cent were males; of the foreigners, 60.08 per cent. The only large city is Montevideo, which in 1908 had 291,465 inhabitants. The town of Paysandú had 20,953; Salto, 19,788; Mercedes, 15,667; Minas, 13,345; Melo, 12,355; San José, 12,297; Rocha, 12,200.

Education and Religion. In 1908 the population five years of age and over numbered 873,231; of these, illiterates numbered 347,491. Primary instruction is nominally compulsory. In 1913 there were 986 public schools, with an enrollment of 91,746; private schools numbered 238, with an enrollment of 21,874. There are several secondary schools and normal schools, a school of arts and trades, and a military college. At Montevideo is the University of Uruguay, which in 1910 had 112 teachers, 530 regular students, and 661 students receiving secondary instruction. Roman Catholicism is the state religion, but religious toleration prevails. In 1908, of the population 15 years of age and over, 430,095 were Roman Catholic, 12,232 Protestant, 126,425 liberal, and 45,470 other and unspecified.

History. The natives of the Banda Oriental, the region to the northeast of the Plata River, for many years prevented any exploration of the interior and in 1580 forced the garrison to abandon the only fort established in their territory,

on the San Salvador River. In 1603 a powerful Spanish force, intended to protect a colony, was defeated, and it was not until the year 1624 that the first settlement which became permanent was founded, at Santo Domingo de Soriano on the Río Negro. The Portuguese of Brazil claimed this region as a part of their territory, and their outposts crept down the coast from Rio de Janeiro, until in 1680 they established themselves at Sacramento, not far distant across the river from Buenos Aires. The local Spanish officials profited by the commerce between this city and the Portuguese, and for 50 years no very serious efforts were made to drive them away. In 1723 the Portuguese fortified the heights surrounding the Bay of Montevideo and apparently planned to enter into more active competition with Buenos Aires. This aroused the Spaniards, who promptly organized an expedition which forced the surrender of the Portuguese works at Montevideo, where a colony of families from Buenos Aires was established. Intermittent conflicts between the two claimants fill the annals of the remainder of the eighteenth century, resulting in the ultimate establishment of the Spanish rule. In 1807 the English fleet under Popham captured Montevideo, but their occupation ended with the failure of the attack on Buenos Aires. The inhabitants of Uruguay promptly joined those of Argentina in the revolt against Spain in 1810 and established an independent confederation under the Protector Artigas (q.v.); the Spaniards were driven from Montevideo in 1814. The country was weakened and demoralized by the efforts to drive out the Spaniards, and the Portuguese in Brazil, perceiving their opportunity, revived their claim to the territory. They captured Montevideo (1817) and drove Artigas into the interior, until he was forced to take refuge in Paraguay. Uruguay was annexed to Brazil as the Cisplatine State. The Uruguayan patriots established headquarters across the Río de la Plata in Buenos Aires, watching for an opportunity to revive the struggle. This came in 1825, when "Thirty-three" patriots under the leadership of Juan Antonio Lavalleja crossed La Plata from Buenos Aires to free Uruguay. The insurgents won several engagements and shut the Portuguese up in their coast strongholds. In February, 1828, the Brazilians were decisively defeated, and in August peace was concluded and the independence of Uruguay was recognized. In 1830 the República Oriental del Uruguay was organized, and for five years the country enjoyed comparative quiet under the presidency of Fructuoso Rivera. In 1835 he was succeeded by Manuel Oribe, and soon a political conflict broke out between the two, terminating in civil war. Rivera made himself the leader of the Gauchos (q.v.) constituting the great mass of the non-Indian population, while Oribe represented the interests of the great landowners. In 1838 Rivera succeeded in overthrowing Oribe, who thereupon turned for aid to Rosas (q.v.), the Dictator of Buenos Aires. With the aid of Argentina's troops Oribe repeatedly defeated his rival, but could not make himself master of Montevideo, which was besieged from 1842 to 1851. In the latter year the party of Rivera concluded an alliance with Brazil, and the State of Entre Ríos, which under Urquiza had broken away from the Argentine Confederation. Oribe was overthrown, and the party of Rivera after a short interval was restored to power. In 1854 Venancio Flores was elected President, but was

forced to resign in the following year. There ensued a period of utter disorder marked by conflicts of the Colorado and Blanco parties and close successions of elections and insurrections until in 1864 Brazil intervened to restore order and in the following year brought Flores back to power. An alliance with Brazil and Argentina was concluded in the same year, directed against the Dictator López (q.v.) of Paraguay. This war, which brought ruin upon Paraguay, terminated in 1870. Flores was assassinated early in 1868, and five years later José Ellauri was legally elected President. During his administration many public works were undertaken, and the transatlantic cable laid, with the result that the national finances became complicated.

In May, 1875, Pedro Varela became President, to be succeeded a year later by Colonel Latorre. Numerous changes, at irregular intervals, followed. President Juan Idiarte Borda, a Colorado, who was elected in 1894, was assassinated during a Blanco uprising in 1897 and was succeeded by Juan Lindolfo Cuestas, who in spite of some attempts at revolution retained power till 1903.

José Batlle y Ordóñez, who became President in 1903, had to contend with the opposition of the Blancos, but he succeeded in restoring tranquility to the Republic before the end of his term. He actively encouraged public works, higher education, and agriculture. In 1907 Claudio Williman entered the presidency. During his administration a boundary treaty was negotiated with Brazil (1907), the supreme court was organized, and a divorce law was passed (1908). A slight revolutionary disturbance occurred in 1910, owing to the candidacy of Batlle; nevertheless he was reelected and entered his second term on March 1, 1911. During this administration an eight-hour-day bill was passed, child labor was prohibited, the statistical work of the government was organized, economic and social betterment was undertaken, and afforestation and colonization were fostered. During 1914-15 the country passed through a severe financial crisis, which was partially relieved by foreign loans. President Feliciano Viera was inaugurated on March 1, 1915, and announced that he would endeavor to secure constitutional reform, practice economy in the government, create new sources of revenue, foster education, stock raising, and agriculture, and provide for labor legislation. During his first year he secured laws favoring agriculture and colonization and providing rules for prevention of accidents to workmen.

URUK (Babylonian; Heb. *Erech*). A city in ancient Babylonia on the site of modern Warka, where there are large mounds and numerous ruins. It is mentioned even in the time of Gudea of Lagash. (See **BABYLONIA**; **ERECH**.) The German excavations in 1913 revealed that the city was still flourishing in the Seleucid and Arsacid periods. It may have been involved in the revolt of Shamashshumukin (648 B.C.), since, according to Ezra iv. 9, Archevites were carried to Samaria by Asurbanipal. Consult: Loftus, *Travels and Researches in Chaldaea and Susiana, with an Account of Excavations at Warka* (London, 1857); R. Zehnfund, *Babylonien in ihren wichtigsten Ruinenstätten* (Leipzig, 1910); Eduard Meyer, *Geschichte des Altertums* (3d ed., Stuttgart, 1913).

URUMCHI, or **URUMTCHI**, u-rōm'chē. The capital of the Province of Sinkiang, in Sungaria, China, and the seat of the Chinese administration of eastern Turkestan, 320 miles east of Kulja (Map: China, E 3). It derives its strategic importance from its position on the only road leading from Sungaria to eastern Turkestan which is available for heavy artillery. The population, which is supposed to have been 200,000 at the beginning of the nineteenth century, is estimated at 30,000.

URUMIAH, ū-rōm-mē'yā, **OROOMIAH**, or **URMIA**. A city of Persian Armenia (included in the Province of Azerbaijan), 70 miles southwest of Tabriz and 10 miles west of Lake Urmiah (Map: Persia, A 4). It lies amid attractive mountain scenery. The American, French, and Russian missions have headquarters here, and have founded several institutions, including Urmia College, a college for Nestorian priests and deacons, and Piske Seminary. The district produces fruit, cotton, and tobacco, and there are important dyeing and weaving interests. Pop., estimated at from 30,000 to 35,000. In 1915 the majority of the Armenian inhabitants were massacred by invading Turkish troops. Urmiah is reputed to be the birthplace of Zoroaster. It was for a long time the pilgrimage city of his followers.

URUMIAH, LAKE. The largest lake in Persia, situated in the northwest corner of the country, 170 miles west of the Caspian Sea (Map: Persia, A 4). It is about 80 miles long, with an average breadth of 20 miles, and occupies part of a level basin inclosed by mountains and lying at an altitude of over 4000 feet. The lake is fed by radial streams of considerable size, but it has no outlet. It is consequently very saline, too salt to nourish any life but certain crustaceans; the lake has been shrinking for years, exposing wide tracts of sour slime. It is very shallow, the mean depth being 6 feet, and the maximum about 40 feet. The surrounding region is very fertile, and is covered with vineyards, orchards, and gardens.

URUNGU. A river in Siberia. See **IRYSH**.

URUS (Lat. *urus*, Gk. *οὔρος*, *ouros*, wild ox, from OHG., AS. *ūr*, Ger. *Auer-ochs*, whence the English *aurochs*, designating a different animal, the European bison; connected with Skt. *usra*, steer, reddish). A wild ox (*Bos primigenius*)

which anciently inhabited the forests of central Europe, and is described by Cæsar as common in the Hercynian Forest, and of great size, swiftness, and fierceness. The probability is that the urus was the wild original of the domestic ox, by way of the small or long-fronted ox (*Bos longifrons*), which was the earliest known domesticated ox in Europe. The urus survived in Germany until the twelfth century, and is sometimes wrongly identified with the aurochs (q.v., under **BISON**).

URVILLE, JULES SÉBASTIEN CÉSAR DUMONT D'. See **DUMONT D'URVILLE**, J. S. C.

URY, ADOLFO MÜLLER. See **MÜLLER-URY**, ADOLFO.

US'BEGS. A people of Russian Turkestan. See **UZBEKS**.

USE. This expression was used to describe a trust created under the early English practice. (See **USES**; **TRUST**.) One of the methods of avoiding the effect of the Statute of Uses (27 Hen. VIII, c. 10) was by making a conveyance to A to the use of B to the use of C. The statute executed the first use, and the property was accordingly held in trust for C.

USE, SHIFTING. See **SHIFTING USE**.

USE, SPRINGING. See **SPRINGING USE**.

USE AND OCCUPATION. In law, a phrase employed to denote the beneficial enjoyment of real estate by a person with the owner's consent, but without any definite or enforceable agreement as to the amount of rent to be paid. The landlord is entitled to recover a reasonable sum as compensation for the use and occupation of the premises. See **LANDLORD AND TENANT**; and consult the authorities there referred to.

USEDOM, ū'ze-dōm. An island belonging to the Province of Pomerania, Prussia, situated at the mouth of the Oder River (Map: Germany, F 1). Together with the island of Wollin, it separates the Stettiner Haff from the Baltic Sea. It is divided from the mainland on the west by the outlet of the Peene River. Length, 33 miles; area, 158 square miles. It is extremely irregular in shape. It is level and generally fertile save for some sand dunes. Its farm lands and forests are productive. Fishing and commerce also engage the attention of its inhabitants, who number about 35,000. In summer the sea baths attract a large number of visitors. Swinemünde is the principal town.

USE INHERITANCE. The Lamarckian principle of the transmission by heredity of characters acquired during the lifetime of the individual; they are contrasted with congenital characters. That slight lesions are not transmitted was apparently proved by the experiments of Weismann in docking the tails of white mice for 19 generations, and his finding that such a mutilation was not transmitted. At the present time the alleged transmission of mutilations or various lesions, as tattooing or flattening of the head, is not proved. On the other hand, the Lamarckian principle of the inheritance of characters formed by adaptation to changes in the physical environment, changes of climate, as well as those resulting from use or disuse, or any kind of external stimulus, although denied by Weismann and his followers, have not been disproved. Adaptation to a different medium from that of their ancestors, as in the case of birds and insects, is the result of use inheritance. Very obvious examples are the cetaceans where, by change from terrestrial to aquatic habits, the legs have been converted into

finlike members. Another instance is the acquired habit of pointing in the pointer breed, cases being known of young dogs pointing without having been trained. The habit of holding the tail erect is an acquired one in dogs, as the wolf and fox never elevate the tail. The senile expression of the face in children of old parents is claimed to be an example of such inheritance. Such examples as these prove that, as Eimer states, every character formed by the functional activity of the animal is an acquired character. The changes begin during the lifetime of the individual, become transmitted (or at least the tendency), until after a number of generations, the new conditions becoming permanent, the new characters are formed, and these are preserved by use inheritance.

The experimental proofs of use inheritance have accumulated sufficiently to prove that, where the changed climate, or temperature and moisture or dryness of the air, remain the same, the new characters are transmitted. In plants, where use and disuse do not come into play, the changes of station, of climate, temperature, soil, and nutrition, when permanent, result in the formation of new varieties and species, according to the Lamarckian principle. It is maintained that the transmission of acquired characters, structural, physiological, and mental, is demanded by the theory of evolution. Weismann's objection to use inheritance is that modifications of the animal are acquired anew in every individual life and cannot be transmitted. It remains to be seen whether this criticism will withstand the mass of data now being accumulated. Consult: Lamarck, *Zoölogical Philosophy*, English translation by Hugh Elliot (London, 1914); also the writings of Darwin, Koelliker, Eimer, Cope, Herbert Spencer, Galton, Hyatt, Weismann, Standfuss, Fischer, Packard, Piepers, Kidd, and others. See EVOLUTION; HEREDITY.

USENER, ū'ze-nēr, HERMANN (1834-1905). A German classical scholar, born at Weilburg-on-the-Lahn. He became professor at the University of Bonn in 1866. His work covered many fields, both literary and philosophical. Especially important are his studies in the history of religion. His published works include *Anecdotes Holderi* (1877), *Altgriechischer Versbau* (1887), *Epicurea* (1887), *Dionysii Halicarnensis de Imitatione, etc.* (1890), *Dionysii Ars Rhetorica* (1895), *Dionysii Opuscula* (ed. with Radermacher, vol. 1, 1899), *Religionsgeschichtliche Untersuchungen* (1888), *Götternamen* (1896), *Sintflutsagen* (1899); *Vorträge und Aufsätze* (1907). Since his death two volumes of his *Kleine Schriften* have appeared (Leipzig, 1913). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

U'SERTE'SEN. The name of three kings of Egypt of the twelfth dynasty.—**USERTESEN I**, the Σεούργωσις of Manetho, was the son and successor of Amenemhat I (q.v.), the founder of the dynasty. His reign of 44 years began about 1976 B.C., but for the first 10 years he ruled as Coregent with his father, and for the last two years of his life his son, Amenemhat II, was associated with him on the throne. According to a leather roll, written in the time of Amenophis IV, the temple of the sun at Heliopolis was rebuilt in the early part of Usertesen's reign. One of the two granite obelisks erected by Usertesen before this temple is still stand-

ing; it is 66 feet in height and is the oldest obelisk in Egypt. (See OBELISK.) At Tanis three finely executed granite statues of the King have been found. A stele was discovered by Champollion at Wadi Halfa, near the second cataract of the Nile, containing a list of 11 Nubian tribes conquered by Usertesen, and an inscription at Beni Hassan records an expedition to Nubia in the King's forty-third year. The remains of Usertesen's pyramid tomb are still to be seen at Lisht, about 30 miles south of Cairo.—**USERTESEN II**, the fourth King of the dynasty, was the son of Amenemhat II, and the grandson of Usertesen I. He reigned from about 1896 B.C., being for a short time Coregent with his father. A painting in a tomb at Beni Hassan, which depicts a number of Asiatics visiting the Nomarch Chnumhotep in the sixth year of Usertesen II, has been supposed to represent the arrival in Egypt of Abraham or of the sons of Jacob, but there is no evidence in support of either theory, and both are equally improbable. Statues of Usertesen II and of his Queen Nofret were found at Hieraconpolis and at Tanis respectively. The pyramid tomb of the King is at Illahun. Manetho calls this King Sesostris and ascribes to him the conquest of the world, but there is no evidence that Usertesen II ever conducted any foreign wars. (See SESOSTRIS.)—**USERTESEN III**, the son and successor of Usertesen II, reigned for at least 26 years from about 1883 B.C. His chief energies were directed to the subjugation of Nubia; and to protect the southern frontier of his Kingdom, he built two strong forts at Semneh and Kummeh, about 40 miles south of the second cataract of the Nile. Near Semneh the King set up, in the eighth year of his reign, a boundary stone with the injunction that no negro should pass it except such as came into Egypt for the purpose of peaceful traffic. He was, however, compelled to undertake two subsequent expeditions against the Nubians in the sixteenth and nineteenth years of his reign, before the country was finally subdued. Usertesen III built a temple at Heracleopolis (q.v.) in his fourteenth regnal year. His tomb is probably the more northerly of the two brick pyramids at Dahshur known as the Black Pyramids. Breasted, *A History of the Ancient Egyptians* (ib., 1908). Consult Sesostris, *Ancient Records of Egypt* (Chicago, 1907).

USES. A technical term employed to denote equitable rights to the benefits and profits of real estate, the legal title to which is in a person other than the beneficiary of the "use." The introduction of the doctrine of uses was the result of the attempts of the English clergy to evade the effects of the Statutes of Mortmain, and to enjoy the gifts of the pious. To do this, land was conveyed to a third person, with the understanding or an express declaration that it was to be held to the use of the religious person or corporation intended to be the real donee. When this practice was first introduced, this obligation could only be enforced by threats of excommunication from the Church. Afterward the Chancellor, who was usually appointed from the clergy, assumed jurisdiction over such conveyances, and employed the power of the

courts of equity to enforce the use. This effect of such conveyances aroused the hostility of the King and great lords of the realm, which culminated in the enactment of the famous Statute of 27 Hen. VIII, c. 10, commonly known as the Statute of Uses. This act provided, in effect, that where a conveyance was made under the circumstances above described, the beneficiary should receive the legal estate as well as the right to the profits, etc., and also be liable to the lord for the feudal duties. The statute only temporarily accomplished its purpose, as the courts of equity speedily evolved the law of "trusts," which were practically the same as "uses," but under a different name. However, the statute had the important effect of making possible the creation of legal estates to begin in the future without making them legal remainders. The system of conveyancing made possible by the Statute of Uses was finally superseded by the practice of transferring property by deeds of "bargain and sale." The law of uses, as modified by the Statute of Uses, became a part of the common law of the United States, and still obtains in many States, but has been expressly abolished in a few jurisdictions, including New York. See TRUST, and the authorities there referred to; see also REAL PROPERTY.

USHAK, ū-shāk'. A town of the Vilayet of Brusa, Asia Minor, Turkey, 125 miles east-northeast of Smyrna. It is noted for its carpet manufactures, and it is the centre of a rich agricultural district. Pop., about 14,000.

USHANT, ūsh'ant. An island in the Atlantic Ocean, belonging to the Department of Finistère, France, 13 miles west of the northwest end of Brittany (Map: France, N., A 4). To the French it is known as the Isle d'Ouessant. Area, 6 square miles. The shores are rocky. Ushant has modern fortifications, and is used for military purposes. Naval battles between ships of the French and English occurred off the island in 1779 and 1794. Pop., 1901, 2717; 1911, 2568.

USHAS, ūsh'ās (from Skt. *vas*, *us*, to burn; connected with Gk. *ἠώς*, *Ēōs*, Lat. *Aurora*, Lith. *aušrā*, dawn, and ultimately with Eng. *east*). In Vedic India, the goddess of dawn. The Rig-Veda devotes 20 hymns to her as the divine personification of the morning light. The fiery steeds or ruddy cows that draw her shining car represent clouds and beams of light that issue from the stall of darkness as she throws open the portals of day. Born each day, and therefore ever young, she reminds mankind of the transitoriness of human life, and by her return day after day she stands as a symbol of the divine order in heaven. The sky is her father; night is her sister; the sun, Surya (q.v.), her lover and spouse; and the twin Asvins (q.v.) are her kin. The sacrificial fire kindled at day-break is a signal of her approach (see AGNI), and she then arouses the worshiper to prayer. She answers his petitions by bestowing all the blessings of daily life. In the post-Vedic period the importance of Ushas is lost, and now she is a mere name in the Hindu mythology. Consult: A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); Hillebrandt, *Vedische Mythologie*, ii (Breslau, 1899); W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900); L. D. Barnett, *Antiquities of India* (London, 1913).

USH'ER, JAMES. A British archbishop. See USSHER.

USH'ER, ROLAND GREENE (1880-). An American historian, born at Lynn, Mass. He was educated at Harvard (A.B., 1901; Ph.D., 1905), and abroad at Oxford, Paris, and Cambridge. Connected with Washington University, St. Louis, from 1907, by 1912 he had become associate professor in charge of the history department. His writings include: *The Presbyterian Movement in the Reign of Queen Elizabeth* (1905); *The Reconstruction of the English Church* (2 vols., 1910); *The Rise and Fall of the High Commission* (1913); *The Rise of the American People* (1914); *Pan-Germanism, from its Inception to the Outbreak of the War: a Critical Study* (1914); *Pan-Americanism, a Forecast of the Inevitable Clash between the United States and Europe's Victor* (1915); *The Challenge of the Future* (1916).

USHER OF THE BLACK ROD. See BLACK ROD.

USHUAIA, ū'shōō-ā'yā. The capital of the Territory of Tierra del Fuego, Argentina, on the south coast of the island of Tierra del Fuego, on the Beagle Channel (Map: Argentina, F 8). It is a miserable native village, whose inhabitants, through the efforts of English missionaries, speak English better than Spanish. Pop. (est.), 500.

USKUP, ūs-kup', **USKUB**, or **SKOPLIE**. A city of Serbia and capital of the department of the same name, 160 miles northwest of Saloniki, on the Vardar River (Map: Balkan Peninsula, C 4). The chief articles of commerce are opium, grain, live stock, fruit, and tobacco. Leather and dyestuffs are the principal manufactured products. Long the capital of the Vilayet of Kossovo in the Ottoman Empire, it was captured by the Servians in October, 1912, in the course of the Balkan War (q.v.), and was confirmed to them by the Treaty of Bucharest (August, 1913). It was captured by the Bulgarians in 1915. (See WAR IN EUROPE.) Pop., 1911, 47,384.

USNEA, ūs'nē-ā (Neo-Lat., from Ar. *usnah*, moss). A small genus of lichens. The species are generally grayish or straw-colored and pendulous, and from their resemblance to southern or Spanish moss (*Tillandsia*) are often called tree mosses. They are most common upon trees in cool regions, but also grow upon rocks. They are called beard moss, hanging moss, and necklace moss. See Colored Plate of MOSSES AND LICHENS under MUSCI.

USPENSKOYE, ūs'pēn-skō'yē. See BOLGARY.

USPENSKY, ūs-pēn'skē, GLEB IVANOVICH (1840-1902). A Russian writer of folk tales, born at Tula and educated at the universities of St. Petersburg and Moscow. His first stories appeared in the *Observer* in 1862, while he was still a student, but not before his series of sketches entitled *Stray-Street Life* began to appear in the famous *Sovremennik* (1866) did he attract general attention. Uspensky also contributed to *Notes of the Fatherland* and other periodicals. His fame was at its height when he was attacked by a disease of the brain which ended his literary career nine years before his death. Uspensky's special interest was in the sufferings of the lowly provincial folk, whose life he depicted with unusual fidelity and sympathy. His *Drudgers*, which touches upon peasant morality, practically revealed the real peasant to Russian readers, while *The Power of the Land* was a sincere plea against the urbanization of the peasantry. His collected

works have been published repeatedly—one edition in six volumes (St. Petersburg, 1908).

US'SHER, JAMES (1581-1656). Archbishop of Armagh, commonly considered the most learned prelate of the Irish Protestant church. He was born in Dublin, Jan. 4, 1581. In 1594 he entered Trinity College, Dublin, where his predilection for history soon revealed itself. In 1601 he was ordained deacon and priest, and was appointed preacher of Christ Church, Dublin. In 1607 he was chosen to the chair of divinity, a post which he held for 13 years. He made numerous visits to England and became acquainted with the most distinguished scholars of the age. In 1613 his first publication appeared, entitled *De Ecclesiarum Christianarum Successione et Statu*, which was designed as a continuation of Bishop Jewell's *Apology*. In 1615 he was appointed by a convocation of the clergy held at Dublin to draw up a series of articles relating to the doctrine and discipline of the Irish Protestant church, in which the doctrines of predestination and reprobation (of which Ussher was an unflinching apologist) found prominence. These and other views, such as that bishops were not a different order from presbyters, implied in the studied omission of all reference to such distinction, that the Sabbath should be strictly enforced, and that no toleration should be granted to Catholics, laid him open to the charge of Puritanism. Nevertheless, King James promoted him to the bishopric of Meath and Clonmacnoise in 1621 and in 1623 constituted him a Privy Councillor of Ireland. In 1624-25 he was raised to the highest ecclesiastical dignity in Ireland, the archbishopric of Armagh. In 1632 Ussher published *Veterum Epistolarum Hibernicarum Sylloge*, a collection of letters out of several ancient MSS., concerning the state of the Irish church from 592 to 1180; in 1638, *Immanuel, or the Mystery of the Incarnation*; in 1639, *Britannicarum Ecclesiarum Antiquitates*, an account of the British church to the end of the seventh century; in 1641, *The Judgment of Doctor Rainoldes touching the Originall of Episcopacy Confirmed*; and *The Originall of Bishops*. When the Civil War broke out, Ussher, who was in England at the time, espoused the side of the King, refused an appointment to Westminster Assembly, and made himself obnoxious to the Parliament by the sermons which he preached at Oxford. Upon the triumph of the parliamentary party his property and revenues in Ireland were seized, and after a residence in Wales and elsewhere, he came to London, where in 1647, in spite of his Royalist sympathies, he was chosen preacher of Lincoln's Inn, a post which he retained till his death at Reigate, March 21, 1656. Cromwell ordered his remains to be interred with great magnificence in Erasmus' Chapel in Westminster Abbey.

Ussher's chief works, besides those already mentioned, are his edition (1644) of the *Epistolæ* of Polycarp and Ignatius; his treatise *De Romance Ecclesie Symbolo Apostolico Diatribe* (1647); *Dissertatio de Macedonum et Asianorum Anno Solari* (1648); and *Annals of the Old Testament* (1650-54), a chronological work. After his death there were published (from his numerous MSS.) *Chronologia Sacra*, etc. (Oxford, 1660), by which and his *Annals* he is most widely known. These chronological calculations long appeared in the inner margin of the Bible in the Authorized Version. The most frequently

reprinted work attributed to him is the posthumous *Strange and Remarkable Prophecies and Predictions of James Ussher* (London, 1678; new ed., 1825). A collected edition of Ussher's works, in 71 vols., with a new biography, was published at Dublin in 1841-64 by C. R. Erlington and J. H. Todd. Consult also the *Life* by Carr (London, 1895), and W. B. Wright, *The Ussher Memoirs* (Dublin, 1889).

USSURI, ūs-sŭ'rě. A right-bank tributary of the lower Amur. Its head streams rise to the northeast of Vladivostok. After a course of 90 miles it receives the Sungachi, which drains Lake Khangka. The Ussuri forms the boundary in part between Manchuria and the Russian Maritime Province. The general course of the Ussuri is northeasterly, and it joins the Amur a little west of Khabarovsk, from which point the Amur valley is connected with Vladivostok by a railroad along the Ussuri valley.

UST-BYELOKALITVENSKAYA, ūst byě-lō-kŭ'lět-věn'ski-yā. A Cossack settlement in the Province of the Don Cossacks, southeastern Russia, on the Donetz, about 70 miles northeast of Tcherkask. Pop., 1897, 18,039.

USTILAGINALES, ūs'ti-lāj'i-nā'lēz (Neo-Lat. nom. pl., from Lat. *ustilago*, plant of the thistle kind). A group of parasitic fungi commonly called smuts or brand fungi, and found on flowering plants, whose floral parts and ovaries especially are subject to the attack. Some smuts are very destructive, as corn smut (*Ustilago maydis*) and the stinking smut of wheat (*Tilletia triticea*). The vegetative mycelium of the smut is inconspicuous until the season is well advanced and the ovary should begin to ripen. Then the ovary and the adjoining floral parts become filled with the fungal filaments. At the end of the season this mycelium produces immense numbers of resting spores (chlamydospores) known as brand spores. These escape as a black powder, and survive the winter, germinating with the return of

USTILAGINALES.

1, development of spores; 2 and 3, germination of spores promycelia and fusing sporidia; 2, *Ustilago*; 3, *Tilletia*.

spring. The spore develops a short filament (promycelium), which exhibits far greater variation of structure than in the rusts. Numbers of minute spores (sporidia) are developed by the promycelium, and, falling upon the seedlings

and young plants of the proper host, or in the opening flowers in some genera, germinate, sending the germ tubes through the stomata into the tissues.

For a general account of the Ustilaginales consult Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887), and Plowright, *British Uredineae and Ustilagineae* (London, 1889). See BASIDIOMYCETES; SMUT.

UST-MEDVEDITSA, ūst-mēd-vyēd'it-sā. A Cossack settlement in the Province of the Don Cossacks, southeast Russia, on the right bank of the Don, near its confluence with the Medveditsa (Map: Russia, F 5). Pop., 1910, 10,400.

USTYUG VELIKY, us-tyuk' vyē-lyé'ké. A town in the Government of Vologda, Russia, situated at the junction of the Sukhona with the Yug, 303 miles northeast of Vologda (Map: Russia, G 2). It has linen factories of considerable importance. Pop., 1911, 18,707.

USUFRUCT, ū'zū-frūkt (Lat. *ususfructus*, from *usus*, use, from *uti*, OLat. *oliti*, to use, connected with *avere*, to crave, Skt. *av*, to promote, protect, like, Gk. *alos*, *oitos*, fate, portion + *fructus*, fruit, from *frus*, to enjoy). At civil law, a life interest in property, usually established by legacy, but capable of being established by contract. It is also created by law, especially in modern civil legislations, many of which give usufruct to parents in the property of minor children and to the surviving spouse in the estate of the deceased husband or wife. (See PARENT AND CHILD; SUCCESSION; TESTAMENT.) Usufruct is regarded as a servitude (q.v.), the general right of ownership (*proprietas*) being attributed to the reversioner, i.e., the person who is to take the property on the termination of the usufruct. The usufructuary has the exclusive right to possess, use, and enjoy the property, either in person or through a vendee or lessee. He must, however, use it *salvā substantiā*, i.e., the property must not be injured; nor may he change the character or mode of use. For the restoration of the property in unimpaired condition the usufructuary must ordinarily give security to the owner. Usufruct may be established not only in land and buildings, but also in non-consumptible movables, i.e., in such movables as can be used without impairment of substance. In consumptibles, true usufruct is impossible; but for the purpose of carrying out the intentions of testators the Roman jurists developed the so-called quasi-usufruct, in which the property is appraised and the usufructuary gives security that the sum at which it is valued shall be paid, after his death, to the holder of the reversionary interest. In modern law a usufruct or life interest may generally be freely created both as to real and personal property.

USUMACINTA, ū'su-mā-sēn'tā. A river of Central America. It rises in the mountains of southern Guatemala and flows in a winding northwest course through that country and Mexico, emptying into the Gulf of Campeche on the boundary between the Mexican states of Campeche and Tabasco (Map: Central America, B 2). Its length is about 400 miles, and it is navigable a short distance from the sea. In its middle course it forms the boundary between Mexico and Guatemala. Its upper course, which is through a little-known forest region, was made by treaty the boundary between the two re-

publics, and a dispute as to which was the main head stream nearly led to a war in 1895.

USURY (OF., Fr. *usure*, from Lat. *usura*, use, employment, interest, from *uti*, to use). Literally, money paid for the use of money, i.e., interest; but in the Middle Ages, when such payments were prohibited, the word obtained an evil sense, and when in modern times the taking of interest again became permissible, usury acquired its modern meaning, i.e., interest in excess of a fair return, and, particularly, in excess of a legally determined maximum. The establishment of such a maximum was general in the ancient world; at Roman law it varied, at different periods, from 12 per cent to 6 per cent; and when the taking of interest was legalized in the modern world, similar limitations were introduced. In England the Act of 37 Henry VIII, c. 9, fixed the limit at 10 per cent. This was repeatedly lowered until, by the Act of 12 Anne, c. 16, it was fixed at 5 per cent. By these laws usurious contracts were made wholly invalid and usury was an indictable offense. In most European countries (as in the Roman law) usurious contracts were invalid only as regarded the excess of interest, and contracts in which the lender assumed special risks (e.g., bottomry bonds) were not subjected to limitation of rate.

In the eighteenth century the usury laws were attacked by economic writers as arbitrary and unwise. It was pointed out that in all credit transactions there was an element of risk; that the risk varied greatly and might, in many cases, justify the taking of interest beyond the legal maximum; and that the effect of usury laws was to impose upon borrowers a higher rate of interest than they would otherwise be required to pay, in order that the lender might insure himself against the additional risk to which he was subjected by the illegality of the contract. In consequence of these arguments limitations upon the rate of interest were generally repealed in the nineteenth century. In England this was done by the Act of 17 and 18 Vict., c. 90. In France, however, the usury laws were repealed only as regarded commercial contracts.

Adam Smith defended usury laws because they made it more difficult for spendthrifts to borrow money; and in the latter half of the nineteenth century, in connection with the general reaction against laissez-faire doctrines, the complete freedom of contract established by the repeal of the usury laws was in its turn condemned by many economists. It was urged that in many cases borrowers were at the mercy of lenders and that they should be protected against extortion of unreasonable interest. This theoretical reaction has affected modern European legislation. In Germany, by a law of 1880, "any person who, by exploiting the necessity, the frivolity, or the inexperience of another, causes to be promised to himself or to a third person, for a loan or for deferred payment of a debt, pecuniary advantages which so exceed the ordinary rate of interest that under the circumstances they are in striking disproportion to the debt," is punished with imprisonment up to six months and fine up to 3000 marks. By law the legal commercial rate is limited to 5 per cent in Germany and 6 per cent in France. In England, by an act of Parliament passed in 1900, it is provided that professional money lenders shall be registered, and that their contracts shall be subject to judicial revision when the rate of interest appears under the circumstances to be

unreasonable. This leaves it to the courts to determine what is, in each case, a reasonable rate. In the United States laws are enacted fixing the legal rate and the contract rate of interest. All States fix legal rates, or maximum rates collectable in the absence of definite agreement, at from 5 to 8 per cent. All but Vermont have fixed maximum contract rates, usually at 10 or 12 per cent, but at any rate whatever in California, Colorado, Maine, Massachusetts, and Rhode Island. In recent years various States have enacted special laws regulating pawnbrokers and the business of lending money on salaries ("loan sharks"). The penalties for violations of usury laws are varied. In Connecticut, Georgia, Indiana, Kansas, Kentucky, Maryland, Missouri, New Mexico, Ohio, Pennsylvania, Tennessee, Vermont, and West Virginia the creditor can recover principal and lawful interest, losing only the excess interest. The penalty is loss of interest in Alabama, Alaska, Arizona, District of Columbia, Florida, Idaho, Illinois, Iowa, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, New Jersey, Oklahoma, Porto Rico, South Carolina, South Dakota, Texas, Virginia, Wisconsin, Hawaii, and Wyoming. In some States a usurious contract is wholly void; thus in Arkansas, New York, and Rhode Island both principal and interest are lost, and in Delaware and Oregon the principal; moreover Rhode Island adds fine or imprisonment. In Idaho the lost interest and in Oregon the lost principal are paid by the borrower to the school fund. In some of these States money actually paid on a usurious contract cannot be recovered by the lender; but the general rule is to the contrary, and in some States the actual receipt of usurious interest exposes the lender to further penalties, e.g., double the amount paid in North Carolina, North Dakota, and Washington, and three times the excess in New Hampshire. California, Colorado, Maine, Montana, and Nevada have enacted no specific penalties for usury. In some other States the lender is liable to prosecution and fine or imprisonment, but such prosecutions are rare. In Delaware any person may bring action against a lender who has received usurious interest, and, if successful, will receive one-half of the principal of the debt, the other half going to the State.

Not infrequently special contracts are exempted from the operation of the usury laws, either because special risks are assumed by the lender, or on grounds of commercial interest. In several States corporations are not permitted to plead usury.

Usury laws are, in general, strictly construed. Whenever the law declares a usurious contract invalid, mortgages, trust deeds, and all forms of surety are also invalidated; but the courts do not assume that a Legislature has intended to avoid the contract as regards the principal of the debt, or as regards the legal interest, unless such penalty is expressly imposed; nor is penalty, as distinguished from the protection of the borrower, incurred by merely stipulating for usurious interest, but only by receiving it.

In interstate cases (conflicts of law, q.v.) the question whether a contract is or is not usurious is governed by the law of the place where the contract was concluded, unless a different place was expressly or impliedly indicated as the place of performance. When a debt has been contracted in one State to be paid in another, and the rate of interest stipulated is usurious in one

of the States but not in the other, some of the courts apply the local law which will uphold the contract. Penalties in the strict sense (as distinguished from the legal protection given to the borrower) are not enforced outside of the jurisdiction in which they are imposed. See INTEREST.

A. Webb, *A Treatise on the Law of Usury* (St. Louis, 1899); Wm. Cunningham, *Christian Opinion on Usury* (London, 1884); F. J. Stimson, *American Statute Law* (Boston, 1902).

UTA, *ŭ'tà* (Neo-Lat., from the State of Utah). A genus of iguanid lizards, several species of which are numerous on the southwestern plains of the United States, one of which (*Uta stansburiana*) is one of the most beautiful and graceful of American lizards. It is blackish brown above, marbled with lighter dots, and banded with yellow below. Its long, slender tail has a crest of large vertically set scales. This genus combines structural characteristics of *Sceloporus* and *Holbrookia*.

UTAH, *ŭ'ti* (named from the Ute or Utah tribe of Indians). A State in the western part of the United States called by the Mormon pioneer settlers *Dcsert*, a term taken from the Book of Mormon and signifying industry. Its boundaries are limited by lat. 37° and 42° north, and long. 109° 4' and 114° 4' west. Its shape is practically that of a rectangle 345 miles long north-south by 270 miles wide east-west, indented at the northeast corner by Wyoming. The State has an area of about 85,000 square miles, including a probable average of 3000 square miles of lake water. The latter area, on account of the shallowness of the water and the variation of annual rainfall, changes considerably from year to year. Utah ranks eighth in size among the States of the Union.

Topography. Utah is divided into two great provinces, an eastern and a western, by the Wasatch Mountains, which enter the State from Idaho and extend in a southerly direction for about 150 miles, terminating at Mount Nebo, which is situated almost precisely at the centre of the State. This central highland continues southward as the High Plateau to central Arizona. The eastern half contains all of the high and more serrate mountains, while the western forms a part of the Great Basin, much of which is relatively flat, with small ranges here and there half buried in the sediments of the Pleistocene Lake Bonneville. The Wasatch Mountains constitute a lofty and picturesque range, especially when viewed from the west. A noteworthy feature is that while most of the water of this range drains westward into the Great Basin, it has to cut through the principal mountain axis to do so. Evidences of recent glacial action, such as lakes, cirques, moraines, etc., are abundant in many of the cañons. At several points these mountains reach an elevation of practically 12,000 feet.

The Uinta Mountains trend east-west within the extreme northeastern part, and in the matter of direction of axis, form perhaps the most notable exception of all the ranges comprising the Rocky Mountain system. They are the loftiest in the State, having four peaks over 13,000

feet, the highest of which is Gilbert Peak, with an elevation of 13,687. These mountains are unusually steep and serrate, and in the highest parts are thickly set with numerous glacial lakes. Away to the south and southeast are the Henry, Abajo, and La Sal mountains. The world's largest and most famous natural bridges are situated in the Bad Lands country across the Colorado River from the Henry Mountains. See NATURAL BRIDGE.

The mountains of west Utah are much lower than those in the east. The relationship of these mountains to the recent alkaline sediments surrounding them in many places gives them the appearance of islands protruding from water.

Hydrography. Eastern Utah is drained by a large number of streams, all of which finally unite to form the great Colorado. Except in their upper courses most of the streams flow through deep, steep-sided cañons, eroded far below the plateau floor. A very small area in the extreme northwestern part of the State sends its waters through the Snake River drainage to the Pacific Ocean. The remaining part of western Utah lies within the Great Basin, and contributes its waters chiefly to two closed drainage systems, the Sevier and Great Salt Lake. All of the streams of this section have their origin in the central highland and flow generally westward into the depressions just mentioned. Sevier Lake, which, during dry seasons, is scarcely more than a salt playa, derives its waters chiefly through Sevier River, which has its head far up in the High Plateau region. Great Salt Lake is supplied principally by Weber River, Bear River, Malad River, and Jordan River, the latter being overflow from Utah Lake to the southward, which in turn is supplied by a number of cañon streams. In the southern part of the Great Basin numerous streams flow from the mountains only to be lost in the sands of near-by desert sections. Great Salt Lake (q.v.) is the most conspicuous natural feature of the State.

Soil. The soil in many local sections is unusually fertile, especially in the upland valleys and other areas adjacent to the mountains, but over a large part of the Great Basin floor it is highly alkaline and incapable in its present condition of supporting vegetation. The better grades of soil are deep sandy loams derived from the silt of cañon streams. Until within recent years practically all of the crops were produced by artificial watering, but of late rapid improvement in dry-farming methods has brought about the utilization of considerable acreage where irrigation is impossible.

Climate. The climate in the main is of the plateau type, characterized by rather wide extremes in summer and winter. The populated areas, however, are generally mild and equable, largely because of the protection which comes from the near-by mountains. The precipitation varies from 6 to 25 inches between points ranging from 2800 to 7000 feet elevation, a variation which is largely due to topographic conditions. The average precipitation is 12.5 inches. The average temperatures are 71° in July and 26° in January, or an annual average of 48°.

Geology. The surface geology of Utah is extremely complicated, especially in the mountainous districts. Every formation from ancient to recent is represented, as are also a wide variety of structural forms. The Wasatch

Mountains may be regarded as a great fold broken down on the west side by an enormous fault extending almost the entire length of the range. The axis of this half fold is also flexed at right angles to its elongation, thus giving rise to considerable complexity. Formations from Pre-Cambrian to Cretaceous are involved in the mountains proper, with Tertiary sediments and more recent igneous extrusions flanking them on the east and Pleistocene lake deposits on the west. The High Plateau is composed of Mesozoic to Cenozoic sediments capped in a large number of places by recent surface flows. The Uinta Mountains consist of a great anticlinal fold with marked displacement on the north flank. Along the axis vast erosion has carried away all of the formation from Cretaceous down to Pre-Cambrian. The Tertiary sediments here also overlap the eroded and upturned edges of the older members. The Henry Mountains, situated far down in the plateau province, furnish several examples of the world's best type of laccolith, and consist of intrusive cores flanked by upturned sediments. The block type of mountain is well represented by the ranges of western Utah, where the formations are practically all of Paleozoic and Pre-Cambrian age.

Mineral Resources. Utah possesses vast quantities of high grade bituminous coal, also large deposits of lignite, both of Cretaceous age. The State is famous for its production of elaterite, ozokerite, and other natural hydrocarbons. Radium-bearing ores have recently been added to its production. Enormous iron deposits in the southwestern part of the State are awaiting development. Utah, ranking thirteenth in 1914 in the total value of mineral production, is unique in that, while it does not lead in the value of any one product, it is among the foremost States in the production of the various precious and semiprecious metals. Copper is the most important product of its mines, about four-fifths of it coming from Salt Lake County; the production in 1914 amounted to 152,034,002 pounds, valued at \$20,220,522. Lead ranks second, and of this metal 86,662 tons valued at \$6,681,602 were produced in 1914. Utah ranked third in the value of lead production, about 90 per cent of which is from silver-lead ores, which also supply about half of the silver product. The value of the silver produced in 1914 was \$6,168,860 for 11,154,916 fine ounces. Coal is the most important of the non-metallic minerals. The production, almost entirely from Carbon County, amounted to 3,103,036 tons valued at \$4,935,454. Most of the gold produced is obtained from the refining of copper, though about 35 per cent of it is obtained from dry or siliceous ores. The production in 1914 amounted to 157,961 fine ounces valued at \$3,265,347. Of zinc there were produced in that year, 7995 tons valued at \$815,453. Other minerals produced are asphalt, cement, clay products, gems, gypsum, lime, salt, sand and gravels, stone. The total value of the mineral production in 1914 was \$45,624,698.

Agriculture. With a rainfall ranging from 5 to 10 inches over the greater part of Utah, reaching 15 inches only in the north central section, farming can only be carried on successfully by the aid of irrigation. Of the total land area of 52,597,760 acres, in 1910, 3,397,699 acres were in farms which numbered 21,676. The improved land in farms measured 1,368,211

acres, and the average size per farm was 156.7 acres. The total value of all farm property including land, buildings, implements, and machinery, domestic animals, poultry, and bees was \$150,795,201. Of the total number of farms in 1910, 19,956 were operated by owners and managers. The foreign-born white farmers numbered 5452, of whom 1922 were English and 1420 Danish. There were but 276 nonwhite farmers.

The following table shows the acreage, production, and value of some of the principal crops as estimated by the Department of Agriculture for 1915.

CROPS	Acreage	Prod. in bu.	Value
Corn.....	13,000	442,000	\$354,000
Wheat.....	320,000	8,225,000	7,074,000
Oats.....	100,000	4,700,000	2,115,000
Rye.....	13,000	202,000	131,000
Potatoes.....	20,000	2,500,000	1,575,000
Hay.....	394,000	985,000	7,880,000
Barley.....	34,000	1,445,000	751,000

In 1909 the total value of all crops was \$18,484,615. The leading crops in order of importance in that year are, hay and forage, wheat, sugar beets, oats, potatoes, and barley. The acreage, production, and value of these products in 1909 were as follows: Hay and forage, 405,394 acres produced 1,015,913 tons valued at \$7,429,901; wheat, 178,423 acres produced 3,943,910 bushels valued at \$3,765,017; sugar beets, 27,472 acres produced 413,946 tons valued at \$1,858,600; oats, 80,816 acres produced 3,221,289 bushels valued at \$1,671,065; potatoes, 14,210 acres produced 2,409,093 bushels valued at \$873,961; barley, 26,752 acres produced 891,471 bushels valued at \$472,816. Vegetables,

States Department of Agriculture estimated that horses numbered 146,000 valued at \$12,556,000; mules numbered 2000 valued at \$156,000; milch cows numbered 96,000 valued at \$5,952,000, other cattle numbered 408,000 valued at \$14,606,000; sheep numbered 2,089,000 valued at \$11,281,000; swine numbered 112,000 valued at \$874,000. The number of fowls reported on farms in 1910 was 691,941 valued at \$327,908. The amount of milk produced in 1909 was 20,486,317 gallons, and the total value of milk, cream, and butter fat sold and butter and cheese made was \$2,067,534. The eggs produced amounted to 4,240,007 dozens valued at \$907,330. The wool sheared in 1915 was estimated to amount to 13,320,000 pounds.

Irrigation. Irrigation is practiced throughout the State, 19,709 farms being so treated in 1909. The acreage irrigated was 999,410, of which 22,448 acres were irrigated by individual and partnership enterprises and 687,260 acres by cooperative enterprises. In all there were in 1910, 2472 enterprises operating 7709 miles of ditches of which 5887 were main ditch having a total capacity of 25,081 cubic feet per second. The Strawberry valley project was the only one being built by the United States Reclamation Service in 1915. This, when completed, will irrigate about 60,000 acres. The reservoir is designed to contain some 280,000 acre-feet of water and to cover an area of 8200 acres when full.

Manufactures. Utah ranked fortieth among the States in value of manufactured products in 1909. The value of products per capita in that year was \$166. The following table gives the more important details regarding the five leading industries, as judged by value of products, for 1904, 1909, and 1914.

SUMMARY OF MANUFACTURES FOR 1914, 1909, AND 1904

THE STATE — FIVE LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manu- fac- ture
			Total	Wage earners (average number)				
Expressed in thousands								
All industries.....	1914	1110	17 129	13,894	\$71,653	\$10,852	\$87,114	\$24,880
	1909	749	14,133	11,785	52,627	8,400	61,989	20,723
	1904	606	9,650	8,052	26,004	5,157	38,926	13,986
Butter, cheese, and condensed milk.....	1909	37	285	214	1,134	116	1,971	358
	1904	49	159	98	406	55	904	175
Cars and general shop construction and repairs by steam-railroad companies.	1909	8	1,790	1,731	959	1,402	2,740	1,515
	1904	7	1,337	1,248	522	904	1,887	1,060
Confectionery.....	1909	17	745	586	1,009	204	1,952	661
	1904	12	405	335	401	103	1,005	317
Flour-mill and gristmill products.....	1909	60	282	184	2,042	131	3,131	620
	1904	63	278	150	1,212	91	2,420	383
Printing and publishing.....	1909	122	1,475	967	2,022	685	2,405	1,682
	1904	104	873	545	1,081	369	1,523	1,198

other than potatoes, had a combined acreage of 7006, and a production valued at \$717,776. Orchard fruits, of which the most important are apples, peaches, and cherries, had products valued at \$640,904. Strawberries are the most important of the small fruits, of which there were produced 3,118,395 quarts valued at \$217,327 in 1909.

Live Stock and Dairy Products. In 1909 the total value of domestic animals on farms was \$28,330,215. On Jan. 1, 1910, the United

Of the total number of wage earners in 1909, 10,562 were male and only 110 under 16 years of age. The prevailing hours of labor for more than half the wage earners were from 54 to 60 per week. The extent to which the manufactures of Utah are centred about the two cities, Salt Lake and Ogden, is shown by the fact that 41.8 per cent of the total number of establishments, 47.6 per cent of the wage earners, and 27.5 per cent of the value of products were attributed to them. For further details regarding

the manufacturing of these cities see under the individual titles.

Transportation. There are no navigable rivers. Railways centre mostly about Salt Lake City. The total mileage of main track in 1915 was 2354. The most important lines and their mileage in that year are the Denver and Rio Grande, 762; the San Pedro, Los Angeles, and Salt Lake, 498; the Central Pacific, 273; the Oregon Short Line, 242; the Western Pacific, 121, and the Union Pacific, 75.

Banks. The history of banking in Utah is very uneventful. Private bankers became active towards 1860, and from 1860 to 1870 some banks were organized under the Territorial law. The first national bank was established in 1872 with Brigham Young as its president. Like all the economic activities of the Mormons, the banks were controlled by the church authorities, and the high development of mutual confidence which characterizes the members of this faith has saved the banks from crises. Even during the hard times of 1893 the banks of Utah all remained solvent. State banks are more numerous and do a much larger business than the national banks. Savings banks have existed since 1873.

The condition of the banks in 1915 is shown in the following table:

ITEMS	National banks	State banks
Number	23	75
Capital.....	\$3,355,000	4,265,880
Surplus.....	1,593,000	1,083,101
Cash, etc.....	1,651,000	1,661,447
Deposits.....	21,072,000	22,715,760
Loans.....	18,460,000	20,973,696

Government. The constitution adopted on Nov. 5, 1895, has been amended in important essentials. Amendments which may be proposed by either House become part of the constitution when approved by a two-thirds vote of the Legislature and accepted by the electors. Two-thirds of the members of each branch of the Legislature may recommend the calling of conventions to revise the constitution.

Legislative.—The legislative power is vested in the Senate and the House of Representatives. The initiative and referendum are provided for in the Constitution, though until 1916 they had never been in force. Senators are chosen for a term of four years, and members of the House of Representatives for two years, and both must be at least 25 years of age. Regular sessions of the Legislature are held biennially in odd years.

Executive.—The executive department consists of the Governor, Secretary of State, State Auditor, State Treasurer, Attorney-General, and Superintendent of Public Instruction. All hold office for four years. The Governor and Secretary of State must be at least 30 years of age, and the Attorney-General 25 years. All must have been residents of the State for five years next preceding their election. The State Auditor and State Treasurer are ineligible for election as their own successors.

Judicial.—The judicial power is vested in a supreme court, district courts, justices of the peace, and such other inferior courts as are established by law. The supreme court consists of three judges, who are elected for six years, and must be at least 30 years of age

The State is divided into seven judicial districts, for which one or more judges are chosen by the electors for a term of four years. The Legislature may change the limits of any judicial district, or increase the number of districts or the judges thereof. The district court has appellate jurisdiction also from all inferior courts.

Suffrage and Elections.—Every citizen of the United States of the age of 21 years and upward, who has been a citizen for ninety days, and has resided in the State for one year and in the county for four months is entitled to vote. Both male and female citizens enjoy equally all civil, political, and religious rights and privileges. All general elections, except for municipal and school officers, are held on the first Tuesday following the first Monday in November of the year in which the election is held. The use of voting machines is permitted. The United States Senators are elected at the general election held in November, beginning 1914.

Local and Municipal Government.—The unit of local government is the county. Elections are held biennially in each incorporated city and town on the first Monday in November, dating from 1911. In cities of first class there are elected a mayor, four commissioners, and an auditor. The mayor and commissioners are elected for a term of four years, and the auditor for two years.

Miscellaneous Constitutional and Statutory Provisions.—There is a board of labor conciliation and arbitration to safeguard the rights of the labor. There is a law making unlawful certain medicines containing opium, chloral, or alcohol. Employment of any children under the age of 14 in certain designated employments is forbidden. Restrictions are also placed on the employment of females under the age of 21. Indeterminate sentences are provided for persons convicted of crime. The Legislature of 1913 passed a measure providing for mothers' pensions. The State is divided into local option units. Each incorporated city and town is a separate voting unit. Each county outside of such cities and towns is a separate voting unit to determine whether liquor may be sold. There are heavy penalties provided for the shipment of liquor from "wet" to "dry" territories of the State.

Finances. The finances are in a satisfactory condition. At the time of admission into the Union the State assumed the small debt of the Territory, amounting to \$700,000, and additional bonds to the amount of \$200,000 were issued. For the year ending Nov. 30, 1915, the total receipts were \$4,358,004 and the expenditures \$4,889,893. The balance on hand on Nov. 30, 1914, was \$1,366,482, leaving a balance of \$834,953 on Nov. 30, 1915. The bonded debt at the close of the year amounted to \$3,060,000.

Militia. The militia consisted, in 1915, of one battalion of infantry, one battery of artillery, and one troop of cavalry. The strength was represented by 546 enlisted men and 30 officers. In 1910 the number of men of militia age (18 to 44 years) was 84,449.

Population. The population of Utah by periods is as follows: 1850, 11,380; 1860, 40,273; 1870, 86,786; 1880, 143,963; 1890, 210,779; 1900, 276,749; 1910, 373,351; 1915 (estimated) 424,300; 1920, 449,396. In 1910 it ranked forty-first among the States in population. The density per square mile in that year was 4.5. The urban population in 1910 was 172,934 and the

rural 200,417. The number of males in that year was 192,118. The negro population numbered 1444, the Indian 3123, and the Japanese 2110. The native whites numbered 303,190 and the foreign-born whites 63,393. Of the natives, 64,475 were born outside the State, those coming from Illinois, Colorado, Iowa, and Idaho leading in order mentioned. Among the foreign born, the English with 18,082 were by far the most numerous; the Danes numbered 8300, the Swedes 7227, and the Greeks 4039. The males of voting age numbered 104,115 in 1910. The leading cities with their populations in 1910 and as estimated for 1915 were Salt Lake City 92,777 and 113,567, Ogden 25,580 and 30,466, and Provo 8925 and 10,368.

Education. The excellent educational condition of Utah is witnessed by the low percentage of illiteracy, which amounted to 2.5 in 1910; among whites of native parentage it was 0.4, and among foreign-born whites 5.9. According to the thirteenth census the school population was 104,876, ages 6 to 18 years. Of this 87,000 attended school. This is a higher rate than was found in any other State except Kansas. According to the report of the State Superintendent of Education the total school population in 1915 was 121,411. The total enrollment in the public schools was 97,000, and the average attendance was 82,804. There were 2111 female and 740 male teachers. Total school expenditures for the year were \$5,206,746. The average salary paid female teachers in elementary schools was \$71.75 per month, and male teachers \$104.22. There were, in 1915, 44 high schools in which were enrolled about 8500 students. All schools outside the cities of the first and the second class are now organized into consolidated county districts. The Mormon church maintains an efficient educational system. In addition to the elementary schools the church sustains two colleges and eight academies. All these schools offer high-school courses. Three of the institutions, the Snow Academy, Brigham Young College, and the Brigham Young University offer work of college grade.

There are several excellent Roman Catholic academies and schools. These include All Hallows College in Salt Lake City and the Sacred Heart Academy at Ogden. Institutions of collegiate rank are the University of Utah (see **UTAH, UNIVERSITY OF**) and the Utah Agricultural College at Logan, both State institutions and both coeducational.

Charities and Corrections. The Mormon church has women's relief societies organized as the National Women's Relief Societies. Salt Lake City and Ogden have local charitable associations. The State maintains the State Mental Hospital at Provo, the State Industrial School at Ogden, the School for the Deaf and Blind at Ogden, and the State Penitentiary at Salt Lake City.

Religion. Utah is the centre of Mormonism. About three-fourths of its population is allied with the Mormon church. (See **MORMONS**.) In recent years many other denominations have entered the State, of which the Roman Catholics and Methodists are numerically the strongest.

History. The first white explorers of Utah were Spaniards, sent by Coronado (q.v.), who reached the Colorado River in 1540. Two Franciscan friars seeking a direct route to the Pacific went from Santa Fe to Utah Lake in 1776. In the winter of 1824-25, James Bridger, a trapper,

seeking to determine the course of the Bear River, discovered the Great Salt Lake. Other trappers followed in 1825-26, and established posts in the region. Later immigrants to Oregon and California passed through without halting. The real history begins when the Mormons (q.v.), despairing of peace in Missouri or Illinois, determined in 1846 to move west. The Mexican War was then in progress, and in June, 1846, while the emigrants were encamped at the site of Council Bluffs, Iowa, a Mormon battalion was raised for the conquest of California, which then included the whole southwestern part of the United States. The march of the Mormon people was slow and painful. On July 21, 1847, the advance guard reached the present site of Salt Lake City. Other bands rapidly followed, and by 1852 they numbered 15,000. The United States did not obtain possession of the territory until the Treaty of Guadalupe Hidalgo in 1848, and did not immediately provide for its government. At first the church officers were the rulers, but with the coming of non-Mormons in 1849 the State of Deseret was organized, a constitution adopted, and a delegate sent to the United States Congress asking admission. Congress refused to admit the State, but organized the Territory of Utah (Sept. 9, 1850) with boundaries much more extended than at present, and Brigham Young (q.v.) was appointed Governor. He soon quarreled with the other Territorial officers sent out, and the General Assembly adopted the laws of the State of Deseret. In 1854 and again in 1856 admission to the Union was sought. There was constant wrangling, owing partly to the fact that many officers sent out were incompetent and partly because the authorities of the church were determined to rule at any cost. In 1857 it was determined that Young should be superseded as Governor, and for this purpose it was considered necessary to make a display of military strength, as Young had defied the authority of the United States. (See **YOUNG, BRIGHAM**.) For some years troops were kept in garrison at Salt Lake City. An act designed to break up polygamy was passed in 1862. Meanwhile the Perpetual Emigration Fund had been organized in 1849 and thousands of proselytes were brought from Europe. The incoming of non-Mormons was viewed with disfavor. See **MOUNTAIN MEADOWS MASSACRE**.

After the Civil War, the opening of the transcontinental railroad in 1869 brought more "gentiles," and further efforts to enforce the laws were made by some officers, but with little success. The Mormon grand juries refused to indict and the other juries to convict. The death of Young in 1877 apparently made no difference in the condition of affairs. It was finally decided that the only way to break the power of the church was to deprive its members of political power. The Edmunds Bill in 1882 disfranchised all polygamists, and abolished most of the offices in the Territory. Control was given to a commission of five men. Within two years 12,000 were disfranchised and the indignation was so great that troops were sent in 1885 in fear of an uprising. Continued agitation for statehood brought no result, and meanwhile, after it had been held constitutional that juries might consist entirely of non-Mormons, prominent officials were convicted and sent to the penitentiary. A more stringent act was passed in 1887, the corporation of the Mor-

mon church and the Perpetual Emigration Fund were abolished and their property escheated. By 1890, 468 men had been convicted of polygamy, and President Woodruff of the Mormon church issued a manifesto declaring that the church no longer countenanced polygamy, and his action was approved by a general conference of the church. This was followed in 1891 by the formation of political parties on national lines, and in 1893 amnesty was declared to all offenders who could show that they had not broken the law since 1890. Congress passed an enabling act for statehood in 1894, a constitution was formed on March 6, 1895, was adopted in November, and the State was admitted Jan. 4, 1896. The constitution forbids polygamy and allows woman suffrage. Since admission it has been claimed that the people are going back to their old practices, and in 1900 Brigham H. Roberts was not allowed to take his seat in the United States House of Representatives because of a charge of polygamy. Similar opposition was manifested against Senator Reed Smoot, but in February, 1907, the Senate sustained his election.

In the election of 1908 the vote for President was: Taft, 61,015; Bryan, 52,601; Debs, 4895. William Spry was elected Governor by a majority of 9588 over his Democratic opponent. The Legislature reelected Senator Smoot in 1909 and Senator Sutherland in 1911. Utah was one of the two States carried by Taft in the election of 1912. The vote was: Taft, 42,013; Wilson, 36,579; Roosevelt, 24,174. In that year Governor Spry was reelected by a vote of 42,552 against 36,076 for Tolton, Democrat, and 23,591 for Morris, Progressive. In the election of 1914 Senator Smoot was again reelected. The Legislature of 1915 passed a bill providing for State-wide prohibition, which was vetoed by Governor Spry after its adjournment.

In national politics the State voted for the Democratic silver candidate in 1896 but has been strongly Republican since 1900. See also **MORMONS**.

UTAH, UNIVERSITY OF. A coeducational State institution for higher education founded in Salt Lake City in 1850. It was originally called the University of the State of Deseret. After one session it was discontinued until 1867, owing to a lack of funds and patronage. In 1891 a new charter was secured and the present corporate title was assumed. The university in the same year received a grant of 60 acres on the Fort Douglas Reservation, and the State Legislature in 1899 appropriated \$200,000 for buildings on the new site. Congress in 1906 granted the university 32 additional acres on the Fort Douglas Reservation. The university comprises the School of Arts and Sciences, the State Normal School and School of Education, the State School of Mines, established by the State Legislature in 1901, a school of medicine, and a school of law. The attendance in all departments in the autumn of 1915 was 2191. The teaching force numbered 98, and the library contains 45,485 volumes and 19,075 pamphlets. The property of the university was valued in 1915 at \$1,255,000, and the gross annual income at \$245,000. The president in 1916 was J. F. Kingsbury, D.S.

UTAH LAKE. The largest fresh-water lake in Utah, situated 30 miles southeast of the Great Salt Lake, into which it discharges through the river Jordan (Map: Utah, C 2). It is about 21 miles long, and its maximum width is about 11 miles, made by an extension to the east. Elsewhere its average width is about 5 miles. It lies on the extreme eastern border of the Great American Basin, at the western base of the Wasatch Range, and at an altitude of 4489 feet. It receives its principal drainage from the east.

UTAKAMAND. See OOTACAMAND.

UTAMARO, ū'tā-mā'rō, KITAGAWA (1753-54-1806). A Japanese engraver and designer of color prints. He was born at Kawagoye (Province of Musachi), and studied at Yedo (now Tokio) under the painter Toriyama Sekiyen and at the school of Kano. In 1776 he published his first book of woodcuts and about 1780 his first colored album. His fame spread rapidly, reaching as far as Holland, and he employed many assistants. Utamaro's work includes illustrations for poems and romances, landscapes, shells, insects, animals, and scenes from popular life, but his favorite subjects were women. He created a new fascinating type, but in his portrayal of courtesans and professional beauties followed the erotic tendency of his Japanese contemporaries. Among his most famous series are "The Twelve Hours of the Green Houses" (1804) and "Yamauba and Kintoki." His prints, which show an astonishing variety of technique, are characterized by subtlety of line, animated composition, and delicate transparent color. They are well represented in the Metropolitan Museum, New York. An excellent exhibition of his work was held at the Musée des Arts Décoratifs, Paris, in 1912. Consult the catalogue of this exhibition, compiled by Vignier and Tnada (Paris, 1912), also the monographs by Kurt (Leipzig, 1907) and Goncourt (Paris, 1911).

UTE, ūt, or U'TAH. An important tribe of Shoshonean stock (q.v.), who formerly occupied the mountain region of western Colorado and

eastern Utah, with portions of the adjacent territory on the north and south, and extended their hunting and raiding expeditions far down into the plains. They were subdivided into bands, of which the principal were the Tabequache, Muache, Capote, Wiminuche, Yampa, and Uinta. They seem to have been the original nucleus of the Shoshonean stock, as commonly recognized, occupying a central position and having no tradition of any earlier home. They were usually at peace with their neighbors and kindred on the north and west, the Shoshoni, Banak, and Piute, and also assumed a protectorship over the Jicarilla, but carried on constant and relentless warfare with the Navajo and with all the tribes of the plains. They were a restless, warlike, and aggressive people, living entirely by hunting and on wild fruits and roots, and, like other tribes of the same stock, were democratic in their tribal life, with centralized or hereditary chiefship and careless of ceremonial. Their native arts were simple, but by trade with the Navajo and Piute they obtained blankets and baskets, while from the Mexicans and by raids on other tribes they procured herds of horses, sheep, and cattle. Their ordinary dwelling was a brush shelter or small tepee. The Ute made their first treaty with the government in 1850, and by various subsequent treaties were limited in range until the entire body, with the exception of the southern Ute, were removed to the present reservation in Utah. In the fall of 1906 the latter left their reserve and moved up to the headwaters of the South Fork of the Platte, refusing to return. As they were armed, a force of cavalry was sent out to force them back. When surrounded the Utes agreed to go to Fort Mead, S. Dak., to await orders from the Indian Department. They claimed that they could not live upon their reserve under the conditions imposed by the officials, and proposed to emigrate to the Big Horn valley. Later they returned to their reservation. In 1910 the total number of Utes was 12,244. See Plate of AMERICAN INDIANS, under INDIANS.

UTERUS (Lat., womb), or **WOMB**. A flattened, pear-shaped organ, lying behind the symphysis of the pubes in the human female, and constituting her principal generative organ. It consists of a body, a base or fundus, a neck or cervix, and a mouth. It lies in the line of the axis of the outlet of the pelvis (q.v.), with base directed upward and forward, and the neck directed slightly backward. In the unimpregnated condition it is about three inches in length, two in breadth, and one in thickness. Its walls are nearly half an inch thick, and are mainly composed of muscle fibres running irregularly in all directions except round the os, where they make a partial sphincter. This muscular coat, which constitutes the bulk of the organ, is covered externally with a serous coat, derived from the peritoneum, and is lined internally by a mucous coat continuous with that of the canal called the vagina, by which the interior of the womb communicates with the outer surface of the body. The neck or cervix is distinguished from the body by a well-marked constriction. The mouth or os projects into the vagina. This opening is nearly round in the virgin and transverse after parturition. It is of considerable size, and is named the *os uteri externum*; it leads into a narrow canal which terminates at the upper end of the cervix in a smaller opening, the *os internum*, beyond which is the shallow

triangular cavity of the womb, of which it forms the lower angle, while the two upper angles, which are funnel-shaped, constitute the beginning of the Fallopian tubes or oviducts, whose apertures are so small as only to admit the passage of a fine bristle. The blood vessels and nerves enlarge in a very remarkable way during pregnancy, so as to adapt themselves to the increased wants of the organ, which at the ninth

1, uterus and broad ligament as seen from behind, the latter being spread out. The isthmus tubæ, the utero-ovarian ligament, and the round ligament of the left side have been cut short. 2, sectional diagram of the uterine cavity as seen from the front.

month of uterogestation weighs from 2 to 4 pounds. The name "uterine appendages" or "adnexa" is given to the Fallopian tubes and ovaries, which are inclosed by the lateral folds of the peritoneum called the broad ligaments. The uterus is suspended in the pelvic cavity in such a way as, by its mobility, to escape concussion from without or disturbance from the varying conditions of the surrounding viscera, while at the same time to allow of its vastly increasing in bulk with comparatively little discomfort when pregnancy occurs. This is effected by several reduplications of peritoneum, known as the broad, the round, the uterosacral, and the utero-vesical ligaments.

The chief functions of the uterus relate to menstruation (q.v.), insemination, gestation, and parturition. See EMBRYOLOGY; FŒTUS; OBSTETRICS; OVARY; STERILITY; UTERUS, DISEASES OF THE.

UTERUS, DISEASES OF THE. The causes of uterine disease may be divided into those which are operative before marriage, those which arise during married life, and those which depend upon childbearing or its sequels. These causes thus embrace neglect of out-of-door life and physical development; improper dress; imprudence during menstruation; excessive mental strain; the prevention of conception and the production of abortion; the neglect of precautions after childbirth or the failure to repair lacerations occurring during delivery; disease communicated during sexual intercourse; and habitual constipation. Utter disregard of weather or temperature during menstruation and a continuance of the nervous tension of study during this period are grave and undermining agencies. Too great activity after parturition in women heretofore unaccustomed to

physical labor interferes with the normal contraction of the enlarged uterus, a process requiring six weeks for its accomplishment. The modern obstetrician is prepared to close lacerations immediately after delivery, to complete the surgical repairs necessary, and to prevent infection through bleeding surfaces. A very fruitful source of uterine disease lies in the prevention of conception and the procurement of abortion. Retention of fetal membranes, hemorrhage, septicæmia, peritonitis, are common and often fatal consequences. Gonorrhœa (q.v.) is a frequent and dangerous cause of uterine disease.

Endometritis is an inflammation of the mucous lining of the uterus, and may be confined either to the neck or the body of the organ or may affect both. It may be set up by exposure, injury, infection from the vagina (notably gonorrhœal), retained fetal membranes, and many other causes. Its symptoms are pain, weight, and oppression in the pelvic cavity and in the back, and an irritating leucorrhœal discharge.

Chronic metritis or hyperplasia is often coincident with endometritis and gives rise to similar symptoms. The pathological condition present is an enlargement of the uterine walls through increase of connective tissue.

Laceration of the cervix of the uterus consists of a tearing in the wall of the neck of the organ during labor. It gives rise to all the symptoms noted under endometritis, and sometimes to neuralgic pains in the uterine region and discomfort in walking. It may be unavoidable during delivery, and most frequently occurs as a result of precipitate labor, or manual or instrumental delivery. It is a frequent cause of lifelong suffering and distress, which operative interference, in the vast majority of cases, relieves at once.

Displacement of the uterus, while not a disease, gives rise to diseased conditions of much moment, by preventing the escape of menstrual blood, by interfering with the uterine circulation, by causing pressure and friction, and by producing sterility. The varieties of displacements are ante flexion, in which the uterus is bent forward upon itself; anteversion, in which the whole uterus is tilted forward; retroversion, in which the uterus is tilted backward; retroflexion, in which the uterus is bent backward upon itself; lateroversion and lateroflexion, in which the uterus is tilted or bent upon itself sideways; inversion, in which the fundus of the uterus is turned partly or entirely inside out; and prolapsus, or descent, in which the uterine body slips downward, and even, in the worst degree, causes a protrusion of the cervix at the vulvar orifice.

Menorrhagia is a condition in which menstruation is profuse, and an actual hemorrhage occurs at the menstrual period. Metrorrhagia is the occurrence of profuse menstruation or of a hemorrhage from the uterus in the interval between menstrual periods.

Cancer of the uterus is fairly frequent. The symptoms are pain through the pelvis; tenderness upon walking or moving, or during coition; hemorrhage; discharge of a very offensive fluid from the uterus; pallor and loss of strength and flesh. The treatment is complete removal of the organ and its adnexa. Consult Kelly and Noble, *Gynecology and Abdominal Surgery* (Philadelphia, 1916).

UTHER. King of Britain and father, by Igeria, of Arthur (q.v.).

UTICA (Lat., from Gk. *Ὀὐτική*, *Outikē*, *Ἰρική*,

Itykē). An ancient city of Africa, at the northwest extremity of the Gulf of Tunis, and about 20 miles from the city of Tunis. It was one of the oldest Phœnician settlements on the African coast, though the traditional date of its foundation (about 1100 B.C.) seems to rest on no good evidence. Like the other Phœnician cities, it acknowledged the supremacy of the Carthaginians, though its position was rather that of ally than subject. It was captured by Agathocles (q.v.) in his invasion of Africa at the beginning of the third century B.C., and played an important part in the Punic Wars. Early submission to Rome in the Third Punic War was rewarded with a large share of Carthaginian territory. In the war between Cæsar and Pompeius it became famous as a rallying point of the Pompeians after the battle of Pharsalus, being occupied by Cato. At Utica Cato committed suicide after Cæsar's victory at Thapsus. Utica became a free city under Cæsar and it received further privileges from Augustus. It was destroyed by the Arabs towards the end of the seventh century. The few ruins visible above ground lie west of the river known to the ancients as Bagradas. In 1869 A. Daux, a French engineer, made important excavations, by which he located the amphitheatre, capable of holding 20,000 spectators, the theatre, baths, reservoirs, the aqueduct, the fortifications, acropolis, quays, etc. (Consult A. Daux, *Le tour du monde*, 1872.) The site of the city was anciently on the shore about 27 Roman miles northwest of Carthage, but on account of changes in the coast line, caused by the river Bagradas, the spot is at present inland.

UTICA. A city and the county seat of Oneida Co., N. Y., 95 miles west by north of Albany, on the south bank of the Mohawk River, on the State Barge Canal, and on the New York Central, the New York, Ontario, and Western, the Delaware, Lackawanna, and Western, the Adirondack and St. Lawrence, and the West Shore railroads. It is also on the Utica and Mohawk Valley Electric Railroad (Map: New York, E 4). It is finely situated at an elevation of about 430 feet, and is regularly laid out. Noteworthy are the city hall, the courthouse, the United States Government building, the State Armory, the Munson-Williams Memorial, home of the Oneida Historical Society, the Young Men's Christian Association building, the Young Women's Christian Association building, the high school, the Savings Bank of Utica, the Utica Free Academy, and the State Masonic Home. The public library has 84,000 volumes. Other collections include the Oneida Historical Society Library, with more than 7200 volumes, the Utica Law Library, the Utica State Hospital Medical Library, the Young Men's Christian Association Library, the East Utica Library, the Deutscher Leserverein, and the Faxton Hall Library. Utica has been termed "the city of charities" because of the number of its charitable institutions, the value of their property, and the large amount annually expended for their maintenance. The more important of these institutions include the Home for the Homeless, Home for Aged Men and Couples, Utica Orphan Asylum, St. Vincent's Industrial School, St. John's Orphan Asylum, House of the Good Shepherd, and the City, Homœopathic, Faxton's, St. Luke's, and St. Elizabeth's hospitals. A State lunatic asylum also is here.

Utica is of considerable prominence as a com-

mercantile and industrial centre. It is in a rich dairy-farming country and is widely known for its large output of cheese. Hop growing and the cultivation of roses are other important industries of the surrounding district. In manufacturing Utica ranks eighth among the cities of the State, its various industrial establishments according to the 1914 census having \$30,762,000 invested capital and a production valued at \$30,490,000. There were 306 establishments, employing 14,368 persons. The leading manufactures are men's clothing, hosiery and knit goods, cotton and woolen goods, steam fittings and heating apparatus, foundry and machine-shop products, malt liquors, lumber products, firearms, metal beds, cutlery, farm implements, paints, fire extinguishers, automobile parts, office furniture, and saddlery and harness. For maintenance and operation the city spends annually about \$1,510,000. The chief items are: schools, \$422,000; fire department, \$178,000; police department, \$87,000; interest on debt, \$90,000; street lighting, \$81,000; street cleaning, \$63,000. The net debt in 1915 was \$2,400,000; and the assessed valuation of property (real and personal) was \$51,000,000. Pop., 1820, 2972; 1880, 33,914; 1900, 56,383; 1910, 74,419; 1915 (State census), 80,589; 1920, 94,156.

Utica was settled about 1786 on the site of Fort Schuyler. Until 1798, when it was incorporated as a town under its present name, Utica was known as "Old Fort Schuyler." It received a city charter in 1832. Its growth was slow until after the completion of the Erie Canal in 1825. Consult: Bagg (editor), *Memorial History of Utica* (Syracuse, 1892); and Brown, Butcher, and Goodale, *Outline History of Utica and Vicinity* (Utica, 1900).

UTIEL, ū-tē-äl'. A town of Valencia, Spain, 45 miles west of the city of Valencia. The principal manufactures are wine, brandy, silk and linen fabrics, and pottery. Municipal pop., 1900, 11,560; 1910, 11,777.

UTILITARIANISM (from *utilitarian*, from *utility*, from Lat. *utilitas*, usefulness, profit, from *utilis*, useful, from *uti*, to use). The name of the theory of ethics (q.v.) that adopts, as the criterion of right and wrong, of good and bad, the tendency of an action to produce the greatest happiness of the greatest number. John Stuart Mill claims to have coined the word, which was suggested to him by the use of the term "utilitarian" in Galt's *Annals of the Parish*.

The doctrine of utility is generally opposed to all those theories that refer us to some internal sense, feeling, or sentiment, for the test of right and wrong; a test usually described by such phrases as a moral sense, conscience, innate moral distinctions, whence utility is sometimes termed the external or objective standard of morality. It is also opposed to the view that founds moral distinctions on the mere arbitrary will of God. Again, it is opposed to the view that the pleasure-giving value of an act to the agent is the test of its goodness or badness (individualistic hedonism).

The utilitarian theory is distinctively a modern theory. All ancient hedonisms were more or less individualistic; i.e., the happiness of the agent and not that of his fellow beings was regarded as the ultimate end of all rational action. This is true even of Christianity in so far as it is hedonistic, for the ultimate appeal in Christianity is to the individual's desire for everlasting happiness, although along with this ap-

peal is another to a benevolent desire for the happiness of one's neighbors. In the Greek hedonistic systems whatever regard is paid to the well being of others is in the last analysis based on the fact that such consideration for others brings pleasure to one's self. In modern times Hobbes is the foremost representative of this ancient or individualistic hedonism. Hutcheson (q.v.) is perhaps the first writer on ethics who advocated the principle of the greatest happiness of the greatest number, in this way transcending the limitations of egoism (q.v.). There are utilitarian tendencies in Hume (q.v.) and even in Locke. Abraham Tucker (q.v.) is also to be mentioned as one of the early Utilitarians (1705-74). But Paley (q.v.) and Bentham (q.v.), especially the latter, are to be credited with giving such popular expression to this view that it became current in all centres of English thought. In Paley, however, utilitarianism was combined with theological authoritarianism and with individualistic hedonism, as is shown in his notorious definition of virtue as "the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness." With Bentham the theory was used as a foundation, not merely of ethics, but also of political and legal reforms. Having in view the necessity of sacrificing smaller interests to greater, or, at all events, of not sacrificing greater interests to smaller, he described the ethical end as "the greatest happiness of the greatest number." He illustrated the doctrine by setting it in opposition to asceticism, and to sympathy and antipathy. Asceticism he interpreted to mean the principle that pleasure should be forfeited, and pain incurred, without expectation of any compensation. By the principle of sympathy and antipathy he means "the principle which approves or disapproves of certain actions, not on account of their tending to augment the happiness, nor yet on account of their tending to diminish the happiness of the party whose interest is in question, but merely because a man finds himself disposed to approve or disapprove of them: holding up that approbation or disapprobation as a sufficient reason for itself, and disclaiming the necessity of looking out for any extrinsic ground." According to the utility principle of Bentham, there are "four sanctions or sources of pain and pleasure," the physical, the political, the moral, and the religious. The physical sanction is the groundwork of all the others. "In a word, the powers of nature may operate of themselves; but neither the magistrate, nor men at large, can operate, nor is God in the case in question supposed to operate, but through the powers of nature." Bentham attempted to work out a calculus of pleasures, in which he took account of the intensity, the duration, the certainty, the propinquity or remoteness, the fecundity (= "chance of being followed by sensations of the same kind"), the purity, and the extent of pleasures and pain.

John Austin, in his *Province of Jurisprudence Determined*, has contributed a lucid exposition and a strong defense of the principle of utility. John Stuart Mill has devoted a separate work to the subject, and may be considered as the ablest champion of the doctrine since Bentham's time. His addition to the theory consists in recognizing a distinction of quality as well as of intensity between pleasures. While Bentham had maintained that, "the quality of pleasure be-

ing equal, push-pin is as good as poetry," Mill contended that "it is better to be a human being dissatisfied than a pig satisfied," i.e., human discontent is better than swinish pleasures. Since Mill's day utilitarianism has been combined with the theory of evolution to form a basis for morality. Among the English advocates of the combination the best known are Herbert Spencer (q.v.) and Sir Leslie Stephen (q.v.).

The objections urged against hedonism (q.v.) in general bear against utilitarianism. In addition there are arguments which tell against utilitarianism exclusively. Utilitarianism is not practicable for the reason that it is impossible to estimate the pleasures which in the long run will flow from any course of action. Human nature changes very radically in its capacity to get pleasures from certain objects. Time was when the cruel torturing of a captured enemy brought intense delight to a whole tribe, and was regarded with complete indifference by the rest of mankind, with the exception of the victim's fellow-tribesmen. Now such treatment of captives would shock all Christendom. Many jokes and jests that centuries ago were appreciated with great relish would fall flat now in good society, and some of them would inflict considerable discomfort upon the hearers. Gladiatorial combats and bull fights are differently regarded at different times and places. These are only a few of the large number of instances which might be adduced to show how impossible it is to foresee the hedonic effect of actions when a distant future is taken into account. The uncertainties of calculation are great enough when only the pleasure of the agent is concerned (see HEDONISM), but if the pleasures of all mankind, present and future, so far as they are in any way affected by our actions, must be estimated before we can properly pronounce upon the morality of any act, then moral judgment becomes impracticable. The reply to this objection is that while there is no accurate forecasting of pleasures we must make the best estimates possible, or, to use the words of Bishop Butler, "probability is the guide of life."

Perhaps, however, the limitations of utilitarianism can be made most patent by asking the question, Why should I seek the greatest pleasure of the greatest number? Unless I desire that end for itself or desire it because the attainment of it conduces to some other desired end, it would be impossible to make me regard that end as good or the pursuit of it as right. The savage is not cosmopolitan in his ethics (hence he is not utilitarian), because he is not cosmopolitan in his sympathies. The normal civilized man is not uniformly cosmopolitan in his ethics (hence he is not a utilitarian), because he is not uniformly cosmopolitan in his sympathies. The average good man cares more for his father and mother, for his wife and children, than he does for strangers. For this reason he does not regard the happiness of a stranger as equally obligatory upon him to pursue as the happiness of some member of his immediate family. But when this ordinary man undergoes an unusual change of heart and comes to care more, say, for the opinion some supernatural being is supposed to have of him than for his own kith and kin, then in order to win that good opinion he may sacrifice the happiness of his family to that of strangers. It is

not true, therefore, that we should be benevolent because only thus can we secure the greatest happiness of the greatest number; but, on the contrary, we try to make "the greatest happiness of the greatest number" an end because we are benevolent. But our benevolence is only a part of our endowment, varying in relative intensity in different persons, and in the same person at different times. In addition to our desire for the well-being of others we have an almost countless number of desires for other objects. The realization of these desires enters into the question of the chief end of man. There is no reason why one desire should be singled out from the complex of desires in order that its realization may be considered the highest good of man—unless this desire is the most imperious of them all and its nonsatisfaction conduces more to the agent's discontent with life than any other cause. Now there is no question that without some social features the life of most human beings would be robbed of much of its attractiveness, but there is very little evidence to show that the ordinary man would be greatly disturbed for a long time by any failure on the part of humanity at large to get the greatest amount of happiness possible. And yet, though universal benevolence is not thus a very strong characteristic of our kind at large, still history seems to show that the reach of the average man's sympathetic interests is larger now than in tribal times. But, however much greater it may be now than formerly, free play given to one's impartially benevolent impulses can hardly be regarded as the highest good of all men.

UTILITY. A term used by economists to signify the capacity of a good, whether article or service, to satisfy a want. The utility of a good under given circumstances is subjectively measured by its desirability under those circumstances or by the strength of the desire for it. The term is sometimes used as synonymous with good, as anything which satisfies a want is a good or a utility. In such a statement no question of moral values is raised; regardless of whether a desire is morally good or bad, that which satisfies it has utility. The fact that the intensity of desire for a good decreases as the number of units of the good increases is known

as the law or principle of diminishing utility. Thus a second unit has less utility than the first, the third less than the second, and so on. The total utility then is the sum of the utilities of the successive units of the supply. But paradoxical as it may appear, this does not prevent the units of supply under specific and unchanging circumstances from being interchangeable and therefore equal to each other in utility, for though thus interchangeable the law of diminishing utility still applies to their consumption. The utility attaching to the last unit purchased under given circumstances is known as the marginal utility. See **VALUE**.

UTMA. The ancient name of the Italian city Udine (q.v.).

UTOPIA (Neo-Lat., from Gk. *ὄψ, ou*, not + *τόπος, topos*, place). An impracticable scheme of social regeneration, an imaginary state of society, an ideal country where all things are perfect. The term as thus used goes back to the *Utopia* of Sir Thomas More (q.v.), a political romance descriptive of a happy society on an imaginary island. This work originally appeared in Latin at Louvain in 1516 under the title *De Optimo Reipublicae Statu deque Nova Insula Utopia* and was translated into English by Bishop Burnet. The romance was a disguised exposition of a liberal and rationalistic theory of society, including certain principles that would now be called socialistic. Far from being so unique that it might have been expected to give a generic name to ideal commonwealths, the *Utopia* is only one of a long series of similar dreams. First in order of both time and importance is Plato's *Republic*, the chief thought of which is that ideal justice can be established only in a commonwealth where every individual has that place in the division of labor for which he is fitted by nature, and where all affairs are directed by the men of superior wisdom, whose government should extend even to provision for the nurture and education of children brought into the world under a system of stirpiculture. Plutarch's *Life of Lycurgus* idealizes the socialistic state of the Spartans. Bacon's *New Atlantis* (1624-29) pictures a commonwealth in which all men attain happiness through a regulation of life by science. Campanella's *City of the Sun* (1637) portrays a community where all live together in public buildings, working only four hours a day, and despising idleness. Very different in its ideal of society is James Harrington's *Oceana* (1656), a book which emphasizes the Aristotelian idea of a natural aristocracy among men, and develops fully the thought of personal liberty established under parliamentary government. It exercised a great influence upon the minds of American political thinkers during and after the Revolution. Other Utopias more or less influential have been the *Voyage en Salente* in Fénelon's *Télémaque*; Cabet's *Voyage en Icarie* (1840), a Utopia of the modern proletariat; Bulwer Lytton's *The Coming Race* (1871); Bellamy's *Looking Backward* (1889); William Morris's *News from Nowhere* (1890), in which joy in beautiful work is to be the true social bond; and Hertzka's *Freiland* (1891). Some of the more important works mentioned, excepting Plato's *Republic*, and the nineteenth-century romances, are reprinted in Morley's *Ideal Commonwealths* (1886).

UTRAQUISTS (from Lat. *utraque*, nom. pl. neut. of *uterque*, both, either). The name given to certain reformers of the early fifteenth cen-

tury, who maintained that the Eucharist should be administered "under both forms," i.e., that the cup, as well as the wafers, should be given to the laity. The movement was a part of the general reform preached by John Huss (q.v.; see **HUSSITES**) in Bohemia; it also had political features. The Utraquists represented the moderates, against the radical Taborites, and were identical with the Calixtines (q.v.).

UTRECHT, ŭ'trĕkt, Dutch pron. ŭ'trĕkt. A province of the Netherlands, bounded by the Zuider Zee and the provinces of North Holland, Gelderland, and South Holland (Map: Netherlands, D 2). Area, 534 square miles. It lies mainly in the Rhine basin and has a low, level surface. Agriculture, dairying, and cattle breeding are the principal industries. Pop., 1909, 289,918; 1912, 298,367. Capital, Utrecht (q.v.).

UTRECHT. A city of the Netherlands, capital of the province of the same name. It is situated 22 miles by rail southeast of Amsterdam (Map: Netherlands, D 2). The Rhine separates here into the Old Rhine and the canalized Vecht, and there are also canals traversing the city. Utrecht is a strong outpost of defense for Amsterdam. Besides an inner line of defensive works there is an outlying chain of forts. The site of the former fortifications surrounding the city are (since 1830) lined by water courses and agreeable promenades. Quaint houses and artistic street scenes are to be seen at every hand, the Gothic being freely in evidence. The famous Gothic cathedral of St. Martin (1254-67), rising in the centre of the town, is the most prominent edifice, and marks the spot where the church of Dagobert and of St. Willibrord stood. It ranked high for architectural beauty until the nave, which has never been restored, fell in in 1674 as the result of a storm, thus separating the tower from the rest of the church. The tower, 338 feet high, was begun in 1321. It has a chime of 42 bells. The graceful Gothic cloisters which merit notice connect the cathedral with the famous university. (See **UTRECHT, UNIVERSITY OF**.) The Roman Catholic cathedral of St. Catharine, which has been restored, dates from 1524. The Pope's house, built in 1517 by Adrian Boeyens, afterward Adrian VI, a native of Utrecht, now contains municipal offices. The splendid archiepiscopal museum is noteworthy for its rare vestments, embroideries, carvings, etc., all representative of Christian art. The Museum Kunstliefde is in the building of the Society of Arts and Sciences, and contains a few notable pictures by Scovel. The art industrial Museum van Kunstnyverheid, the Fishers' Hall (1637), and the mint possess some interest. On the east extends the Maliebaan—a triple boulevard shaded by six rows of large old lime trees. It leads to Hoogeland Park, and to the Antiquarian Museum, which is housed in an edifice of Greek pattern. The museum contains many varieties of antiquities belonging to Roman, Germanic, and mediæval times. The interesting royal Château of Soestdyk, where the reigning family often sojourns, is a few miles to the north.

Besides the university with its numerous collateral institutions, including laboratories and a museum, Utrecht has the only veterinary school in the Netherlands, and an important meteorological observatory. The Historical Society and the Society of Arts and Sciences hold a leading rank. The large university library

is in the palace erected for King Louis Napoleon. The military hospital was founded by Napoleon I. Utrecht has manufactures of cloth, woollens, silk, velvet, carpets, carriages, organs, cigars, chemicals, etc. The communal population at the end of 1912 was 122,853. About one-third of the inhabitants are Catholics. In addition to the Roman Catholic archbishop, Utrecht is the seat of an old Catholic (Jansenist) archbishop.

History. Utrecht was the Roman *Trajectum ad Rhenum*. The bishopric of Utrecht, founded at the close of the seventh century by St. Willibrord, rose to importance under the patronage of the German emperors, and the bishops became prominent in their capacity as temporal princes among the feudal lords of the Holy Roman Empire. The city of Utrecht, having become very flourishing, succeeded in emancipating itself from the rule of the bishops. In 1528 the bishopric and city passed into the possession of the Emperor Charles V. In 1559 the see was elevated to the rank of an archbishopric. The Union of Utrecht, a compact joining together the seven provinces which were to form the Dutch Republic, was concluded in 1579. The famous Treaty of Utrecht, terminating the War of the Spanish Succession, was signed here in 1713. Consult Karl Hegel, *Städte und Gilden der Germanischen Völker*, vol. ii (Leipzig, 1891).

UTRECHT, PEACE OF. The general designation for a number of treaties which were concluded between the years 1713 and 1715 and brought to an end the War of the Spanish Succession. (See SUCCESSION WARS.) On April 13, 1713, peace was signed at Utrecht between France on the one hand and England, Holland, Prussia, Savoy, and Portugal on the other. Spain concluded treaties with England July 13, with Savoy August 13, with Holland June 26, 1714, and with Portugal Feb. 6, 1715. The treaty between France and Austria was signed at Rastadt March 7, 1714, and this was adhered to by the Empire at Baden in September. The most important provisions of the various treaties were as follows: Philip V, of the house of Bourbon, was recognized as King of Spain and the Indies, but it was stipulated that the crowns of Spain and France should never be united in the same person. Spain ceded to the Emperor, Naples, Milan, Sardinia, and the Netherlands; to England, Gibraltar and Minorca; to Savoy, the island of Sicily; to Prussia, Upper Gelderland. France surrendered its hold on Lorraine and gave up Kehl, Breisach, and Freiburg on the right bank of the Rhine, but retained Alsace with Strassburg. To England it ceded Acadia, Hudson's Bay, and Newfoundland, with the reservation of certain rights of fishery on the Banks. Louis XIV recognized the title of the house of Hanover to the English throne, and agreed to expel the Pretender from France. The Electors of Cologne and Bavaria, allies of France, were restored to their possessions. The Dutch were given the right of garrisoning eight frontier towns in the Austrian Netherlands as a barrier against any future aggressions on the part of France. Their commercial interests were favored by the provision which kept the Scheldt closed to trade. The Prussian King received confirmation of his royal title and the Duke of Savoy was raised to the kingly dignity. (See SARDINIA. KINGDOM OF.) England, in addition to its conquests from France and Spain, received from both

valuable trading privileges, and in the so-called Assiento (q.v.) with the latter laid the basis of an extremely lucrative slave trade with Spanish America. The Peace of Utrecht effected the most important political rearrangement in Europe between the Peace of Westphalia and the Congress of Vienna. Though France received far more favorable terms than it might have been forced to accept, Europe was secured from its ambitions by the aggrandizement of its neighbors, Austria and Holland on the north, Prussia on the east, and Savoy on the southeast. With Utrecht the last two Powers definitely entered upon the line of development which was to result in a united Germany and a united Italy in the nineteenth century. From Utrecht dates England's marvelous commercial and colonial growth. Consult *Histoire du congrès et de la paix d'Utrecht comme aussi de celle de Rastatt et de Bade* (Utrecht, 1716).

UTRECHT, UNIVERSITY OF. A national university of the Netherlands, founded in 1636 upon the basis of a "schola illustris," established two years earlier by the city and province of Utrecht. During the French occupation in 1672 the university was closed. It was reopened in 1674 with only 22 students, which number, however, increased to about 230 by the early part of the eighteenth century. Nearly one-third of the students came from Great Britain. The university experienced another decline of fortune in 1811-13, as a result of the Napoleonic conquest, but has flourished since its reopening as a royal university in 1815. (For its place in the national system of education, see the section on the *Netherlands* under *UNIVERSITY*.) It is divided into five faculties— theology, law, medicine, mathematics and science, and letters—and had, in 1912-13, 1096 students. There are 21 laboratories and clinics, and an observatory, in connection with the university. The library contains about 250,000 volumes, exclusive of pamphlets and dissertations.

UTREBA, ū-trā'ra. A town of the Province of Seville, Spain, 17 miles southeast of the city of that name, with which it has railway connection (Map: Spain, C 4). The town is situated in a fertile plain sloping to the Guadaira River. It has manufactures of spirits, flour, and soap. Parts of its mediæval walls are still standing. Pop., 1900, 14,318; 1910, 15,460.

UTSUNOMIYA, ūt'su-nō-mē'ya. The capital of the Prefecture of Tochigi, Japan, 66 miles north of Tokio (Map: Japan, F 5). Pop., 1908, 47,114.

UTUADO, ū-twā'dō. A municipality of Porto Rico in the Province of Arecibo, 18 miles north-northwest of Ponce on the highway from Arecibo to Ponce (Map: Porto Rico, C 2). The city is situated in a district abounding with caves in which have been found relics of the early Indians. The cultivation of coffee and sugar cane is the chief industry. There is a municipal hospital and a public library. The municipality was founded in 1739. Pop., 1910, 41,054.

UVALDE, ū-vā'dē. A town and the county seat of Uvalde Co., Texas, 91 miles by rail southwest of San Antonio, on the Leona River, and on the Galveston, Harrisburg, and San Antonio and the San Antonio, Uvalde, and Gulf railroads (Map: Texas, C 5). Fort Inge, an army post of Indian days, is 2 miles distant. Pop., 1900, 1889; 1910, 3998.

UVAROVITE, ū-vā'rōf-īt. See GARNET.

UVA URSI. BEARBERRY. A plant indigenous to the Northern Hemisphere, growing in dry rocky places and found in the eastern United States as far south as Pennsylvania, and in New Mexico and California. Its botanical name is *Arctostaphylos uva-ursi*, of the natural order Ericaceæ. The leaves are used in medicine in the form of an extract and fluidextract, as a diuretic, astringent, and disinfectant to the urinary mucous membranes. It is given in pyelitis, cystitis, and gonorrhœa, and also in dropsical conditions. The chief constituents of uva ursi are arbutin and ericolin, bitter glucosides, and ursone, tannic acid, and gallic acid.

UVÉDALE. See UDALL.

UVULA. See PALATE.

UX'BRIDGE. A town in Worcester Co., Mass., 19 miles south-southeast of Worcester, on the Blackstone River, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, D 4). It has granite quarries, and cotton, yarn, and woolen mills. Pop., 1900, 3599; 1910, 4671.

UYEDA, ūyā-dā. A town in the Prefecture of Nagano, Japan, situated in the central part of Hondo, 21 miles southeast of Nagano (Map: Japan, F 5). It manufactures chiefly silks. Pop., 1908, 23,838.

UYUK, ūy-ŭŭk'. A noted archæological site in Asia Minor. See EYUK.

UZ (Heb. 'us). The land of the patriarch Job, and probably also the name of his people. In Job i. 3 he is said to be one of the Bene Kedem, an Aramaic people living east of the Dead Sea and the Arabah (see KADMONITES). In Lam. iv. 21 the "land of Uz" appears as a synonym of Bath Edom, "the daughter of Edom." According to the colophon in the Greek version Job "lived in Ausitis in the borders of Idumæa and Arabia," and the same statement is found in the *Peregrinatio Sylviæ* and in a passage from Aristeas quoted by Eusebius (*Præp. Ev.*, ix, 25). Uz appears as the eponymous ancestor of an Aramaic tribe in Gen. x. 23 (oldest son of Aram), and in Gen. xxii. 21 (oldest son of Nahor, brother of Buz). The representation of Uz as a descendant of Seir (Gen. xxxvi. 28) probably indicates only that this Aramaic tribe lived in the territory of Mount Seir. The names and homes of the friends of Job point in the same direction. Eliphaz of Teman, a district in Edom, appears in Gen. xxxvi. 4 as a son of Esau. Bildad, the Shuhite, may be identical with Bedad, the father of Hadad, the third King of Edom (Gen. xxxvi. 35), and Shuah was regarded as an uncle of Sheba and Dedan (modern el Ula). Zophar, as the Greek text shows, was a son of Eliphaz (Gen. xxvi. 11, 15), and Na'amah is likely to be a transposition of Ma'an, rendered Minaean by the Greek. Elihu came from Buz, which is associated with Dedan and Teima in Jer. xxv. 23. If, as the Greek translator thinks, Job is identical with Jobab, the second King of Edom, Gen. xxxvi is clearly the quarry drawn upon in the Book of Job, and the land of Uz is a part of the ancient Edomitish territory, easily exposed to raids from the city of Sheba and by the Aramaic tribe Kesed. Josephus speaks of Ouses as the founder of Trachonitis and Damascus (*Ant.*, i, 6, 4); Arabic geographers localized the city of Job at Nawa, and his house, Der Ayyub, not far from Nawa; and this region has also been assumed to be the home of Job by Wetzstein and Barton. But Dhorme has convincingly shown that this

implies a transfer of the story from the Edomitish Dinhaba, the city of Jobab, to the Dinhaba of the Hauran. The mistaken notion that there could be no Aramaean tribes as far south as in the region occupied by the Aramaic-speaking Nabataeans probably also had something to do with this change. Consult: P. J. G. Wetzstein, in Franz Delitzsch, *Hioh* (2d ed., Leipzig, 1876); also references under Uz (article following).

UZ (Heb. 'us). 1. The eponymous ancestor of an Aramaic tribe, represented as the oldest son of Aram in Gen. x. 23, as the oldest son of Nahor and brother of Buz in Gen. xxii. 21. In Gen. xxxvi. 28 Uz is a descendant of Seir; this statement possibly affirms that the Aramaean tribe occupied a part of the territory of the Horites, or cave dwellers, in Mount Seir. Buz is mentioned with Dedan and Teima in Jer. xxv. 23; Dedan is apparently the modern el Ula; Teima still exists in the same neighborhood; Buz, therefore, is likely to have been in northern Hejaz; and Uz seems to have been an Aramaean tribe in the border of Edom and Hejaz. 2. The home of Job (i. 1). He is said to be one of the Bene Kedem. The Kedem tribe, or Kadmonites (q.v.), lived east of the Dead Sea and the Arabah, and were Arameans. Eliphaz, the friend of Job, came from Teman in S. Edom; Bildad, another friend, from Suah, who appears as an uncle of Sheba and Dedan; Zophar, the third friend, from Na'amah, or Ma'an (in Greek Minacan); and Elihu from Buz. It is also to be noted that Eliphaz appears in Gen. xxxvi. 4, as a son of Esau; Zophar in Gen. xxxvi. 11, 15, according to the Greek version, as a son of Eliphaz; and Bildad apparently, in the abbreviated form Bedad, as the father of Adad, King of Edom, in Gen. xxxv. 35. In the Greek version Job is said to have lived in Ausitis in the border of Idumæa and Arabia; the same statement is found in the *Peregrinatio Sylviæ*, and in a passage from Aristeas quoted by Eusebius. The idea that the Arameans lived farther north probably led Josephus to speak of Ouses as the founder of Damascus and Trachonitis, and Arabic geographers to localize the city of Job at Nawa, and the house of Job not far from there. Barton assumes that neither Sabaeans nor the Chaldeans originally occurred in the text, but only "captors" and "horsemen," and that Uz was in the Hauran; Dhorme more plausibly thinks of the city of Sheba and the tribe of Kesed as the enemies falling upon Job's property and locates Job on the borders of Edom and Arabia. It is not improbable that the land of Uz was the territory in this region occupied by the Aramaic tribe of Uz. Consult: P. Dhorme, "Le pays de Job" in *Revue Biblique Internationale* (Paris, 1911); Nathaniel Schmidt, in *Messages of the Poets* (New York, 1911); G. A. Barton, "The Original Home of the Story of Job," in *Journal of Biblical Literature* (Boston, 1912).

UZ, ūts, JOHANN PETER (1720-96). A German poet, born at Ansbach and educated at Halle, where he became the friend of Gleim and Götze. He was in his day prominent in the group of German anacreontic poets. His works include *Sieg des Liebesgottes* (1753), *Versuch über die Kunst stets fröhlich zu sein* (1760), and *Poetische Schriften* (1804). Consult: Feuerbach, *Uz, ein biographischer Versuch* (Leipzig, 1866); Henneberger, *Briefe von Uz an einen Freund aus 1753-1782* (Leipzig, 1866); Petzet, *Johann Peter Uz* (Ansbach, 1896).

UZANNE, u'zàn' (LOUIS) OCTAVE (1852-). A French bibliophile and littérateur, born at Auxerre. He founded the monthly review *Le Livre*, which he edited (1880-89), and then *L'Art et les Idées* (1892). He was one of the original members of the Society of Contemporary Bibliographers established in 1889. His best work includes: *Caprices d'un bibliophile* (1877); *La chronique libertine du XVIIIe siècle* (1879-83); *Les zigzags d'un curieux* (1889); *Notes pour la bibliographie du XIXe siècle* (1894); *Contes pour les bibliophiles* (1895); *Dictionnaire bibliophilosophique* (1896); *L'Art dans la décoration extérieure des livres en France et à l'étranger* (1898); *L'Art et les artifices de la beauté* (1902); *Les deux Canaletto, biographie critique* (1907); *L'Egypte contemporaine* (1909); *Parisiennes de ce temps* (1910); *Le célibat de l'amour* (1912).

UZ'BEKS, or **US'BEGS**. A people of the Oxus basin in Russian Turkestan, scattered from the frontiers of the Chinese Empire to the Caspian. They are in part nomadic, but have settled in great numbers in the towns and villages. By language they belong to the Turkic stock, but they have a considerable strain of Iranian blood and possess many elements of Asiatic Aryan culture. The early home of the Uzbeks is generally considered to have been about the northern end of the Caspian Sea, whence they spread as conquerors in the sixteenth century over Balkh, Khiva, Bokhara, Ferghana, and Khokand.

UZENSK, Novo. See **NOVO-UZENSK**.

UZZIAH, ūz-zī'ā (Heb. 'Uzziyyāh or 'Uzziyyāhū, Yahwe is my strength), or **AZARIAH** (Heb. 'Azaryāh or 'Azaryāhū, Yahwe helps). A king of Judah, son of Amaziah (2 Kings xv. 1-7; 2 Chron. xxvi). The relation of the two names is uncertain. They may be practically synonyms, double names occurring in the Davidic line, or possibly one is a textual corruption of the other. Uzziah is assigned a reign of 52 years, but seems to have reigned himself only 40 (c.777-737 B.C.). The Book of Kings simply recounts his piety, and that he was smitten with leprosy in the latter part of his reign, his son Jotham becoming Regent. The Chronicler represents Uzziah as a successful warrior, subduing the Philistines, and driving back the Arabians and Ammonites, and so extending his boundaries southward. He added to the fortifications of Jerusalem, fortified the Negeb (q.v.), and zealously developed the royal domains. The stroke of leprosy is represented as due to the pride created by his success; he is said to have arrogated to himself the right to offer incense in the temple, and, when he persisted against the high priest, to have been stricken with the plague. Uzziah was the contemporary of Jeroboam II (q.v.) of Israel. Isaiah records that his prophetic vision came in the year Uzziah died. Consult the histories of Israel quoted in the article on **JEWS**.

UZZIEL, JONATHAN BEN. See **JONATHAN BEN UZZIEL**.

V

V The twenty-second letter and seventeenth consonant of the English alphabet. Its form corresponds to the Roman V, which answers to the Greek upsilon (Υ, υ), and that in turn was a variation of the Phœnician Ṽ (vau). (See ALPHABET.) In Latin *v* and *u* were used indifferently to represent either the consonantal or the vocalic sound. See U.

Sound and Philological Value. As a phonetic character *v* in modern English is a voiced labiodental spirant. Its corresponding voiceless character is *f*. The sound is produced by the breath passing between the lower lip pressed against the upper teeth. The philological sources of the letters are various. When not initial, Eng. *v* may represent (1) Indo-Ger. *bh*, as in Eng. *love*, Ger. *liebe*, Skt. *luh*, to desire; (2) Indo-Ger. *p*, as in Eng. *over*, Ger. *über*, Skt. *upari*. In a few words initial *v* in English represents Indo-Ger. *p* = AS. *f*, as in *vat*, AS. *fæt*; *vane*, AS. *fana*; *viwen*, AS. *fiwen*. In these cases *v* is due to the influence of the Southern English dialect which gave a voiced sound regularly to the older English *f*. Often initial *v* in English is a sign of a loan word from Latin or French, as in *villa*, *voice*, *vacation*.

As a Symbol and Abbreviation. V in chemistry = *vanadium*. In Roman numerals V = 5; Ṽ = 5000. *v* = Lat. *vidē*, see. See PHONETICS.

M. Thompson, *Introduction to Greek and Latin Palaeography* (London, 1912); W. M. Flinders Petrie, *The Formation of the Alphabet* (ib., 1912); Eduard Stucken, *Der Ursprung des Alphabets* (Leipzig, 1913).

VAAL, vāl (Dutch, yellow, a partial translation of the native name *Kai Gariep*, yellow river). The chief tributary of the Orange River in South Africa, regarded by some as the true upper course of the main stream. It rises on the west slope of the Drakensberg, flows west and southward on the boundary between the provinces of Transvaal and Orange Free State, and joins the Orange in the Province of the Cape of Good Hope after a course of between 500 and 600 miles (Map: Cape of Good Hope, J 6).

VĀC, or **VACH**, vāch (Skt., word, voice). In Hindu mythology, the personification of speech, later identified with Sarasvatī, the divine embodiment of eloquence and learning and wife of Brahma (q.v.). She is celebrated in one late

hymn of the Rig-Veda as the conferrer of life, wealth, and power on mortals. A later meteorological interpretation regards her as "the voice of the midair" or the thunder. Certain attempts have been made to compare Vac as "the divine word" with the Logos (q.v.), or Word of the Fourth Gospel, but any parallelism between them is due merely to accidental coincidence. Consult: Hopkins, *Religions of India* (Boston, 1895); id., *India Old and New* (New York, 1901); Macdonell, *Vedic Mythology* (Strassburg, 1897); Müller, *Six Systems of Indian Philosophy* (New York, 1899).

VACA, vā'kā, ALVAR NÚÑEZ CABEZA DE. See NÚÑEZ CABEZA DE VACA.

VACANDARD, vā'kān'dār', ELPIÈGE (1849-). A French Church historian. He was born at Melleville and became a priest and doctor of theology. He wrote: *Saint Bernard* (1877); *Abélard, sa lutte avec Saint Bernard* (1881); *Vie de Saint Bernard* (1895; new ed., 1910), crowned by the French Academy; *La confession sacramentelle dans l'église primitive* (1903); *L'Inquisition* (1907; Eng. trans., new ed., 1915); *Études de critique et d'histoire religieuse* (3 series, 1905-12).

VACARESCO, vā'kā-rēs'kō, ILELENE (ELENA VACARESCU) (1866-). A Rumanian poet and novelist. Born at Bucharest, she came of a family notable in letters since the middle of the eighteenth century. She received part of her education in Paris, and for a time, as maid of honor to Queen Elizabeth (Carmen Sylva); resided at the Rumanian court. After 1892 she lived mostly in Paris. Her *Chants d'aurore* (1886) was crowned by the French Academy, as was also *Le rhapsode de la Dâmbovitza* (1900), a collection of Rumanian folk songs translated into French. This appeared in an English translation by Carmen Sylva and A. Shettell as *The Bard of the Dimbovitza* (new ed., 1902). For *L'Amc sercine* (1896) she was awarded the Jules Favre prize by the French Academy. Her writings also include: *Lucurs et flammes* (1903); *Kings and Queens I Have Known* (1904); *Songs of the Valiant Voinode and Other Strange Folklore* (1905); *Le jardin passionné* (1908); *Amor vincit* (1909); *Royal Lovers: The Adventures of Two Emperresses* (1909).

VACATION SCHOOL. A term used, quite arbitrarily, to indicate a school kept in many American cities during the customary summer vacation for the children of the public schools. The term has no reference to the more advanced schools connected with universities and colleges or with popular educational institutions such as

the Chautauqua (q.v.), though the motive for the establishment of these more advanced schools may be much the same. The vacation school is of very recent establishment, save in a few isolated instances, and owes its origin to the work of philanthropic societies in caring for the children of the poor of the larger cities during the extreme heat of the summer. While there are sporadic instances of such schools kept by these societies as early as 1866, when the old First Church in Boston conducted one, and there are even some instances of school boards providing for such work, as in Newark, N. J., in the same year, the movement has become of importance only since 1898, when the Board of Education of the city of New York took over the schools primarily founded by the Society for the Improvement of the Condition of the Poor. During 1913-14 that city provided 213 play centres of different kinds and 36 vacation schools, the former with an average daily attendance of 140,168 and 27,107 at the latter. At the present time all the large cities of the country and many of the small ones, to the extent of some 200 in all, support such schools. The work of the vacation school is of a much more practical nature than that of the ordinary session and is devoted more to constructive work and organized play by the child. Consequently manual training, housekeeping, sewing, together with nature work, local history, and geography, combined with excursions, form a prominent part of the curriculum. During the last few years, however, work of more serious character has been introduced in the upper grades and in the high schools to enable backward pupils to catch up with their work, or more ambitious pupils to make more rapid progress. The idea of vacation schools is being fostered and has met with success in London through the efforts of Mrs. Humphry Ward. Consult C. A. Perry, *Wider Use of the School Plant* (New York, 1910).

VACCINATION (from *vaccine*, from Lat. *vaccinus*, relating to a cow, from *vacca*, cow; connected with Skt. *vaśā*, cow, from *vās*, to bel- low, or perhaps with *ukṣan*, bull). Inoculation with *vaccinia* or cowpox, to protect the individual against smallpox.

History. Many years before the time of Jenner it was observed in widely separated localities that accidental infection with cowpox conferred immunity against smallpox. Immermann quotes Von Humboldt as referring in his travels in the tropics (1803) to the fact that native shepherds in the Mexican Cordilleras believed in the protection afforded by *vaccinia* against smallpox, and quotes Brun as making a similar statement in reference to the clan of Elihots in Baluchistan. Peasants in different parts of Europe, especially in the southern part of England, in Holstein, Mecklenburg, Hanover, and Saxony were firmly convinced of the fact. It was known to most Oriental peoples, from whom the idea was introduced into England by the communications of Tinsoni and Pilarini to the Royal Society in 1713, and was taken up by Sir Hans Sloane four years later. In 1721 Lady Mary Montague had her five-year-old daughter inoculated in England, probably the first European to receive preventive vaccination, while Dr. Zabdiel Boylston inoculated his son and two negro slaves in Boston in the same year. In the smallpox epidemic in Boston in 1752, 2000 people were inoculated. In 1763 Dr. Heim, of Saxe-Meiningen, learned through his father, a

clergyman, that milkmaids of that country neighborhood asserted their belief in the protective influence of accidental *vaccinia* against variola. The English physicians Sutton and Fewster inoculated with human smallpox in 1764 nearly 20,000 people during an epidemic in England. Medical men paid but little heed to their reports, and apparently further experiments were not made by them. A Gloucestershire farmer, Benjamin Jesty, inoculated successfully his wife and two sons with bovine virus in 1774. It is further reported that Platt, a school teacher near Kiel, vaccinated two children with bovine virus to protect them from an epidemic of smallpox in 1791. But great and lasting credit is no less due to Edward Jenner (q.v.), who in 1778 began a thorough scientific investigation of the matter, and placed the performance of vaccination in its proper place among prophylactic procedures. His experiments were very numerous and accurate. The first mention of individuals occurs in the history of the inoculation on May 14, 1796, of the eight-year-old James Phipps with vaccine virus from a vesicle on the person of a milkmaid, Sarah Nelwes, who had accidentally acquired cowpox. This was probably the first vaccination of a patient with humanized virus of the first generation. A typical case of cowpox developed in Phipps, and subsequent attempted inoculation with smallpox virus proved negative. Jenner followed this experiment with an inoculation with bovine virus, and then inoculated from individual to individual for five generations, securing perfect immunity from smallpox in all patients and collecting data of 23 cases. When both facts were established he put forth his remarkable publication, *An Inquiry into the Causes and Effects of the Variolæ Vaccinæ, Known by the Name of the Cowpox* (1798). This work was translated into Latin and all the European languages, and excited much attention, as well as opposition. Vaccinations were frequent and numerous, and many representative and noted physicians declared themselves as advocates of the theory and practice, in England, France, Austria, Italy, Germany, Switzerland, Holland, Norway, Sweden, Russia, Spain, and Portugal, while others, especially in England, opposed him. Jenner founded, in 1803, the Royal Institute for the Extermination of Smallpox, which he directed for many years. Both institutions vaccinated people free of charge and supplied virus for other countries. To Luigi Sacco, a physician of Milan, is due credit, second only to Jenner's, for a life-long service in behalf of preventive vaccination, equine and ovine inoculation, and retro-inoculation. To Sacco the world owes the final adoption of animal (bovine) virus in place of humanized virus.

Statistics of the Utility of Vaccination. Statistics prove indubitably that a population vaccinated and revaccinated thoroughly can remain practically immune from smallpox. One of the earliest opportunities for proving, on a large scale, the value of vaccination, occurred during the pandemic of smallpox which raged in Europe from 1870 to 1873. The greater part of the German army had been vaccinated in childhood, and all of it again vaccinated upon entering service in the Franco-Prussian War. In the French army, regular vaccination had not been practiced, and revaccination had been neglected. The mortality in the German army was 450, or 58 men to every 100,000; in the

French army the mortality was 23,400. Statistics might be multiplied indefinitely, but they all show the same result. The experience of the United States health authorities in the Philippine Islands is another case in point. With the exception of an occasional sporadic outbreak, the islands have been free from smallpox since vaccination was enforced. In the United States and England epidemics have occurred from time to time, but in every instance they have been shown to be due to laxity in the enforcement of the law, or to opposition on the part of certain sections of the community.

Technique of Vaccination and Course of Vaccinia. Virus for vaccination should be procured from well-developed typical vaccine pocks on the abdomen of a healthy young heifer, while they are still in the vesicular stage. The virus may be received upon ivory points or removed entirely by scraping it from the underlying corium with a spoon, and rubbing this mass with glycerin. The resulting emulsion of pulp is much more active than the dried lymph. It is conveniently kept in sealed capillary tubes. Both the collection of virus and its application to the patient should be done under strict aseptic conditions. Usually the arm or leg is chosen for the place of vaccination, and should be thoroughly cleaned and disinfected. Two or three shallow scarifications are made with as many crossing them, the surgeon cutting as deeply as the derma without necessarily drawing blood. After the lymphatic fluid begins to flow from these incisions the vaccine virus is rubbed into the incisions. A sterilized toothpick flattened at one end is a convenient implement for this purpose. After drying thoroughly, the surface is covered with a layer of sterile gauze, which is to remain on for three days. In the course of three to seven days elevated papules appear, oval or oblong, over the scarifications. These papules are firm, hot, and tender. They are surrounded by a red halo or areola. About the fifth day after their appearance they become vesicles, containing clear fluid, which is vaccine lymph. When humanized virus was used, this was taken from the patient to be used in inoculating another case. These vesicles are called Jenner's vesicles, and somewhat resemble the vesicles of smallpox. Like them, also, they shrink and become umbilicated after the seventh or ninth day; the halo grows darker; pus takes the place of the lymph; pain, itching, swelling, and heat are troublesome. A slight reaction consisting of fever and malaise may take place on the fifth day. About the ninth or tenth day the pustule dries, and a crust forms. The areola fades. The axillary glands may enlarge at this time and are tender and painful on pressure. Children's symptoms are more pronounced than those of adults. The temperature during vaccinia reaches 102.5° F., and rarely runs higher. The crust separates from the arm in 14 days. If the crust be detached by scratching or the chafing of the clothing a second one forms. In all cases scrupulous care must be exercised lest the wound become infected with germs in dust or clothing, or under finger nails. Serious consequences follow such infection. The wound may be infected with erysipelas, or gangrenous inflammation may set in, causing a very large ulcer. These are not the results of the vaccination, but of subsequent infection; and the same results are often seen following any scratch with a needle or an abrasion upon the hand.

Danger of Vaccination. There is no danger in proper vaccination, if infection is avoided thereafter. All inflammatory reaction beyond that described as occurring in the course of regular vaccinia is due to the introduction of micro-organisms by means of dirty instruments or through the admission of dust. There is absolutely no danger of transmitting disease by means of bovine virus. When humanized virus was used there was some danger of transinoculating with syphilis or tuberculosis. Yet even this danger was remote. Tetanus has followed vaccination, not from the operation itself but from subsequent infection.

Compulsory Laws. Naturally, vaccination, in order to protect, must be universal. All foci from which the disease might spread must be destroyed, and immunity must be secured round about each focus. Every child should be vaccinated during its first year, and all adults from foreign countries should be vaccinated, unless they present sufficient evidence of successful protection previously. Several years after Jenner's discovery, public interest was aroused to a complete understanding of the necessity of compulsory vaccination. Bavaria established a law making vaccination compulsory in 1807. Other states of the North German Confederation followed, and between 1815 and 1832 similar statutes were enacted in Oldenburg, Baden, Württemberg, Saxe-Gotha, Saxe-Meiningen, and Brunswick. Austria in 1801 made vaccination compulsory for school children, but not generally so till 1886. In 1816 Prussia also enacted an indirectly compulsory law. Sweden's compulsory law was put upon the statute books about 1803. Norway and Denmark followed in 1810. After many vicissitudes and changes, Great Britain's law was enacted in 1867. Scotland put herself on record in 1864. Italy, Holland, and Belgium popularized vaccination very early and needed no law. France's decree of 1809 was inoperative and the country has suffered heavily from the want of a compulsory law. The German Empire framed the Imperial Vaccination Law in 1874, and its provisions deserve study and imitation. It provides: (1) Every child shall be vaccinated within the calendar year of its birth, unless it has passed through an attack of variola. (2) Every pupil shall be revaccinated when 12 years of age, if he has not had variola within the past five years. (3) Every vaccinated person must present himself to the physician who vaccinated him between the sixth and eighth day after vaccination. (4) Medical certificates proving successful vaccination at the legal ages shall be preserved by parents and guardians.

In the United States the laws regarding compulsory vaccination vary greatly in the different States. Vaccination is made compulsory by law only in Kentucky, the Philippine Islands, and Porto Rico. In Kentucky the law requires the vaccination of all children within 12 months after birth and all minors and adults are to be vaccinated. In the Philippine Islands every child, three months of age, must undergo vaccination and all inhabitants must be vaccinated as often as required by the health authorities. In Porto Rico the board of health requires that every person shall possess a certificate of vaccination. Massachusetts enacted laws to regulate vaccination in 1809. Several States followed the example early, notably Rhode Island. In most of the States local or State boards of health formulate regulations under which vaccination

is practically compulsory, acting in unison with school boards in excluding all unvaccinated children from the schools. In several of the United States the constitutionality of statutes making vaccination compulsory has been judicially settled. They are held to be a legitimate exercise of the police power for the protection of the public health. A physician who vaccinates a person without the latter's consent, but who is acting under the authority of such a statute or ordinance, is not liable for assault. For a fuller account of vaccination requirements in the United States, consult *THE INTERNATIONAL YEAR BOOK*, 1912.

In spite of the testimony received from all over the civilized world, antivaccinationists flourish in small bodies here and there. The antivaccination sentiment had become so strong in England, although confined to a small class, that a measure was adopted in 1898 practically annulling the compulsory vaccination bill of that country. The newer measure provides that any parent may refuse to have his child vaccinated and avoid legal penalty if he satisfies the court that he has conscientious scruples as to the benefits of vaccination. The agitation against vaccination has been constant since the days of Jenner. In his time it was claimed that the tendency of the inoculation of vaccinia was to cause bovine characteristics to appear in children; that they developed horns, hoofs, and tails, and bellowed like cattle. Less absurd but, in the opinion of leading medical authorities, equally untenable arguments are presented against vaccination to-day.

Revaccination. Jenner believed that the effect of vaccination was perennial; and this belief imperiled the progress of vaccination at one epoch in its history, for vaccinated persons, after several years of immunity, fell victims to smallpox. At one time the mystical number seven seemed to rule the mind, and vaccinia was said to last seven years. In fact, the duration of immunity conferred by vaccination is variable in different people. In a few cases, one vaccination protects for life, and cannot be successfully repeated. In others, a vaccination will take every time it is tried. A number of investigations as to the duration of immunity have thrown some light on the matter. These were based on the percentage of successful revaccinations. Kitasato of Tokyo found that revaccination was successful in 14 per cent after one year; 33 per cent after two years; 47 per cent after three years; 57 per cent after four years, and so on until 10 years was reached, when 89 per cent of the persons were successfully revaccinated and therefore had probably lost their immunity. Somewhat similar results were obtained by Lescohier of Detroit, in 500 cases. He found that 34 years after primary inoculation revaccination was practically always successful. King, in 1913, in observations made on Asiatics, found that in a series of 312 patients who had been vaccinated before 15 years of age, revaccination was successful in 80.3 per cent. It may be taken as a safe rule that immunity in a large percentage of persons is practically lost 10 years after primary vaccination and that it begins to diminish from the second year. See Cowpox.

Substitutes for Vaccination. It has been asserted from time to time by enthusiasts in sanitation that cleanliness and disinfection will control and prevent smallpox. This is an error.

Until the microorganism causing smallpox is discovered and its nature is known, no adequate prophylactic or disinfectant measures will supersede vaccination. Were primary vaccination and revaccination carefully practiced, smallpox would be entirely eradicated. See SMALLPOX.

VACCINATION FOR TYPHOID. See HYGIENE, *Military Hygiene*.

VAC'CINE THERAPY, BACTERIN THERAPY. Bacterial vaccines, as defined by Sir Almroth Wright (q.v.), are "sterilized and enumerated suspensions of bacteria which furnish, when they dissolve in the body, substances which stimulate the healthy tissues to a production of specific bacteriotropic substances which fasten upon and directly or indirectly contribute to the destruction of the corresponding bacteria."

The use of bacterial vaccines in combating diseases of bacterial origin is based on the principle that the injection of killed bacteria increases the bactericidal power of the blood by stimulating the production of antibodies, these in the main constituting the defensive mechanism of the body against zymotic diseases. The immunity which a vaccine confers differs from that given by a serum in being active instead of passive. The materials from which vaccines are prepared may be derived from various pathological fluids of the body which contain the offending organisms. Cultures may be made from the nasal secretion, from pus cavities, discharging ears, from sputum, from the urine, and from the blood. These specimens must be as nearly as possible uncontaminated by extraneous organisms. Cultures are made by spreading the material upon suitable media, preferably those containing blood or serum and having a solid consistency. The further process of preparing the vaccine consists in mixing the resultant culture (generally a 24-hour growth) with normal salt solution, to which is added a preservative, such as phenol, and agitating the emulsion to secure uniform mixture. A mechanical shaker is used for this purpose and from a half to one hour is necessary to complete emulsification. The mixture is standardized by means of an ordinary blood counter, so that a given number of bacteria, usually from 100,000,000 to 1,000,000,000, are contained in each cubic centimeter. Finally, the bacteria are killed by exposure to a temperature of 140° to 150° F. for about an hour. The vaccine is now drawn off into sterile glass containers and is then ready for use. Vaccines made directly from the secretions of a given patient are termed *autogenous* and are as a rule more efficacious than stock vaccines, these being cultures made from extraneous sources. Stock vaccines, however, particularly when polyvalent, i.e., containing several strains of the bacterium, are more generally used and give good results. Vaccines are administered by hypodermic injection, the skin being previously sterilized with alcohol or iodine. They are most effective in localized suppurating lesions of the skin, such as abscess, acne, furunculosis and carbuncle, es-

pecially when these are in a subacute or chronic state. They are also of value in deep-seated pus affections, such as pyelonephritis, cystitis, osteomyelitis, etc.; in specific affections of the joints, such as gonorrheal arthritis and in many affections of the eyes, ears, and nose. Tuberculin (q.v.) is discussed under its own title. Bacterin therapy is contraindicated in all diffuse infections characterized by septicæmia or pyæmia, and in severe acute diseases, such as pneumonia and typhoid fever, when the body is already overwhelmed by the bacterial invasion. In general the presence of fever is a contraindication. The prophylactic value of certain vaccines is well exemplified in typhoid fever (q.v.), where a very efficient degree of immunity is conferred by protective doses of antityphoid vaccine. See SERUM THERAPY; TUBERCULIN. Consult Gould and Pyle, *Cyclopedia of Medicine and Surgery* (Philadelphia, 1912), and J. A. Kolmer, *A Practical Text-Book of Infection, Immunity, and Specific Therapy* (ib., 1915).

VACCINOTHERAPY. See VACCINE THERAPY.

VACH, väch. See VÄC.

VACHELL, väch'el, HORACE ANNESLEY (1861-). An English novelist, educated at Harrow and at the Royal Military College, Sandhurst. His fiction includes, notably: *The Romance of Judge Ketchum* (1894); *Quicksands of Pactolus* (1896); *The Procession of Life* (1899); *John Charity* (1900); *The Pinch of Prosperity* (1903); *Brothers* (1904); *The Hill* (1905); *The Pace of Clay* (1906); *Her Son* (1907); *The Other Side* (1910); *John Verney* (1911); *Bunch Grass* (1912); *Quinn's* (1914); *Spragge's Canyon* (1914). *Her Son* and *Quinn's* were dramatized, the latter being produced in New York in 1915. Other plays by Vachell were *Searchlights* and *Lady Camber* (both 1915).

VACHEROT, vash'rô', ETIENNE (1809-97). A French philosopher, born at Langres and educated in Paris. In 1837 he was appointed superintendent of the Ecole Normale by Victor Cousin, his former teacher, whom he succeeded as professor of philosophy at the Sorbonne in 1839. His liberal views and especially the exposition of his philosophical doctrines in the *Histoire critique de l'école d'Alexandrie* (1846-51) aroused the violent opposition of the clergy. He was suspended from his position of superintendent and, after denying allegiance to the Empire in 1852, was deprived of his professorate. Judiciary proceedings and imprisonment resulted from the publication of *La démocratie* (1859). As mayor of the fifth arrondissement of Paris he rendered important services during the siege and the Commune and in 1871 was elected to the National Assembly, where he at first sided with the Liberals, but afterward joined the Centre and even lent his support to the Broglie ministry in its ultramontane aspirations. Although he withdrew from political life after the dissolution of the National Assembly, he continued to voice sensationally anti-Republican opinions in the *Revue des Deux Mondes*, the *Figaro*, and the *Soleil*. Besides his principal work, *La métaphysique et la science* (2d ed., 1863), containing the development of his philosophical system, he wrote *Essais de philosophie critique* (1864), *La religion* (1868), *La science et la conscience* (1870), *La politique catégorique de la république* (1881), *Le nouveau spiritualisme* (1884), *La démocratie libérale* (1892). For his biography, consult Ollé-Laprune (Paris, 1898).

VACOA. See SCREW PINE.

VACQUERIE, vâk'rê', AUGUSTE (1819-95). A French author and journalist, born at Villequier. He showed himself an ardent admirer of Hugo, and endeavored to practice the tenets of romanticism as expressed by the great writer in his *Preface to Cromwell*. His utterances as editor of *Rappel*, an anti-Imperial journal, were several times made the subject of court proceedings. Beginning with poetry, *L'Enfer de l'esprit* and *Les demi-teintes* (1845), Vacquerie later wrote the following plays: *Tragaldabas* (1848), a failure; *Drames de la grève* (1855); *Les funérailles de l'honneur* (1861), a seven-act Romantic drama; *Jean Baudry* (1863); *Les fils* (1866). His *Théâtre complet* appeared in 1879. Vacquerie's work is vividly imaginative.

VACUUM, vâk'û-üm. See AIR PUMP.

VACUUM CLEANER. A mechanical device for removing, by means of air suction, dirt, dust, and other fine matter from carpets, upholstery, walls, and other surfaces. The device consists essentially of a nozzle to be passed over the material to be cleaned, a pipe connecting the nozzle with a separator where the dust and dirt are removed from the air, and an apparatus for producing a vacuum. The nozzles are of various sizes and forms, according to the use for which they are intended, such as cleaning carpets on the floor, or removing the dust from books on a shelf. The exhausters that produce the vacuum are of various types. There are three kinds of plants in general use: One small, portable, and compact, electrically driven by being connected to a lamp socket. Another, permanently mounted on a vehicle and driven by an internal-combustion engine, is drawn up at the curb and a hose led into the building to be cleaned. The third is a permanent installation, usually located in the basement of a building and connected by built-in pipes with outlets where a hose and nozzle may be attached in the various rooms and halls.

David T. Kenney of New York is credited with installing the first pure vacuum system in 1902, and about 1905 Dr. William Noe of San Francisco constructed the first portable vacuum cleaner. Consult M. S. Cooley, *Vacuum Cleaning Systems* (New York, 1913); N. S. Thompson, *Mechanical Equipment of Federal Buildings* (New York, 1915).

VACUUM PROCESS. See REFRIGERATION.

VADIANUS, JOACHIM (1484-1551). A Swiss reformer and humanist, whose real name was Von Watt. He was born in Saint-Gall, was educated there and in Vienna, and became instructor in classics at the University of Vienna in 1514. He returned to Saint-Gall in 1518 to practice medicine. But his great work there was as a reformer and a friend of Zwingli, and it was largely due to his influence that Saint-Gall in 1525-27 went over entirely to the Protestant church. He took a prominent part in the religious colloquies of Zurich (1523), and of Bern (1528), and corresponded with Luther and Erasmus. He wrote a *Chronicle* of the abbey of Saint-Gall, edited by Güttinger with Vadianus' other German works (1875-77), and a *Commentarius in Pomponium Melan* (1518). Consult: Geilsius, *J. v. Watt als geographischer Schriftsteller* (Winterthur, 1865); Preffel, *J. Vadian* (Elberfeld, 1861); and Güttinger, *J. v. Watt* (Halle, 1895).

VADIMONIAN LAKE (Lat. *Vadimonius Lacus*). A small circular lake in Etruria, now Lago di Bassano. It is famed as the scene of

two Roman victories over the Etruscans: the first in 309 B.C. under the dictator Papirius Cursor, the second in 283 B.C. under the consul Dolabella.

VADSÖ, vads'ē. A town on the northeast coast of Norway (lat. 70° 4' N., long. 19° E.). Located on the shores of Varanger Fiord and on Vandö Island, it is attractive considering its high latitude, with a mean yearly temperature of 33° F. It has a town hall, schools, residences for civil and military officials, and five fish-oil refineries. It engages in extensive fisheries in the Atlantic and in the Arctic, in coastwise shipping, and in summer in shipping to Russia. It exports fish and fish products, guano, skins, game, and reindeer meat. Vadsö dates from 1567. Pop., 1910, 3322.

VADUZ, vi'duts. The capital of the Principality of Liechtenstein. It is charmingly situated near the right bank of the Rhine, at an elevation of 1525 feet, and is on the Feldkirch-Buchs branch of the Austrian State Railway. It is near the Three Sisters (6880 feet). The town has a Gothic parish church and a castle, which, destroyed by the Swiss in 1499, was rebuilt in 1523-26. The tower of the castle dates from the ninth century. Pop., 1912, 1376.

VAGA, vä'gä, PERINO DEL (1500-47). An Italian decorative painter. He was born in Florence, was perhaps a pupil of Ghirlandaio or Fra Bartolommeo, and certainly of Raphael, whom he assisted in Rome in the stucco and arabesque decorations of the Loggia of the Vatican. He also executed some of the scriptural subjects there, and the figures of the planets in the great hall of the Appartamento Borgia. After the sack of Rome in 1527 he went to Genoa, where he decorated the Doria Palace with stuccoes and frescoes in a style similar to that adopted by Giulio Romano at Mantua, with subjects from classical fables. Later he returned to Rome, where he designed a number of façades, hall and church frescoes, and with Daniele da Volterra decorated the Sala Reggia in the Vatican.

VAGANTES, vä-gän'tez (Lat., wanderers). The name given to the itinerant students and clerics of the twelfth and thirteenth centuries, indistinguishable often from the wandering minstrels and clowns who form so picturesque a feature of mediæval life. They are known for the body of satirical literature in Latin which they created, commonly designated as Goliardic literature (q.v.).

VAGARSHAPAT, vä-gär'shā-pāt. A village of Russia. See under ETCHMIADZIN.

VAGINA (Lat., sheath). One of the sexual organs in the female. It is a sheath from 4 to 7 inches long, into which open the uterus and the urethra. It lies behind the bladder and in front of the rectum, and it is lined with mucous membrane. Its external opening is called the vulva, which is formed by the apposition of the two *labia majora*.

VAGLIERI, väly-ä'rē, DANTE (1865-1914). An Italian classical scholar, born at Triest. He studied at Triest and at the University of Vienna. From 1893 to his death he was connected, in various capacities, with the University of Rome. He had charge also for some years of the important excavations at Ostia (q.v.), which he prosecuted with such energy and skill that Ostia now rivals Pompeii as a source of information concerning ancient Roman life.

VAGRANT. In law, a term of broad appli-

cation including, in general, all idle and disorderly persons who may become a menace to the public peace or a public burden. The statutes in Great Britain and the United States differ in details, but are elastic enough to cover such diverse classes as unlicensed peddlers, beggars, drunkards, fortune tellers, prostitutes, notorious criminals, etc., as well as the specific tramp (q.v.).

VAGUS NERVE. See PNEUMOGASTRIC NERVE.

VAHLEN, vä'len, JOHANNES (1830-1911). A German philologist, born in Bonn, where he studied at the university, and became privat-docent in 1854. In 1856 he was made professor in Breslau, in 1858 at Vienna, and in 1874 in Berlin. Among his writings are to be noted especially: *Ennianæ Poesis Reliquiæ* (1854; 2d ed., 1903); *Nævii de Bello Punico Reliquiæ* (1854); *Ueber die Annalen des Ennius* (1886); *Ulpiani Liber Regularum* (1856); *Cicero de Legibus* (2d ed., 1883); a critical edition of Aristotle's *Poetics* (3d ed., 1885); *Lorenzo Valla* (2d ed., 1870); *Laurentii Vallæ Opuscula* (1869); and many articles in periodicals. For several years he was coeditor of the periodical *Hermes*, and also of the *Zeitschrift für österreichische Gymnasien*. Since his death his miscellaneous papers have been published in *Opuscula Academica* (2 vols., Leipzig, 1907). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

VAI. See VER.

VAIGATCH, vi-gäch' (WAIGATZ). An island in the Arctic Ocean belonging to the Russian Government of Archangel, between the mainland and Nova Zembla (Map: Russia, J 1). It is separated from the latter by the Kara Strait, and from the mainland by the Yugor (Waigatz) Strait, while its east coast is washed by the Kara Sea. It is about 70 miles long and 25 miles wide, with an area of 1400 square miles, and is traversed lengthwise by a range of mountains, an extension of the Ural system. The climate is cold and the vegetation very scanty. The island is permanently inhabited by a few Samoyeds, but in summer it is visited by a number of Russians for its fisheries and the fur-bearing animals.

VAIHINGER, vi'hing-ēr, HANS (1852-). A German philosophical critic, born at Nehren, and educated at Tübingen, Leipzig, and Berlin. He became docent at Strassburg in 1877, and professor in 1883, and in 1884 went to Halle as professor of philosophy and pedagogy. He is known chiefly as a critic of Kant. He edited *Kantstudien* after 1896, and wrote a *Kommentar zu Kants Kritik der reinen Vernunft* (2 vols., 1881-92); *Kant—ein Metaphysiker?* (1889); *Die transcendente Deduktion der Kategorien* (1902). His other works include: *Goethe als Ideal universeller Bildung* (1875); *Hartmann, Dühring und Lange* (1876); *Nietzsche als Philosoph* (2d ed., 1902); *Die Philosophie in der Staatsprüfung* (1906); *Die Philosophie des Als Ob—System der theoretischen, praktischen, und religiösen Fiktionen der Menschheit* (1911; 2d ed., 1913).

VAIL. See DRINKING USAGES.

VAIL, väil, ALFRED (1807-59). An American inventor, born at Morristown, N. J. He graduated at the University of the City of New York in 1836. In September, 1837, he entered into partnership with Prof. S. F. B. Morse (q.v.), agreeing to supply the funds necessary to bring

Morse's newly invented telegraph before the public, and to construct a practicable model at his father's ironworks at Speedwell, near Morristown, N. J. In January, 1838, the model was completed, and on the twenty-third was first publicly exhibited at the University of New York. When in 1843 work was begun on an experimental line between Washington and Baltimore, Vail became assistant superintendent. He suggested so many improvements to Morse's original apparatus, as did also Joseph Henry (q.v.), that the modern telegraph is considered by some to be the product of Vail and Henry rather than of its original inventor. Vail published *The American Electro-Magnetic Telegraph* (1845). Consult Pope, "The American Inventors of the Telegraph," in the *Century Magazine*, vol. xxxv (New York, 1888).

VAIL, CHARLES HENRY (1866–). An American Universalist clergyman and writer on Socialism, born at Tully, N. Y. He graduated from the theological school of St. Lawrence University in 1893 and was pastor at Jersey City, and in New York State at Albany, Richfield Springs, and Albion (from 1906). Becoming deeply interested in the study of Socialism, he indorsed its principles and wrote: *Modern Socialism* (1897), *National Ownership of Railways* (1897), *Scientific Socialism* (1899), *The Industrial Evolution* (1899), *Mission of the Working Class* (1900), *The Socialist Movement* (1901), *The Trust Question* (1901), *Socialism and the Negro Problem* (1903), *Ancient Mysteries and Modern Masonry* (1909), *The World's Saviors* (1913), *Militant and Triumphant Socialism* (1913).

VAIL, STEPHEN MONTFORT (1818–80). An American Methodist Episcopal clergyman, born at Union Vale, Dutchess Co., N. Y. He graduated from Bowdoin College in 1838 and Union Theological Seminary in 1842, and was then a pastor in New York. For two years he served as president of Pennington Seminary (N. J.), and from 1849 to 1868 as professor of Hebrew in the General Biblical Institute at Concord, N. H. From 1869 to 1874 he was United States Consul to Bavaria. He strongly advocated the abolition of slavery and was an early champion of training for the ministry, writing effectively on both these subjects; also *Outline Lessons in Hebrew*.

VAIL, THEODORE NEWTON (1845–1920). An American capitalist, born in Carroll Co., Ohio. He was educated at Morristown (N. J.) Academy, and then studied medicine for two years. He was early connected with the United States railway mail service, of which he was general superintendent in 1875–78. In 1878 he became interested in the telephone business, and after 1896 was identified with electric enterprises in the Argentine, introducing the American electric system of street railways in Buenos Aires, and installing telephone systems in the principal Argentine cities. Vail became president of the American Telephone and Telegraph Company and of the Western Union Telegraph Company. In 1913 the former corporation, which, because of its close relations with the Western Union and subsidiary companies, had become known as the "telephone trust," complied with the government's request for reorganization. Vail then resigned from his office in the Western Union. With other New Haven directors in 1916 he was acquitted of a charge of conspiracy to monopolize interstate commerce. In 1915 he received the

honorary degree of LL.D. from both Princeton and Harvard.

VAILIMA (vi-lě'mà) **LETTERS**. A series of letters written from Samoa by Robert Louis Stevenson between November, 1890, and October, 1894. They are addressed to Sidney Colvin and contain a varied record of his Samoan exile. The title is derived from the name given by Stevenson to his island home.

VAILLANT, vā'yān' (MARIE) EDOUARD (1840–1915). A French socialist, born at Vierzion (Cher), and educated in Paris, where he studied engineering and then medicine, and in Heidelberg, Tübingen, and Vienna. After his return to Paris in 1870 he took a prominent part in the government of the Commune and served for a time as Minister of Education. He escaped to London on the downfall of the Commune, became a member of the general committee of the Internationale, took part in The Hague conference in 1872, and in the same year was sentenced to death in *contumaciam* by the Conseil de Guerre. After the amnesty of 1880 he returned to Paris, and in 1884 was elected to the municipal council, where he advocated the suppression of standing armies, national control of public services, and various socialistic measures. He opposed Boulangism very strongly, at the same time attacking the opportunism of the radical Republicans. He was elected several times to the Chamber of Deputies, where he sat as a Socialist.

VAIR. One of the tinctures in heraldry (q.v.).

VAISESHIKA, vi-sā'shē-kā. The name of one of the two great divisions of the *Nyāya* (q.v.) school of Hindu philosophy, and probably a later development of the *Nyāya*, properly so called. It agrees with the latter in its analytical method of treating the subjects of human research, but differs from it in the arrangement of topics and especially in its doctrine of atomic individualities or *viśeṣas*—whence its name.

The topics or categories (*padārthas*) under which Kanāda (q.v.), the founder of this system, arranges his subject matter, are the following six; (1) substance, (2) quality, (3) action, (4) generality, (5) atomic individuality, and (6) coinherence; and later writers of his school add to these a seventh category, nonexistence. These may be explained more precisely. 1. Substance is the intimate cause of an aggregate effect; it is that in which qualities abide, and in which action takes place. It is ninefold—earth, water, light, air, ether, time, space, soul, and *manas*, or the organ of affection. 2. Quality is united with substance; it comprises, according to the commentator, the following 24 elements: color, savor, odor, feeling, number, dimension, individuality, conjunction, disjunction, priority, posteriority, gravity, fluidity, viscosity, sound, understanding, pleasure, pain, desire, aversion, volition or effort, merit, demerit, and self-restitution. Seven of these are later additions to Kanāda's list. That qualities belong to the soul is maintained by the Vaiseshikas in opposition to the Vedantists and Sankhyas. 3. Action consists in motion, and abides in substance alone. 4. Generality abides in substance, quality, and action. It is of two kinds, higher and lower, or genus and species. 5. Atomic individuality resides in eternal substances, by which are meant *manas*, soul, time, space, ether, earth, water, light, and air; it is the *viśeṣa* or ultimate difference; such differences are end-

less; and two atoms of the same substance, though homogeneous with each other, differ merely in so far as they exclude each other. 6. Coinherence, or perpetual intimate connection, resides in things which cannot exist independently from one another, such as the parts and the whole, action and agent, species and individual, atomic individuality and eternal substance. 7. Nonexistence, the last category, is defined by the modern Vaiseshikas as being either nonexistence without beginning, but with an end; or nonexistence, with a beginning, but no end; or absolute nonexistence, which has neither beginning nor end; or mutual nonexistence, which is the reciprocal negation of identity. The nature of each of these substances, qualities, and actions, is then the subject of special investigation. It is worthy of note that, according to the Vaiseshika system, understanding (*buddhi*) is the quality of soul, and the instruments of right notion are treated under this head. Kanāda admits of only two such instruments, or *pramāṇas*, perception and inference. Comparison, revelation, and the other instruments of right notion, mentioned in other systems, according to the commentators are included in these two. Fallacies and other modes of inconclusive reasoning are further dealt with in connection with inference, though with less detail than in the Nyaya, where these are favorite topics for discussion.

In point of time the Vaiseshika system antedates that of the Vedānta (q.v.) and possibly originated not long before the Christian era. The work of its reputed founder, Kanāda, has been commented upon by a triple set of commentaries, and popularized in several elementary treatises. J. T. Panchanana edited the text with the commentary of *Saṅkara Miśra* (Calcutta, 1861), while Ballantyne translated some of the sutras (Mirzapore, 1851).

VAISHNAVA, *viśṇu-nā-vā* (Skt. *vaiṣṇava*, adherent of Vishnu). The general name of a worshiper of Vishnu (q.v.), but applied particularly to one who worships him in his incarnate form, either as Krishna or as Rāma. Even those who worship Vishnu under other forms, or avatars (see AVATAR), are adherents at the same time of one of these two sects. Of the two, the older division comprises the Krishnaites who were known in the earliest sectarian period (c.200 B.C.) as *Pāñcarātras* and *Bhāgavatas*. Whether these names were at first applied to the same sectaries or to two divisions of Krishnaites is not known; but in the seventh century A.D. they appear to be two distinct bodies. The essential tenet of these sects is that which is maintained by all Vaishnavas, viz., that, besides the identity of Krishna with Vishnu, the human soul is a distinct entity, while incorporate in an earthly body, and after the death of the body it becomes one with Vishnu. This qualified idealism distinguished the Vaishnavas philosophically from the Saivas (q.v.) on the one hand, and from the Vedantists (see VEDĀNTA) on the other. Another tenet held by all Vaishnavas, though not exclusively by them, is the doctrine of *bhakti* or saving faith, and this may be said to be the great popular support of these sects. It appears first in the *Bhagavadgītā* (q.v.), the oldest scripture of the Vaishnavas. According to this doctrine, all works and other beliefs are without essential value, though good works and right knowledge are useful. The one essential, however, is faith

in Krishna (or Rāma) as Vishnu, i.e., as supreme deity. Salvation, further, consists in being received back into God's essence. The corresponding activity on the part of the divinity is grace or favor extended to such as have faith. In the grosser conception of Vishnu as a god occupying a heaven of his own, the soul, instead of being reabsorbed, simply shares the joy of this heaven.

At the present time the Krishnaites are largely in the majority in northern India, while the Ramaites are strongest in the southeast, the southwest being the home of one of the strong Krishnaitic sects, which arose in the twelfth century. At this period, in fact, sprang up the chief sects of both parties, and from this time onward the antagonism between the sects and subsects of each separate division became powerful.

Before these popular schools or sects arose, a special division of Krishnaitic Vaishnavas was formed (c.1200 A.D.) on the Malabar coast under the influence of Anandatīrtha, the founder of a school known as Madhvas. He taught not only the separate existence of human souls, but the separate existence of matter as an eternal essence. This school remains a restricted southern growth, but the duality doctrine, as it is called, has been accepted by the masses over a wide area. Both the next great Krishnaitic sects emphasize an entirely new practice, on which they lay more weight than they do on theology or metaphysics. This is the practice of revering the Child Krishna. No trace of this cult, with its accompaniment of madonna worship, is to be found in the records of the older sects, and it is possible that the practice was an imitation of Christian usage. Unfortunately, with the introduction of this child worship was still retained the antique conception of Krishna as an amorous shepherd, and under the influence of these two images, together with the continual emphasis upon *bhakti*, the worship of Krishna-Vishnu rapidly deteriorated. This element became supreme in the later development of the Krishnaitic sects of the north, where among the lower classes it has superseded all other religious notions and has deeply affected even the cultivated classes.

The first of these sects is that of Caitanya, who was born in Bengal in 1485. His special religious tenet was love for Krishna. This was expressed by songs and dances of a licentious character. Caitanya himself, like most of the late Vaishnava teachers, was regarded as also divine and as a reincarnation of Krishna himself. The second great sect of Krishnaites arose in the northwest and was founded by Vallabha, called also Vallabhacarya. His sect was no less self-indulgent. The worship of the Child Krishna was particularly affected by the Vallabhas with all its excesses. But the sect is saved from the uniform low level of the Caitanyas through the fact that it is not without sectarian literature. The founder reverted to the nondualistic doctrine of the Vedānta, and the philosophy of his school is thus distinguished from that of Caitanya, who taught that each believer was to exist as a separate spirit in a heaven filled with sensual pleasures. Both these sects elevate Radha, the mistress of Krishna, to a divine position. A reform of both these religious bodies took place in the eighteenth century. The Caran Dasīs were protestants against the excesses of the Vallabha sect and they instituted a moral reform based on the purer belief and practice of the

southern Madhva Krishnaites. A similar protest against the Vallabha sect resulted in the formation of a new division under the leadership of Narayana, who was worshiped as a god by his adherents. Other reforming sects of this sort scarcely deserve to be called Vaishnavas, as they are eclectic deists.

At the same time that Madhva was founding his Krishnaitic sect in southwestern India, Ramanuja in the southeast (about Madras) was founding the first distinctively Ramaite Vaishnava sect. The Ramanuja sect remained in the south, but the sect founded by Ramanuja's follower, Ramanand, was operative in the north in the fourteenth century, and to this sect are due in succession some of the reform movements of more recent times. The Northern School (Vadagalis) hold to the monkey doctrine, while the Southern School (Tengalais) affect the cat doctrine. The former doctrine holds that God saves the sinner as a monkey does its young, by allowing the young to embrace it and be carried to safety. The cat doctrine is Calvinistic, affirming that God saves as does a cat, by picking up the kitten without concurrence or effort on the kitten's part. The Tengalais are the more numerous and have a theological literature written in Tamil (see TAMILS).

But the great difference between Krishnaites and Ramaites is moral and intellectual. The Krishnaitic Vaishnavas, with few exceptions, such as that of the high-caste Madhva sect, are as epicurean and licentious in practice as they are unphilosophical in intellect. What literature they possess is small, apart from erotic poetry. On the other hand, the Rama schools have elaborated complete theological systems, and, generally speaking, they are morally above reproach. Most Ramaites hold that the deity is not without qualities, and in logical conclusion they maintain that Rama as Vishnu has a heaven of pure delight in which the believer will lead a pure but joyful existence, not being absorbed into the divine essence. In consequence of the moral tone of the Rama Vaishnavas, it is from them rather than from the Krishnaites that the later reformers draw their inspiration. Kabir, one of the disciples of Ramanand, founded the sect of the Kabir Panthis, which still has a large following in northern India, but unites Rama and the divine monkey, Hanuman (q.v.), in one common worship. A purely deistic sect also claiming Ramanand as the teacher of their founder is that of the Dadu Panthis. The literature of the modern Vaishnava sects is best represented by the *Ramcaritmanas* of Tulasidasa, the greatest of modern Hindu poets, and by the *Premasāgar* or ocean of love, an erotic-religious poem of the Vallabha sect. For the older literature, see the article VISHNU.

It remains only to be said of the Vaishnavas that some of the subsects worship almost exclusively the female side of Vishnu, in the form of his wife, Lakshmi (q.v.), or in that of Sita, the wife of Rama. The Vaishnavas have several famous festivals, the chief being that of the *Rāth Yāha* in Bengal, in which an image of the god is carried in a procession, the *Jannamāṣṭami* or birthday festival of the Child Krishna at Benares, and the *Rās Yāha* or dance festival, commemorating the dancing of Krishna with the Gopis, his mistresses. The general sign of all Vaishnavas consists of two perpendicular marks on the forehead. They revere as symbols the Tulasi plant and the salagrama stone, a

white pebble; the veneration for this latter as a symbol, however, is of recent origin. See HINDUISM.

VAL, FRANÇOIS DU. See FONTENAY-MAREUIL.

VALAAM, vā'liim' (Finnish *Valamo*). A small, wooded island (12 square miles in area) in the northern part of Lake Ladoga (q.v.) in Finland, Russia (Map: Russia, D 2). It is very picturesque and surrounded by 40 smaller islands. On its south end is the famous Valaam Monastery of the Transfiguration which attracts numerous pilgrims.

VALAIS, vā'lā' (Ger. *Wallis*). A canton of south Switzerland (Map: Switzerland, B 2). Area, 2027 square miles. It consists of the valley of the Rhone and a number of lateral valleys along its tributaries, inclosed by the Bernese Alps on the north and the Valais Alps on the south. Valais abounds in glaciers which occupy about one-fifth of its area. The highest point is the Dufour Peak on Monte Rosa, 15,217 feet. Valais contains many kinds of minerals, principally lead, gold, iron, anthracite, marble, and limestone. Most of these minerals are worked. The canton is chiefly pastoral, vineyards and orchards being found only in the deep valleys. The wines of Valais are well known. The chief manufactures of the canton are soap, glass, sugar, and dynamite. The constitution of Valais provides for a legislative assembly (*Grand Conseil*) elected directly at the rate of one member for every 1000 inhabitants. The capital is Sion (q.v.). Pop., 1910, 129,570; almost entirely Roman Catholic. The French-speaking inhabitants, who form about two-thirds of the population, inhabit the western part of the canton and the German-speaking the eastern.

The valley of the upper Rhone, the *Vallis Pœnina* of the Romans, was conquered by the Romans in 57 B.C., and later incorporated with Rætia. On the dissolution of the Roman Empire the region was occupied by the Burgundians, whose rule was supplanted by that of the Franks. After the disruption of the Frankish realm, at the close of the ninth century, it formed part of the Kingdom of Transjurane Burgundy and then of the Kingdom of Arles. Later the bishops of Sion and the counts of Savoy held sway in western or Lower Valais, contending

with each other for dominion, while Upper Valais was colonized by Germans, who founded a number of independent communities or tithings. Finally, in the fifteenth century, Upper Valais, after joining the Swiss Confederation, secured control of Lower Valais, which was ruled as a subject territory. In 1798 the whole region became part of the Helvetic Republic. In 1802 Valais was made an independent republic by Napoleon, who annexed it in 1810 to France as the Department of Simplon. It was freed in 1814, and in 1815 was constituted a canton of the Swiss Confederation. It took part in the League of Sarnen as well as in the Sonderbund.

VALCKENAER, vāl'ke-nār, LODEWIJK KASPAR (1715-85). An eminent Dutch classical scholar, born at Leeuwarden, and educated at Franeker and Leyden. In 1741 he became professor of Greek at Francker, and 25 years later was called to Leyden. He is known for his editions of Euripides' *Phanissæ* (4th ed., 2 vols., 1824) and the *Hippolytus* of Euripides, which contained the famous *Diatribē in Euripidis Perditarum Fabularum Fragmenta* (1768). He also edited Homer's *Iliad* with Scholia (1747), Theocritus, Bion, and Moschus (1781). His greatest work, however, was his *Diatribē de Aristobulo*, first published posthumously by Luzac (1806), in which he exposed the literary forgeries of the Alexandrians. His *Opuscula Critica*, etc., were published in 2 vols. (1801). Consult: L. Müller, *Geschichte der klassischen Philologie in den Niederlanden* (Leipzig, 1869); Bergmann, *Memoria Valckenarii* (Utrecht, 1874); J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

VALDAI (vāl-dī') **HILLS**. A low plateau or group of hills in west central Russia, occupying the southwestern parts of the governments of Novgorod and Tver, midway between St. Petersburg and Moscow (Map: Russia, D 3). They form the culminating portion of the broad elevation running through central Russia, and rise very gradually from the surrounding plain. They are dissected by numerous narrow valleys containing a number of lakes. The hills rise to the maximum height of 1150 feet above the sea. They were formerly forested, but are now mostly cleared and cultivated. In the plateau rise the Volga and its branches which flow east and south to the Caspian, the Dnieper and the Don to the Black Sea, and others northwest to the Baltic.

VALDEGAMAS, vāl'dā-gā'mās, MARQUÉS DE. See DONOSO-CORTÉS.

VAL-DE-GRÂCE, vāl'-de-grās'. A former Benedictine nunnery in Paris, founded by Anne of Austria, and changed into a military prison in 1790. The dome of the church, dating from 1645, is modeled on that of St. Peter's at Rome. The church was the place of burial of the French royal family and the Orleans princes, and contains the tomb of Henrietta, wife of Charles I of England.

VAL-DE-GRAVE, JEAN BAPTISTE DU. See CLOOTS, BARON.

VAL DEL BOVE, vāl děl bō'vā. A crater of the volcano of Etna (q.v.).

VALDEPEÑAS, vāl'dā-pān'yās. A town of the Province of Ciudad Real, Spain, 115 miles south of Madrid, on the right bank of the Jabalón River (Map: Spain, D 3). It is on the highway to Andalucía. It has manufactures of spirits, flour, and cooperage ware; but its reputation rests mainly upon its celebrated red

wine. There are chalybeate springs in the vicinity. Municipal pop., 1900, 20,688; 1910, 23,580. The town made an heroic defense against the French in 1808.

VALDER, JOSÉ LUCIO. See BOMFIM, COUNT.

VALDÉS, vāl-dās', ARMANDO PALACIO. See PALACIO VALDÉS.

VALDÉS, JUAN DE (c.1500-41). A Spanish-Italian theologian and reformer. He was born at Cuenca, in Castile, imbibed some of the ideas of the Reformation in Germany, and in 1528 wrote a treatise, *Diálogo de Mercurio y Carón*, criticizing the Church in such manner that the Inquisition made Spain uncomfortable for him. He went to Naples in 1530, spent some time in Rome and Bologna, and in 1533 returned to Naples, where he resided until his death. He devoted himself to study and literature and gathered round him a choice circle, including Peter Martyr and Vittoria Colonna. He was an advocate of the Lutheran doctrine of justification by faith, but remained a Catholic. His *Diálogo de la lengua* (Naples, 1533) is the earliest philological treatise we have in Spain. His works earn him high rank among Spanish writers.

Consult: B. B. Wiffen, *Life and Writings of Juan de Valdés*, with a translation from the Italian of his Hundred and Ten Considerations, by John T. Betts (London, 1865); Edward Boehmer, *Spanish Reformers of Two Centuries* (1874); id., *Lives of Juan and Alphonso de Valdés* (1882); Marcelino Menéndez y Pelayo, *Los heterodoxos Españoles* (Madrid, 1880) and in his *Obras completas*, vol. i ss. (Madrid, 1911, etc.).

VALDÉS, JUAN MELÉNDEZ. See MELÉNDEZ VALDÉS, JUAN.

VAL'DEZ. An incorporated city on a northern arm of Prince William Sound, Alaska, the most northerly port that is open throughout the winter (Map: Alaska, K 5). The great interior Alaskan mail route lies over the wagon road from Valdez to Fairbanks, where passengers and mail are carried by stage in summer and on sleds in winter. The junction of the cables and land lines is made at Valdez, of the United States Signal Corps telegraph system of over 4000 miles. The city has churches, schools, and a telephone system. Pop. (1915), about 1200.

VALDEZ, PIERRE. See WALDENSES.

VAL D' ISPICA. See ISPICA, VAL D'.

VALDIVIA, vāl-dē'vā. A province of South Chile, bounded by Llanquihue on the south, Cautín on the north, Argentina on the east, and the Pacific on the west (Map: Chile, E 5). Area, 8352 square miles. The larger part of the surface is level and only the portion adjoining the Andes and the coast land are mountainous. The climate is moist and healthful and the soil is fertile. Forests are abundant in the mountainous regions, and timber is one of the most important products of the province. The chief occupations are lumbering, agriculture, and grazing. Pop., 1903, 78,073; 1912, 141,298, including a large German element. Capital, Valdivia.

VALDIVIA, PEDRO DE (c.1497-1554). The Spanish conqueror of Chile. He was born at Serena, in Estremadura, and served in the Spanish armies in the Italian wars, being present at the capture of Milan and the battle of Pavia (1525). He went to the New World and in Mexico joined Cortés, by whom he was sent to

Peru when Pizarro asked for help against the Inca insurrection in 1535. His brilliant conduct in the battle of Salinas led to his selection to prosecute the conquest of Chile. In March, 1540, he started south with 150 men. Early in 1541 he laid the foundations of the city of Santiago, and for six years he successfully combined the establishment of settlements in the country with the operations against the Indian armies. In December, 1547, he returned to Peru, where he rendered important service on the royal side in the contest with Gonzalo Pizarro. As soon as this rebellion was ended on the plain of Sacsahuana, Valdivia hastened back to Chile, in January, 1549, to renew the war against the Araucanian Indians. He met with repeated successes, but was unable to stamp out the guerrilla bands, which united in a fierce attack on the Spanish fort at Tucapel in December, 1553. Valdivia hastened to its relief, and had all but dispersed the Araucanians, when the latter were suddenly rallied by a young native page of Valdivia, named Lautaro, who deserted his master at the critical moment, called upon his countrymen to renew their attack, and annihilated the Spaniards (Jan. 1, 1554). Valdivia was captured and killed, despite the efforts of Lautaro to save his life. Consult *Colección de documentos inéditos para la historia de Chile . . . publicados por J. T. Medina: Valdivia y sus compañeros* (6 vols., Santiago de Chile, 1896-97).

VALDOS'TA. A city and the county seat of Lowndes Co., Ga., 156 miles southwest of Savannah, on the Atlantic Coast Line, the Georgia and Florida, the Valdosta, Moultrie, and Western, and the Georgia Southern and Florida railroads (Map: Georgia, C 5). It is the shipping centre of a region engaged in cotton and fruit growing and farming, and manufactures cloth, lumber products, fertilizers, buggies, cottonseed oil, foundry and machine-shop products, and naval stores. Noteworthy features are the South Georgia Normal College, the high schools, the Federal building, and the Carnegie library. Valdosta was settled in 1850, and was incorporated in 1860. Pop., 1900, 5613; 1910, 7656; 1920, 10,783.

VALENCE. See VALENCY.

VALENCE, vá'láns'. The capital of the Department of Drôme, France, 66 miles by rail south of Lyons, crowning a hill on the left bank of the Rhone, below the confluence of the Isère (Map: France, S., K 4). The cathedral of St. Appolinaire, in the odd Auvergnat-Romanesque style, consecrated in 1095, contains an apse with colonnade. The Maison des Têtes (sixteenth century), with its beautifully decorated windows and its front sculptured with heads of Homer, Aristotle, Pythagoras, and Hippocrates, and the fine paintings of the church of St. Jean Baptiste are worthy of mention. There is a fine suspension bridge over the Rhone. Across the river lie the interesting ruins of the Crussol, a twelfth-century castle. The printing of linen and cotton fabrics, the manufacture of flour and tinned foods, and agriculture are important industries. The vineyards are of great extent. Pop., 1901, 26,946; 1911, 28,706. Valence is the Valencia of the Romans.

VALEN'CIA, *Span. pron. vá-lán'thé-á.* The name of a former kingdom of Spain, comprising the present provinces of Valencia, Alicante, and Castellón de la Plana. The region is bounded on the north by Aragon and Cataluña, on the east by the Mediterranean, on the south by Murcia,

and on the west by Murcia, New Castile, and Aragon. Area, 8830 square miles. The surface is of a broken mountainous character, with some small plains scattered along the coast and in the uplands of the southwest. The plains bordering the Mediterranean abound in lagoons, from many of which salt is derived in large quantities. There are few good harbors. The most important rivers are the Segura, Guadalaviar (or Turia), Júcar, and Mijares. The rainfall varies greatly, and the cold north winds and the hot southwest winds are very dry. The temperature varies from the extreme summer heat of the lower coast plains and valleys to the extreme winter cold of the inland mountain regions. With this variation in temperature and rainfall there is a wide variety of agricultural products. Wheat and other cereals are grown in fairly large quantities, but their yield is surpassed by that of the vine, rice, sugar, and fruits, among which the exports of oranges and figs have the lead. The stock-raising interests of the section, chiefly sheep and goats, are important. The mining industry is not very large, lignite, iron, lead, and zinc being produced in small quantities. In manufactures Valencia ranks next to Cataluña and has extensive textile establishments, iron and copper foundries, distilleries, sugar mills, and potteries. The fisheries and the curing of salt fish also employ a considerable portion of the population. The inhabitants, who preserve many traits of the Moorish admixture, in 1900 numbered 1,587,533, and in 1913, 1,727,759. Upon the dissolution of the Caliphate of Córdoba in the early part of the eleventh century, Valencia became an independent kingdom. Towards the close of the century it passed under the rule of the Almoraides, who were supplanted three years later (1095) by the Cid, whose death (1099) soon forced his widow again to give way to the Moors. In 1238 the city of Valencia was taken by James I of Aragon, who soon became master of the region.

VALENCIA. A Mediterranean seaport of Spain, capital of the Province of Valencia, 185 miles east-southeast of Madrid, on the right bank of the Guadalaviar, 2½ miles from its mouth (Map: Spain, E 3). As the capital of the former Kingdom of Valencia it retains many traces of Moorish occupancy. The surrounding huerta resembles a vast shady orchard and bears magnificent groves of citron, orange, and mulberry. The city itself is picturesque in the crowded, narrow, and winding streets of the older portion and charming in the broader streets and luxurious plazas and paseos of the newer part. Its climate is mild and very dry. The public buildings are numerous and interesting architecturally and because of their historical significance. Among the important churches the Cathedral La Seo, with its splendid octagonal tower El Miguelete, occupies first place. This structure was begun in 1262 and completed in 1482. Before the Puerta de los Apóstoles of the cathedral there meets every Thursday the Tribunal de las Aguas, which is the oldest tribunal in Spain and controls the distribution of the irrigation water. The church of San Andrés contains some beautiful frescoes and paintings of Juanes, Ribalta, and Vergara. The former Convento del Carmen is now utilized for the Provincial Museum of Paintings, with a very complete collection representing the Valencian school and some notable foreign works. La

Lonja (the silk exchange), the centre of the commercial life of the city, is a beautiful Gothic structure, built on the site of the Moorish Alcázar. The Aduana, a superb structure erected for a customhouse by Charles IV, is now occupied as a tobacco factory, employing 4000 operatives. The provincial hospital, housed in a fifteenth-century structure, accommodates 6000 patients annually. The ornamental Plaza de Toros, or bull ring, reputed the best in Spain, seats 17,000 spectators. The Plaza del Mercado is the largest of the public squares of the city; others of note are the Plaza del Príncipe Alfonso, the Plaza de Tetuán, the site of the old citadel, and the Plaza de la Reina, a busy shopping and café centre. The harbor of Valencia (El Grao) is one of the most secure on the Mediterranean coast. The chief exports are rice, melons, oranges, and other fruits, green and dried, wines, silks, raw and spun, and an excellent quality of olive oil. The industries of the city include tobacco manufacturing, silk spinning, and hemp and linen weaving. There are also manufactures of velvet, hat plush, felt, gloves, fans (a special product), iron and bronze ware, leather goods, and especially the glazed pottery ware and the glazed bricks known as azulejos, for which there are more than 20 establishments in the environs of the city. The agricultural industries of the vicinity are also important. Valencia is the seat of one of the foremost universities of Spain. (See VALENCIA, UNIVERSITY OF.) The population, illustrating in character and physical traits the early Moorish admixture, numbered, in 1900, 213,550; in 1910, 233,348. Valencia first appears in history in 138 B.C., when it was given the *Jus Latinum*. It was destroyed by Pompey, captured by the Visigoths in 413, and by the Moors in 714. In 1021 it became the capital of an independent Moorish kingdom. In 1095 it was captured by the Cid, but the Moors subsequently assumed control, until its final capture by James I of Aragon in 1238. The expulsion of the Moriscos at the beginning of the seventeenth century greatly crippled its prosperity, and by espousing the Austrian side during the War of Spanish Succession it lost many of its ancient privileges. In 1812 it was captured by Suchet and remained in the possession of the French until the following year.

VALENCIA. See VALENTIA.

VALENCIA. The capital of the State of Carabobo, Venezuela, situated 24 miles south of Puerto Cabello, with which it has railway connection, near the western end of Lake Valencia or Tacarigua (Map: Venezuela, D 1). Valencia is well constructed with broad streets, well-kept plazas, a beautiful market and alameda. It contains a notable cathedral erected during the first half of the nineteenth century. The city is on the banks of the Aragua River. The chief exports are coffee, sugar, cacao, and hides. Pop. (est.), 27,538. Valencia was founded in 1555. During the struggle for independence it was the scene of battles fought by Bolívar in 1814 and 1821, the latter of which gained the freedom of Venezuela from Spain. On account of the various sieges from 1810 to 1821 and the great earthquake of 1812, there are many ruins in the vicinity.

VALENCIA, DUKE OF. See NARVÁEZ, R. M.

VALENCIA, UNIVERSITY OF. A Spanish university, founded by the union (1411) of an episcopal foundation for theology (1345) and a

municipal school of arts, medicine, and civil and canon law (established shortly after). A papal bull confirmed the union about 1500. Several colleges were founded in the sixteenth century, the period of the greatest prosperity of the institution. From that century it sank in numbers and reputation. It was reorganized in the decade 1848-58, and has since grown to be one of the leading universities in the Kingdom, with faculties of philosophy, law, natural science, and medicine, and in 1913 some 1700 students.

VALENCIENNES, vā'lān'syēn'. The capital of an arrondissement in the Department of Nord, France, and a fortress of the second class, at the junction of the Rhondelle and the Scheldt, 30 miles by rail southeast of Lille (Map: France, N., J 2). Broad boulevards are laid out on the site of the old fortifications, which were demolished in 1892. There are many houses of the seventeenth century, which give the streets a mediæval appearance. The handsome Hôtel de Ville, pure seventeenth century except the façade, contains a large collection of paintings, especially of the Flemish school (including splendid specimens of Rubens), and a collection of sculptures. The Gothic church of Saint-Géry, dating from the thirteenth century, with a modern tower, and the church of Notre Dame du Saint-Cordon, a modern structure in thirteenth-century style, with beautiful stained-glass windows by Lévêque, are worthy of notice. In the old Jesuit College is the municipal library of more than 25,000 volumes, containing much valuable Romance literature. There are an academy for sculpture and painting, a museum of natural history, an immense hospital, a lycée, and an arsenal. The famous Valenciennes lace is no longer manufactured. The extensive coal fields amid which Valenciennes lies have made it a metallurgical centre. Glass, sugar (from beets), chemicals, cambrics, and lawns are also manufactured. Chicory coffee is shipped in large quantities. Pop., 1911, 34,766. Valenciennes is the Roman Valentiana. It came to France by the Treaty of Nimègue in 1678. It was taken by the Germans in August, 1914. See WAR IN EUROPE.

VALENCIENNES. See LACE.

VALENCIENNES, ACHILLE (1794-1865). A French zoologist, born in Paris and educated there. In 1836 he became professor of ichthyology at the Museum of Natural History. He collaborated with Cuvier in preparing *Histoire naturelle des poissons* (11 vols., 1829-49), the last five volumes being written solely by Valenciennes. Valenciennes wrote *Histoire naturelle des mollusques, des annélides et des zoophytes* (1833).

VALENCY (Lat. *valentia*, strength, from *valere*, to be strong, able; connected with OIr. *flaith*, power, Lith. *galeiti*, to be able, Goth. *waldan*, OHG. *waltan*, Ger. *walten*, AS. *wealdan*, Eng. *wield*), VALENCE, or ATOMICITY. In chemistry, the combining capacity of an atom, with reference to the number of other atoms with which it can be directly combined. The conception of valency is an offspring of the atomic and molecular theories. These theories led to a knowledge of the numbers of different atoms making up the molecules of compounds; but as in many cases very different compounds were found to have the same composition and the same molecular weight, it became clear that differences in the chemical and physical properties of compounds must often be caused by differ-

ences in the manner of combination of their atoms. Those differences of combination had to be investigated, and thus arose the question, In what manner does affinity act in holding together the atoms of compounds? In considering various compounds with a view to obtaining some light on this question, chemists were gradually led to a series of assumptions, the incorporation of which in atomic chemistry has proved exceedingly fruitful.

First of all it was observed that, in compounds of hydrogen with some one other element, one atom of hydrogen can hold in combination only one atom of the other element; this was shown by such compounds as hydrochloric acid (HCl), hydrobromic acid (HBr), hydriodic acid (HI), etc., and the fact was expressed by saying that hydrogen is univalent or monad. The valencies of certain other elements were then found by considering their compounds with hydrogen, on the principle that by every unit of their combining capacities the atoms of those elements can hold one atom of hydrogen; for hydrogen itself is univalent, i.e., has unit-combining capacity. From the compounds already mentioned it may be seen that the atoms of chlorine, bromine, and iodine are, like hydrogen, univalent; for each atom of these elements can be combined with only one atom of hydrogen. Similarly, compounds like water (OH_2), sulphureted hydrogen (SH_2), ammonia (NH_3), and marsh gas (CH_4) show that oxygen and sulphur are divalent, that nitrogen is trivalent, and that carbon is quadrivalent. The valencies peculiar to some of the elements being thus established by an inspection of their compounds with hydrogen, the valencies of the other elements can be found by studying their compounds not necessarily with hydrogen, but with any element of known valency. Thus compounds like sodium chloride (NaCl), potassium chloride (KCl), etc., show that the atoms of sodium and potassium are univalent; for they can hold in combination only one atom of another univalent element. The same thing is shown by the fact that sodium or potassium takes the place of one atom of hydrogen in acids, e.g., in hydrochloric acid:

Evidently, an atom of sodium or potassium is equivalent to an atom of hydrogen, and as the latter is univalent, the former, too, must be univalent. Similarly, an atom of calcium takes the place of two atoms of hydrogen:

and therefore the element calcium, or rather an atom of this element, is considered divalent.

Thus a few simple compounds and a few simple reactions led to a knowledge of the valencies peculiar to all of the elements. The conception of valency has proved especially useful in the domain of organic chemistry, i.e., the chemistry of the compounds of carbon. Our modern structural theory is based entirely on the assumption that an atom of carbon is invariably quadrivalent; and the usefulness of the structural theory can hardly be overestimated. For it exhibits in a clear and simple manner the relations between similar as well as different compounds, and, above all, it permits of determining the exact number of different compounds that may have

the same composition and the same molecular weight, and thus permits of foretelling the existence of compounds before they have been actually obtained.

Graphically each unit of combining capacity of an atom is represented by a dash added to its symbol. The valencies of different elements are thus denoted as follows:

When two atoms combine, at least one valency of each is employed, and in compounds like the following, the atoms are said to be linked together by single bonds, each bond evidently representing two valencies or affinities (i.e., one unit-combining capacity of each of the combining atoms):

The graphic representation of valency suggests an important question, viz.: Are the valencies of an atom forces acting only in certain directions, or do they act, like gravity, in all directions? A further question naturally suggests itself in the case of atoms having more than unit valency, viz.: Are the several affinities equal to one another in power? To answer these questions is a matter not of idle speculation, but of necessity in the case—again—of the compounds of carbon. The study of these compounds has led chemists to make the following assumptions: (1) the four valencies of carbon are in all respects equal; (2) they act in four different directions, which are perfectly symmetrical with respect to the carbon atom. The carbon atom is, viz., imagined to be placed at the centre of a regular tetrahedron, and four equal forces are assumed to act in the directions of the four vertices of the tetrahedron. A further assumption that thrusts itself upon the organic chemist is that in every compound capable of independent existence all the valencies of the constituent atoms are satisfied by combination, and that no valency is free. Without these working assumptions organic chemistry can make no progress. These assumptions made, there is hardly a general fact that remains unaccounted for. The assumptions, though hypothetical in character, are therefore incorporated as principles of science, and thus in connection with the compounds of carbon chemistry answers in a sense the question stated at the beginning of this article, viz.: In what manner does affinity act in holding together the atoms of compounds?

In the case of other elements than carbon, the application of the idea of valency has been much less useful and much less successful. In fact, the obstacles in the way of consistently applying the idea to the several elements are so great that the idea would probably have been abandoned long ago, were it not for its great usefulness in the case of carbon. The chief obstacles are as follows: First, the valencies of most elements are found to be variable and hence unreliable as a basis for predicting the constitution of unknown substances. Thus, while in ammonia (NH_3) the atom of nitrogen is trivalent (because combined with three univalent atoms of hydrogen), in nitric oxide (NO) it is divalent

(because combined with one divalent atom of oxygen), and in ammonium chloride (NH_4Cl) it is pentavalent (because combined with five univalent atoms, viz., four hydrogens and one chlorine). In other compounds nitrogen seems to have still other valencies. Turning to iron, we find it divalent in ferrous chloride (FeCl_2) and trivalent in ferric chloride (FeCl_3). Chlorine is univalent when combined with hydrogen, and quinquivalent when combined with oxygen. Sulphur is divalent when combined with hydrogen, and hexavalent when combined with oxygen. Phosphorus is trivalent when combined with hydrogen, and quinquivalent when combined with oxygen. Oxygen is divalent in nearly all of its compounds; yet in dimethyl ether hydrochloride oxygen must be assumed to be quadrivalent. Further, it has been stated above that the atoms of hydrogen, chlorine, iodine, and sodium were primarily assumed to be univalent. One might therefore expect that in all combinations of any two or three elements one atom of one would combine with one, and only one atom of the other. Yet the compound called trichloride of iodine has the formula ICl_3 . Is iodine trivalent in this compound? Another compound, a hydride of sodium, appears to have the formula HNa_2 . Is hydrogen in this compound divalent? And is, therefore, the valency even of hydrogen variable? Again, when we find the molecule of hydrogen gas to be made up of two hydrogen atoms, we conclude that the affinity of each of these atoms is satisfied by that of the other atom. But the molecules of certain univalent elements (the vapors of sodium, potassium, iodine, at high temperatures, etc.) are known to be made up each of a single atom. Are the affinities of these single atoms free? Or shall we accept the verdict of organic chemistry, according to which the molecule of a substance capable of independent existence can contain no free affinities? But then how can a single atom form a molecule?

While we thus search in vain for an explanation as to what becomes of affinities in certain compounds, we find that other compounds seem to involve the use of more valencies than those possessed by the constituent atoms. Examples of such compounds are presented by the innumerable known crystallohydrates, like $\text{NaCl} \cdot 2\text{H}_2\text{O}$, made up of several molecules within each of which all the available valencies should be expected to be satisfied. Other examples of this kind are presented by many of the minerals found in nature. Do atoms, then, possess additional valencies which sometimes do and sometimes do not come into play?

If, with all these unanswered questions in mind, we return to a consideration of the compounds of carbon—compounds for which the valency doctrine has rendered its best services—we find that really here also the assumption of the constancy of valence, viz., of the constant quadrivalence of the carbon atom, is by no means generally correct. In the first place we have the classic case of carbon monoxide: in this compound (CO) the carbon atom appears to be divalent; the only escape from this conclusion is by way of assuming that the oxygen atom is quadrivalent, which is but little more satisfactory than ascribing an exceptional valency to the carbon. In another compound, fulminic acid (HCNO), the carbon atom is quite certainly divalent. But the most striking examples of carbon acting with a valency other than four

are presented by triphenyl-methyl (first prepared by Gomberg) and a series of analogous substances discovered in recent years. Triphenyl-methyl is methyl, CH_3 , in which the three hydrogen atoms have been replaced by phenyl (C_6H_5) groups. But triphenyl-methyl is not a radicle; it is a compound leading an independent existence; therefore, the carbon atom to which its three phenyl groups are linked is indubitably trivalent—as much so as it would be in methyl itself, if methyl could be isolated as an independent compound.

In view of such facts, and notwithstanding the great services rendered by the old working assumption of the constant quadrivalence of carbon, there remains to-day no justification for thinking of valency as an immutable property of the atom; the combining capacity of an atom, of which its valency is a measure, must be recognized as capable of being diminished or increased under the influence of the other atoms, or groups of atoms, with which the given atom is linked. And recognizing this, we may well expect the birth of new classes of compounds, unknown to the older organic chemistry, and so the creation of a theory of such compounds becomes a matter of possibly the greatest practical importance.

This explains why in recent years so much speculation is being published concerning the ultimate nature of valency. A sound theory of valency, which such speculation may sooner or later introduce, will not only, as our purely formal valency doctrine has done, guide the chemist to the preparation of new compounds; it will answer the many questions which chemistry is now compelled to ignore, and it will give us the much-needed and long-sought insight into the constitutional peculiarities of benzol and its innumerable, and in many cases, immensely valuable derivatives. Consult J. A. N. Friend, *The Theory of Valency* (New York, 1909). See CARBON COMPOUNDS; CHEMISTRY; STEREOCHEMISTRY.

VALENS (c.328–378 A.D.). Roman Emperor of the East (364–378 A.D.). He was the brother of Valentinian I (q.v.), and was born near Cibalis, in Pannonia. He was associated with his brother in the Imperial authority, receiving as his share of the Roman world Asia, Egypt, and Thrace, in 364. His sovereignty was, however, disputed by Procopius, a supposed scion of the race of Constantine, who raised his standard in Thrace, was crowned at Constantinople, and for two years maintained his ground with skill and courage, till the defeat of his troops at Thyatira and Nacolea, followed by his capture and death in 366. The first prominent act of Valens's reign was a reduction of 25 per cent in the taxes. The prolonged imprisonment of 3000 Ostrogoths, who had been sent to aid Procopius, led to a war which lasted from 367 to 369. The contest was carried on in the country of the Goths and was throughout in favor of the Romans. Difficulties arose immediately afterward (370) with the Persians, who sought to occupy Armenia, although war was not declared till the end of 372, when the Romans were victorious. Valens, who had removed to Antioch at the beginning of the war, now occupied himself with the religious quarrels between the Arians and the orthodox party, which at that time raged with much violence over the whole Eastern Empire. Affairs on the eastern frontier again assumed a threatening aspect; but the Romans were disinclined any longer to interfere with the

designs of the Persians on Armenia, and concluded a somewhat discreditable treaty in 376. Meanwhile the Goths, who had for some time been peacefully settled in Dacia, were assailed by the advancing hordes of the Huns. The Ostrogoths, who first felt the shock, were partly incorporated, and the remainder forced to retreat; the Visigoths next attempted to stem the torrent, but without success, and crowds of fugitives gathered at the north bank of the Danube. Valens accorded permission to a large body of Goths under Fritigern to cross into Mœsia and Thrace, and take possession of the waste lands in these provinces; the fugitive Ostrogoths soon afterward crossed the river without permission; and the alarm which the numbers and turbulence of his new subjects speedily aroused led Valens to the adoption of such impolitic measures that the gratitude of the Goths for shelter afforded was turned to bitter resentment. Valens at last resolved on war, and engaged the Goths near Adrianople, Aug. 9, 378. His army was totally routed, and two-thirds of it, including Valens himself and most of his chief officers, were left dead on the field. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911), and Edward Gibbon, *The Decline and Fall of the Roman Empire*, chaps. xxv-xxvi (ed. of J. B. Bury, London, 1912).

VALENTA, EDUARD (1857-). An Austrian chemist, born in Vienna, where he was educated at the Polytechnic School and later became professor of photochemistry in the Graphic Educational and Experimental Institution. He received many honors. His numerous and important publications include: *Klebe- und Verdickungs-Mittel* (1884); *Die Photographie in natürlichen Farben* (1894); *Photographische Chemie und Chemikalienkunde* (2 vols., 1898-99); *Die Rohstoffe der graphische Druckgewerbe* (3 vols., 1904-14); and many contributions with Eder.

VALENTIA, vā-lén'shí-á, or **VALENCIA**. A small island off the southwest coast of Ireland noted as the eastern terminus of the submarine cables between Great Britain and America (Map: Ireland, A 8).

VALENTIA. One of the five provinces into which Britain was divided under Diocletian, covering the portion of Scotland south of the wall of Antoninus.

VALENTIN, vā-len-tēn, GABRIEL GUSTAV (1820-83). A German physiologist. He was born and educated at Breslau (M.D., 1832), where, with his teacher J. E. Purkinje (q.v.), he discovered ciliary epithelial motion. While professor of physiology at Bern (1836-81), he discovered the nuclei of cells (1836), and the diastatic rôle of the pancreatic fluid (1844), and he gave to medical science observations on many other important physiological phenomena. He wrote on the effect of poisons on animal organism, also *Lehrbuch der Physiologie des Menschen* (1844; 2d ed., 1847-50), and *Grundriss der Physiologie des Menschen* (1846; 4th ed., 1854).

VALENTINE. The name of several saints and martyrs of the Christian Church. According to the *Acta Sanctorum*, on February 14 is observed the day of seven of them, and the veneration of the head of an eighth. These martyrs had lived in various parts of the world—France, Belgium, Spain, Africa—but the two greatest were a priest at Rome and a bishop in Umbria, both of whom lived in the third cen-

tury. The legends which have been preserved in regard to them have little historical value. St. Valentine's Day is more famous, however, as a lovers' festival; this has no connection with the saints, but is perhaps the survival of an old festival, of a similar nature, in the Roman Lupercalia. It was observed particularly in England, but to a certain extent upon the Continent, too; mention of it is found as early as Chaucer. The custom was to place the names of young men and women in a box, and draw them out in pairs on St. Valentine's eve. Those whose names were drawn together had to exchange presents and be each other's valentines throughout the ensuing year. Later only the men made presents.

VALENTINE. 1. A character in Shakespeare's *Two Gentlemen of Verona*, one of the two whose humorous adventures give the play its title. 2. The brother of Gretchen in Goethe's *Faust*, by whom he is killed while trying to avenge the family honor.

VALENTINE. A sentimental romance by George Sand (1832).

VALENTINE, BASIL. The pseudonym under which Johann Thölde published in 1644 a work entitled *Halographia*. For the origin of the name see VALENTINUS, BASILIUS.

VALENTINE AND ORSON. A Carolingian romance, written in the second half of the fifteenth century and printed at Lyons in 1495. It narrates the history of twin brothers, sons of the Emperor of Constantinople. Orson grows up as a savage denizen of the forest, but Valentine is found by his uncle, King Pepin, and is trained at the palace to be a finished courtier. In 1589 Hathaway and Munday wrote a play founded upon the story, and six years later an interlude bearing the same title was produced.

VALENTINER, vā-len-tē'nēr, WILHELM (1880-). A German art historian and critic and museum official. He was born at Karlsruhe (Baden), and studied at Heidelberg under Thode, and in Holland with De Groot and with Bredius, whose assistant he was at the Gallery of The Hague. In 1905 he was called to Berlin by Wilhelm Bode (q.v.), under whom he worked at the Kaiser Friedrich Museum and Kunstgewerke Museum. In 1907 he was appointed curator of the department of decorative arts in the Metropolitan Museum (New York), which under his supervision became one of the foremost in the world. After service at the front in the European War he was, in 1916, attached to the general staff at Berlin. Especially known through his writings on Flemish and Dutch painting, he published: *Rembrandt* (1907), and *Altholländische Genre Zeichnungen* (1908), both with Bode; *The Art of the Low Countries* (1914); *The Last Years of Michelangelo* (1914). He also wrote important catalogues, including that of the Hudson-Fulton Loan Exhibition, *Dutch Masters of the Seventeenth Century* (1909).

VALENTINE VOX, THE VENTRILOQUIST. A lengthy and once popular novel by Henry Cockton (1840), abounding in farcical situations produced by the hero's use of his gift.

VALENTINIAN. A romantic drama by Fletcher produced before 1618-19, but not printed until 1647. It contains some very beautiful songs.

VALENTINIAN (VALENTINIANUS). The

name of three Roman emperors of the same family. The most famous, VALENTINIAN I (364-375 A.D.) was the son of humble parents, and was born at Cibalis, in Pannonia, in 321. Valentinian entered the army at an early age, and rose rapidly in rank under the emperors Constantius and Julian, only, however, to fall more rapidly; for he was degraded by Constantius in 357, and banished by Julian in 362. Restored to favor in 363 he distinguished himself in the East, and on the death of Jovian was unanimously chosen as his successor (Feb. 25, 364). A month after his accession he chose as his colleague his brother, Valens (q.v.), to whom he resigned the government of the East, reserving for himself Illyricum, Italy, the Gauls, Britain, Spain, and Africa. During Valentinian's reign the Alemanni repeatedly (366-368) ravaged the east and the Saxons (370) the northeast of Gaul; Illyricum was wasted (370) by the Quadi and Africa by the southern desert tribes, though these invasions were mostly repelled and avenged. The internal administration, on the other hand, was excellent, for the Emperor added to his ability prudence and firmness, vigilance and impartiality. Though himself a zealous Catholic he permitted his subjects to adopt whatever religion they chose, and strictly forbade all persecution or annoyance on account of religious belief. On account of the abuse of ecclesiastical influence he excluded priests and monks from the right of succession to property; it was forbidden to hold judicial proceedings in private; the extreme license of speech hitherto allowed to advocates was restrained; gratuitous medical attendance was provided for the poor of Rome; and schools were established throughout the Empire. The success of his administration was doubtless much owing to his fortunate choice of officers: Theodosius the Elder in Africa and Britain, Jovinus in Gaul, and Theodosius the Younger (afterward Emperor) in Illyricum. In private life Valentinian was above reproach, except for his violent temper. By his first wife he had one son, Gratianus (q.v.); and by the second, Justina, a son, Valentinian, and three daughters, one of whom, Galla, became the wife of the Emperor Theodosius I.

VALENTINIAN II (375-392 A.D.), the younger son of the preceding, was born 372 A.D., and received from his elder brother, Gratianus (q.v.), the provinces of Italy, Illyricum, and Africa as his share of the Western Empire. During his long minority the Empress Justina administered the government; and about three years after her death Valentinian, who had given promise of good administrative qualities, was murdered at the instigation of the Frank, Arbogastes, the commander in chief of his army.

VALENTINIAN III (425-455 A.D.), the grand-nephew of the preceding, was born about 419 A.D. and was seated on the throne of the West by Theodosius II, Emperor of the East, in 425. Valentinian was a weak and contemptible prince and may be said never to have ruled during the 30 years that he sat on the Imperial throne; his mother, Placidia, governed till her death in 450, and she was succeeded by the eunuch Heraclius. The regulations enacted for the internal administration were creditable, and especially so when ecclesiastical interests were involved, but the utter corruption of manners, the complete extinction of public spirit, the exactions of the tax collectors and commis-

sioners, the employment of the powers of the executive in the avenging of private quarrels, and the impossibility of obtaining redress for injuries showed that the Empire had fallen far beyond remedy. The early part of Valentinian's reign was disturbed by the contests between the comites Bonifacius and Aëtius (q.v.), the former of whom had supported and the latter resisted Valentinian's claims to the throne; but notwithstanding this, Aëtius prevailed upon the Empress to declare his rival, the Governor of Africa, a public enemy; and the latter called to his aid the Vandals under Genseric (q.v.). Thus Africa was lost to the Empire. But Aëtius, notwithstanding, proved himself the bulwark of the Roman power in Europe; the Franks, Goths, Burgundians, and other German nations who had encroached on the Empire were successively defeated and repelled, and the advance of the Huns was stayed on the field of Châlons. Yet the labor of defending an extensive empire from attack on all sides was too much for one man; and much of Spain and Gaul was seized by the Suevi and the Visigoths, the north of Italy was ravaged by the Huns, Sicily and Sardinia by the Vandals, and even Rome was repeatedly besieged, while Britain was abandoned to the Picts and the Scots. Aëtius seems to have committed the same error as his predecessor Stilicho (q.v.) in attempting, by the marriage of his son to Valentinian's daughter, to transfer the Imperial dignity to his own family, and, like him also, he was assassinated, though by the sword of his master (454). In 455 Valentinian was murdered by adherents of Petronius Maximus and of Aëtius. Consult: H. Richter, *Das Weströmische Reich unter den Kaisern Gratian, Valentinianus II, und Maximus* (Berlin, 1865); H. Schiller, *Geschichte der römischen Kaiserzeit*, vol. iii (Gotha, 1883-87); Thomas Hodgkin, *Italy and her Invaders* (Oxford, 1892); *The Cambridge Medieval History*, vol. i (New York, 1911); Edward Gibbon, *The Decline and Fall of the Roman Empire*, chapters xxv, xxvii, xxxiii-xxxv (ed. of J. B. Bury, vol. i, London, 1912); the article "Valentinianus," in Friedrich Lübke, *Reallexikon des Klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

VALENTINIANS. The most important Gnostic sect or school, founded by Valentinus, who went from Alexandria to Rome about 140 A.D. and died there, or in Cyprus, about 160. They recognized heathenism as a preparatory stage of Christianity, and divided the higher spiritual world into 15 pairs of æons, each consisting of a male and a female. The first pair, or syzygy, is made up of Bythos, or God in himself, and Ennoia, or God as existing in his own thoughts; from these emanated next Nous (Intelligence) and Aletheia (Truth), and so on. As the last æon, Sophia (Wisdom), transgressed the bounds that had been laid down by the æon Horos, and a part of her being became lost in Chaos, there was formed a crude being, called Achamoth, which, through the Demiurgos that emanated from it, created the corporeal world. Horos now imparted to the souls of men (for all the bodies composing the corporeal world are possessed of souls) a pneumatic or spiritual element, but this only attained to full activity when Christ, a collective emanation from all the æons, appeared as Saviour, and united himself with the man Jesus. In the end, all that is spiritual, and even the

originally psychic or soul element in so far as it has assimilated itself to the spiritual, will return into the Pleroma. The Valentinians existed as late as the second half of the fourth century. See Gnosticism.

VALENTINUS (?-c.160). The founder of one of the Gnostic sects which came into existence in the first half of the second century. According to Epiphanius (*Hær.* xxxxi, 2) he was born in Egypt, as some assert, of Jewish parents, and was educated in the Hellenic schools of Alexandria. During the reign of Antoninus Pius (about 140) he came to Rome, where he first appeared as an orthodox religious teacher. On his settling in Cyprus he became an open enemy to the Church and began to propagate his peculiar doctrines, for which see Gnosticism; Valentinians.

VALENTINUS, BASILIUS. A German chemist and physician who lived in the latter part of the fifteenth century. Numerous writings, purporting to come from him, have been preserved, but in regard to his life the obscurity is so great that some extremists have even denied his existence, saying that the name is a pseudonym of Paracelsus (q.v.), with whom his works show great resemblance. Sounder scholars, however, maintain that he did live, having been born in Alsace, and being a Benedictine monk. His writings show a position midway between alchemy and modern science. The most complete edition of them is that published by Petrus (Hamburg, 1740).

VALERA Y ALCALÁ GALIANO, vā-lā'rá ē āl'kā-lā' gā'lē-ā'nō, JUAN (1824-1905). A Spanish statesman, diplomat, novelist, poet, and scholar, born at Cabra, in the Province of Córdoba. He was educated at Malaga and at the University of Granada, where he took his degree in law, and then entered upon a diplomatic career (1847). When the Duke de Rivas was sent as Spanish Ambassador to Naples Valera accompanied him. He was then a member of the Spanish legations at Lisbon (1850), Rio de Janeiro (1851-53), Dresden and St. Petersburg (1854-57). After his return to Madrid (1858) he became one of the editors of the liberal journal *El Contemporáneo* (1859). He was a leading member of the Unión Liberal, and was made Minister to Frankfort (1865) by General O'Donnell. After the revolution of 1868 he was appointed Assistant Secretary of State and (1871) Director of Public Instruction. During the reign of Alfonso XII he was Minister to Lisbon (1881-83), Washington (1883-86), and Brussels (1886-88), and in (1893-95) Ambassador to Vienna. Throughout all his diplomatic and political activity he produced works which rank among the highest that his country's literature contains. He was elected to the Spanish Royal Academy of the Language (1861) and to the Academy of Moral and Political Sciences (1900). He became life Senator (1881) and Knight Grand Cross of the Order of Carlos III (1882).

Valera really began the movement in fiction that was the glory of the last three decades of the nineteenth century in Spain with his *Pepita Jiménez*, first published as a serial in 1874 and since translated into many modern languages. *Pepita* was written after Valera had steeped his mind in the Spanish mysticism of the sixteenth and seventeenth centuries. His next novel, *Las ilusiones del doctor Faustino* (1875), the story of a modern Faust, did not

catch the popular favor so quickly as *Pepita*. His third novel, *El comendador Mendoza* (1877), is free from philosophizing. After a shorter story, *Pasarse de listro*, appeared the *Doña Luz* (1879). Having abandoned politics, Valera wrote *El hechicero*, *Juanita la larga*, *La buena fama*, *Genio y figura*, *De varios colores*, and *Morsamor*, all attractive novels. The short tales of Valera are hardly less known and appreciated than his more extended works. Among them are the *Cuentos, diálogos y fantasías*, the delightful little *El pájaro verde*, the *Parsondes*, the *Asclepigenia*, the *Gopa*, and the *Bermejino prehistórico*. In the poetry of Valera his erudition is more visible than any other trait. By translating or paraphrasing in verse the poems of foreign authors, Valera acquainted his countrymen with portions of the poetic literature of Germany and the English-speaking regions; thus he rendered into Spanish verse parts of Goethe's *Faust*, of Uhland's ballads, and of Moore's *Paradise and the Peri*; poems of James Russell Lowell, Whittier, and W. W. Story. His translation of that gem of antiquity *Daphnis and Chloe* has itself become a classic. He also translated Schack's *Poesie und Kunst der Araber* (1881). His critical work displays great powers of observation, and gives evidence of wide reading. For purity of diction and beauty of style Valera has never been surpassed in Spain.

Consult: Juan Valera, *Obras Completas* (Madrid, 1905 et seq., 43 vols. to 1916); Ferdinand Brunetiere, *La casuistique dans le roman de Juan Valera*, in his series *Histoire et littérature*, vol. i (Paris, 1884); Emilia Pardo Bazán, "Retratos y apuntes literarios," in *Obras completas*, vol. xxxii (Madrid, 1891 et seq.); Conde de Casa Valencia, *Necrologia de . . . D. J. V.* (ib., 1905); Conde de las Navas, *Don Juan Valera* (ib., 1905); J. D. Fitz-Gerald, "Juan Valera," in *The Bookman*, vol. xxi (New York, 1905); F. Vézinet, *Les maîtres du roman espagnol contemporain* (Paris, 1907).

VALERA Y DELAVAT, vā-lā'rá ē dā'lā-vāt', LUIS, MARQUIS DE VILLASINDA (1870-1927). A Spanish diplomat and novelist, son of Juan Valera y Alcalá Galiano (q.v.). He served as Secretary of Legation at Peking, as Minister to Morocco, and as Minister to Portugal. Among his works are: *Sombras chincas* (1902); *Visto y soñado* (1903); *Del Antaño Quimérico* (1905); *El filósofo y la tiple* (1908); *De la muerte al amor* (1910).

VALÈRE, vā'lār'. A stock name for a lover in French classical comedy. In Molière's *L'avare* he is the son of Anselme and lover of Élise, Harpagon's daughter. The character occurs also in *Le dépôt amoureux*, *L'école des maris*, and *Le médecin volant*, and in Mrs. Centlivre's *Gamester*.

VALERIAN, vā-lē'ri-an (OF. *valeriane*, Fr. *valériane*, from ML. *valeriana*, *valerian*; probably from Lat. *Valerianus*, prop. name, from *valere*, to be strong, able), *Valeriana*. A genus consisting of about 180 species of annual and perennial herbs of the natural order Valerianaceæ. The common valerian (*Valeriana officinalis*) is abundant in ditches, moist woods, etc., throughout Europe and northern Asia. Its fleshy root (*valeriana rhizoma*) has been used in medicine as an antispasmodic and a stimulant to the nervous system and circulation—actions attributed to valerianic acid.

The active ingredient is a crystallizable vola-

tile oil, from which is obtained by oxidation valerene ($C_{10}H_{16}$), valerol ($C_{12}H_{20}O$), also known as Baldrian camphor; and valerianic acid ($C_{15}H_{26}O_2$). The latter as a pharmaceutical product is derived from amylic alcohol by oxidation and is not identical with the natural acid. There are three official preparations, viz., the fluid extract, the tincture, and the ammoniated tincture. The volatile oil is not official, but is preferable to the tinctures which are extremely nauseating to many patients. In toxic doses valerian produces diarrhoea, vomiting, and mental disturbances.

The greater valerian (*Valeriana phu*), which grows in alpine districts of Europe, is now almost entirely disused, although, like *Valeriana dioscoridis*, it is very active. *Valeriana celtica* and *Valeriana salicina*, are alpine species, found in Styria and Carinthia. *Valeriana sitchensis*, a native of the United States, is said to possess medicinal properties. The root of *Valeriana edulis*, a species found in northwestern America, is used as food by the Indians.

VALERIAN (PUBLIUS LICINIUS VALERIANUS). Roman Emperor 253-260 A.D. He was descended from an ancient and noble family, and was chosen for his integrity and accomplishments to the office of censor. Faithful in his allegiance to Gallus, he went to summon the legions of Gaul and Germany to aid the feeble Emperor against the usurper Æmilianus, but arrived too late to save his master. The usurper's troops murdered their own chief, and united with their late antagonists in proclaiming Valerian Emperor, August, 253. He was then about 60 years old, and took as colleague his eldest son, Gallienus (q.v.). Valerian showed abundant proof during his short reign of most ardent zeal for the prosperity of the Empire, but the times required a ruler of more energy and ability, as the irruption of the Franks into Gaul, despite the efforts of Aurelian, the devastation of Thrace, Macedonia, Greece, and the archipelago by the Goths, the advance of the Alemanni to Milan, and the conquest of Syria and Armenia by the Persian King Sapor (Shapur), testified. Since the troubles in the East appeared most threatening, Valerian went thither in person, and was for a time successful, but was surprised by superior numbers at Edessa, was defeated, and with the remnant of his army forced to surrender (260 A.D.). Valerian remained in captivity till his death. The statements regarding the indignities heaped upon the unfortunate captive by his haughty conqueror are probably false, or at least much exaggerated. After his death his skin was flayed off, stuffed, and preserved as a proud trophy of victory, which was invariably exhibited to the ambassadors from Rome to the Sassanid court.

VALERIANOS, vá'lá-ré-á'nas, APOSTOLOS. See FUCA, JUAN DE.

VALERIC (vá-lér'ík or -lér'ík) or **VALERIANIC ACID**. A name applied to four distinct volatile fatty acids, all represented by the same formula, $C_8H_{16}CO_2H$. The valerianic acid ordinarily met with, and used pharmaceutically, is often referred to as iso-valerianic acid. It is a limpid, colorless, oily fluid of a penetrating odor, similar to that of valerian root, and of an acrid taste. It boils at 174° C. (345° F.). It makes a transparent spot on paper, but the spot disappears on exposure to the air. It is only slightly soluble in water, but dissolves in

alcohol and ether in all proportions. It exists in and is obtained by distilling valerian root with water acidulated with sulphuric acid. It may be similarly obtained from angelica root. It is also formed during the oxidation of fats and fatty acids (especially oleic acid), either by nitric acid or mere exposure to the air, by the oxidation and putrefaction of albuminoids, etc.; but the best method of preparing it is by distilling a mixture of amyl alcohol (or fusel oil) with bichromate of potash and sulphuric acid. An amino derivative of this acid, having the formula $C_8H_9(NH_2)CO_2H$ and named valine, is of considerable importance in biological chemistry.

The following salts are used in medicine: (1) Valerianate of ammonia, which forms colorless, or white, flat quadrangular crystals that are deliquescent in the air. (2) Valerianate of iron, a dark-red amorphous powder which is readily soluble in alcohol, but is insoluble in cold water. (3) Valerianate of zinc, which forms brilliant white pearly tabular crystals, with a feeble odor of valerianic acid and a metallic taste, is scarcely soluble in water, in alcohol, or in ether. Valerianic acid and its salts are supposed to be useful remedies for reflex neuralgia and for various neurotic troubles; but what their action consists in is entirely unknown. Amyl valerianate, $C_5H_{11}C_8H_{17}O_2$, is a volatile fluid with a penetrating odor of apples, slightly soluble in water, but dissolving freely in spirit and in ether. In the form of a dilute spirituous solution, it so strongly resembles apples in its smell that it is used in perfumery under the name of oil of apples, or essence of apples.

The three other known valerianic acids are of much less importance than the one described above.

VALERIUS ANTIAS. A Roman historian of the first century B.C., who wrote the history of Rome from the earliest times down to those of Sulla. This work, which consists of at least 75 books, was full of exaggerations, but was mentioned among the well-known annals, and was one of the chief sources of Livy, who mentions Valerius by name repeatedly, and followed him unhesitatingly in the first decades of his work. Consult: H. Peter, *Historicorum Romanorum Fragmenta* (Leipzig, 1883), for the fragments of the *Annales*; W. S. Teuffel, *History of Roman Literature* (Eng. trans. by G. C. W. Warr, London, 1891); Martin Schanz, *Geschichte der römischen Litteratur*, vol. i, part ii (3d ed., Munich, 1909).

VALERIUS CORVUS, MARCUS. See CORVUS, M. V.

VALERIUS FLAC'CUS. A Roman scholar and teacher. See FLACCUS, GAIUS VALERIUS.

VALERIUS MAXIMUS. A Roman historical compiler of the reign of Tiberius, to whom he dedicated a work bearing the title of *Factorum et Dictorum Memorabilium Libri IX*, and consisting of short stories and anecdotes from various authors. His style is ornate and often obscure, and his want of acquaintance with the history and constitution of his country renders him an unsafe guide; yet he was a favorite author of his own time, and much studied in the Middle Ages. The best edition, including the two epitomes by Julius Paris and Januarius Nepotianus, is that of Kempf (Leipzig, 1888). There is an old English translation by Speed (London, 1678). Consult W. S. Teuf-

fel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1909); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part ii (3d ed., Munich, 1913).

VALERIUS PROBUS, MARCUS. See **PROBUS**, M. V.

VALESIUS, HENRICUS (HENRI DE VALOIS) (1603-76). A classical scholar, born in Paris. He was chosen by the clergy of France to publish an edition of all the Greek authors whose writings deal with the early history of the church, and, in 1654, he was given a pension and the title of Royal Historiographer. His publications include the ecclesiastical histories of Eusebius, Socrates, Sozomen, Theodoret, and Evagoras, all of which were accompanied by Latin translations and scholarly introductions and notes (1659-73); a collection of excerpts from the Greek historians, especially Constantine Porphyrogenitus, known as the *Excerpta Peiresciana* (1634), and an edition of Ammianus Marcellinus (1636). His minor works were published under the titles *H. Valesii Emendationum Libri V* and *De Critica Libri II* (1740).

VALETTA, vā-lēt'tā. The fortified capital of Malta, located on the east side of the island (Map: Italy, E 7). The city is on a tongue of land, which forms two harbors and terminates in a narrow promontory bearing the lighthouse and fort of St. Elmo. In addition to St. Elmo there are three other important fortifications, government and private dry docks, a coaling station, a marine hospital, and quarters for troops. The principal architectural features are the governor's residence, formerly the palace of the grand masters of the Knights of Malta or St. John, and the cathedral, containing tombs of the Knights. The town has a university, library, botanical garden, and museum. In parts of the city the streets are broad and run at right angles to each other; in others the land is so steep that the streets are practically stairways. Valetta has a large transit trade, and is an important British naval station. Pop., 1901, 22,680; 1911, 22,882. In 1565 Valetta withstood a memorable siege by the Turks, against whom it was successfully defended by Jean Parisot de la Valette (q.v.). See **MALTA**.

VALETTE, vā-lēt', **JEAN PARISOT DE LA** (1494-1568). Grand Master of the Knights of St. John of Jerusalem (q.v.). He was born in Toulouse, and at an early age entered the Order of St. John. His chief distinctions were won in naval service in the Mediterranean. In 1557 he was elected Grand Master, the forty-eighth to hold that office. During the first five years of his grandmastership he captured 50 great galleys from the Turks, and a large number of smaller vessels of war. In May, 1565, a Turkish fleet said to have been composed of 150 ships, conveying 30,000 troops, appeared off the harbor of Malta, and after failing in several assaults, formally invested the island. Alone and unsupported by any of the Christian Powers, La Valette, with about 700 knights and 8000 men at arms and islanders, defended the fortress under circumstances of extreme difficulty and distress. At the end of four months, and after a loss, it is said, of 20,000 men, the Turkish fleet was forced to raise the block-

ade and withdraw from the island. La Valette died three years later, Aug. 15, 1568. Consult Jurien de la Gravière, *Les chevaliers de Malte et la Marine de Philippe II*, vols. i-ii (Paris, 1887).

VAL'GIUS RU'FUS. A Roman poet of the Augustan age. Horace (Sat. i, 10, 82) mentions him among those friends whose commendation outweighs the criticisms of detractors. He is said to have written elegies, epigrams, and works on botany and grammar. Consult Peter, *Historicorum Romanorum Fragmenta* (Leipzig, 1883).

VALHALLA, vāl-hāl'la (Old Norse *valhöll*, gen. *valhallar*, hall of the slain). In Old Norse mythology, the abode of Odin in Asgard, the hall of the fallen in battle. It stood in Gladsheim (Old Norse *Gladhsheimr*), the home of joy. The roof of it was of gold, and in front of it was the grove Glasir, the trees of which bore golden leaves. Before the house, which was so high that its summit could scarcely be seen, a wolf was hung, as a symbol of war, over which sat an eagle. The hall itself, ornamented with shields, wainscoted with spears, and lighted with shining swords, had 540 doors, through each of which 800 heroes could walk abreast. Every morning they marched out at the crowing of the cock, and fought furiously with one another; but at midday all wounds healed, and the heroes assembled to the feast under Odin's presidency. The guests ate of the bacon of the boar *Safrimnir*, and refreshed themselves with beer and mead, which flowed in abundance from the udder of the goat Heidrun (Old Norse *Heidhrunnr*), fed by the tree Lærad (Old Norse *Læradhr*) which rose above the hall, while the attendant Valkyries handed them the drinking horns, under Freyja's direction. See **ODIN**; **VALKYRIES**. Consult R. B. Anderson, *Norse Mythology* (Chicago, 1875; 7th ed., ib., 1901).

The name Valhalla is also given to a German temple of fame, situated about 7 miles east of Regensburg, Bavaria, on the heights above the Danube valley. This singularly beautiful and imposing structure was erected under Louis I. It was designed by Klenze, and completed in 1842. It is built of gray marble, in close imitation of the Parthenon, and is 246 feet long and 115 feet wide. Fifty-two Doric columns surround it. The interior is Ionic, forming a hall 50 by 180 feet and 56 high. Schwanthaler, Wagner, and Rauch had charge of the decorative features. The number of busts of eminent Germans in 1911 was 165, and there are six Victories (goddesses, by Rauch).

Consult: King Ludvig I, *Walhallas Genossen* (Munich, 1842; 1d ed., ib., 1847); Adalbert Müller, *Donaufaß und Walhalla* (33d ed., Regensburg, 1898); Schratz, *Kurze Geschichte und Beschreibung der Walhalla und des Markts Donaustauf* (8th ed., ib., 1904).

VALHORN, JOSEPH GASSER VON. See **GASSER VON VALHORN**, JOSEPH.

VALIANT-FOR-TRUTH. A character in the second part of Bunyan's *Pilgrim's Progress*, who joins the company of Christians on her journey to the Celestial City. He combines the noble qualities of a mediæval crusader with the homely virtues of the English middle classes of the seventeenth century.
